Deglet Noor Date Offshoots From Algeria

TWO large shipments of offshoots of the famous Deglet Noor variety of the date palm have just reached New York, 103 cases on the steamship Silene and 77 cases on the Urbino, all consigned to the United States department of agriculture. These offshoots are being shipped to Los Angeles and should reach the government date garden at Indio by the end of August.

In order to safeguard the future of the date growing industry in the United States and in particular to make Deglet Noor offshoots available to small growers or to farmers who may in the future desire to grow dates, the department of agriculture secured permission from the Algerian government in the spring of 1921 to import 1,400 offshoots of the Deglet Noor variety this year.

The department has entered into a contract with a local firm of date growers of Indio by which they undertake to root these offshoots, plant them out in permanent orchard form and return to the department one-fifth of the offshoots produced on the imported trees, and sell three-fifths of the offshoots to bona fide date growers living in regions suitable for the culture of the Deglet Noor variety and who do not already have 100 trees of this variety, at a price not to exceed $7.50 each for the unrooted offshoots. One-fifth of the offshoots are to go to this firm as their share, in view of their having borne all the expenses of this introduction. Further details as to the disposition of the offshoots produced by this new importation can be secured by addressing the Office of Crop Physiology and Breeding Investigations, Bureau of Plant Industry, U. S. Department of Agriculture, Washington, D. C.

Date palms, unlike other fruit trees, cannot be propagated by budding or grafting, but can be reproduced only from offshoots produced at the base of the stem in limited numbers during the first few years of the life of the mother tree. After the mother tree reaches the age of 12 to 15 years, no more offshoots are produced.

In 1900 the department made the first large importation of offshoots of the finest date that reaches the European market, the famous Deglet Noor variety which grows in the oases of the Sahara in southern Algeria and southern Tunisia. For some years this variety did not ripen well in the southwestern United States, but finally in 1910 methods of curing were perfected by the experts of the University of Arizona and the department of agriculture. Large importations of Deglet Noor offshoots were made by the Coachella Valley Date Growers Association from 1912 to 1914, with the cooperation and help of the department. After the war broke out the Algerian government placed an embargo upon the export of date offshoots from Algeria and no further importations of this variety could be made.

This importation of offshoots of the Deglet Noor variety, together with the importation made last year of the Saidy variety from Egypt will place at the disposal of date growers of this country for the next 15 to 20 years a large supply of offshoots of these two standard varieties at very low prices. For the present no more importations are contemplated.

Pasteurization Preserves Sweet Cider and Grape Juice

SWEET cider or grape juice can be preserved in a sweet condition indefinitely if the directions furnished by specialists in the bureau of plant industry, United States department of agriculture, are carefully followed.

As rapidly as the juices are pressed from the fruit place them in clean vessels. Wooden barrels or tubs which have previously been thoroughly scalded will serve the purpose very well, although earthenware jars, if available, should be used. These are allowed to stand over night, or for not more than 12 to 14 hours, in the coolest location possible so that much of the solid matter suspended in the juice will settle to the bottom. Glass jars or bottles must be thoroughly sterilized to receive the juices, which are drained off without disturbing the sediment.

If fruit jars are used they should be fitted with sterilized caps and rubbers and the cap tightened down as far as it can be turned. If bottles using crown caps are used, the bottles are capped as they are filled, using caps which have been sterilized. In case bottles closed with corks are used, set the previously sterilized corks in place in the bottles and tie them down loosely with strong cord so that steam may escape. To relieve the pressure during sterilization the bottles should be filled only to the neck.

A wash boiler or other convenient vessel can be prepared for a "water bath" by fitting it with a wooden rack on which the containers filled as above indicated with juice are placed. The bath is filled with cold water and the bottles or jars, if closed, are inverted or laid on one side so as to wet the inside of the caps thoroughly with juice. If bottles closed with corks are used, the bottles must stand upright in the water, which should come up to the necks of the bottles.

The heating is then started. A thermometer is hung so that it will dip for half its length into the water, which is heated gradually until its temperature reaches 175 degrees Fahrenheit. Allow the bottles or jars to remain in the water for 30 minutes if quart or half gallon jars are used, and from 40 to 45 minutes if gallon bottles are used. Then remove from the stove and immediately tighten down the caps of the jars, if jars are used. If corked bottles are used, drive the corks firmly into the necks; invert each bottle so as to wet the cork thoroughly with the hot juice; then complete the sealing by cutting the cork off smoothly and pouring hot paraffin over it.

Place the product in a dark, cool storage room. Watch it for a period of a week or more for the beginning of fermentation, which will be indicated by frothing at the surface of the liquid. If any bottles show signs of fermenting, return them to the wash boiler and repeat the process exactly as before, loosening the top, of course, before heating begins, and closing down firmly again before the liquid is allowed to cool.

When the juice is placed in storage the suspended solid matter will gradually settle out and sediment will accumulate in the botom and on the sides of the jars. In the course of two or three months at ordinary temperatures this settling will be completed and the liquid will be fairly clear. It may be used directly from the bottles or drawn off into clean bottles which should be sterilized before they are filled and which should then be corked and pasteurized by heating to 170 degrees Fahrenheit for the same length of time as in the first pasteurization. If rebottling is necessary or desirable the second heating should never reach the temperature to which the juice was first heated; otherwise, the clarification which is secured by settling and decanting into new containers will be defeated, as a second process of sedimentation will occur. If the temperature be kept five degrees below that reached at the first heating, this result will be avoided.

A reliable thermometer is a necessity for this work as it is important that the juice be heated to 175 degrees Fahrenheit in the first heating in order to destroy the organisms which would otherwise cause fermentation. It is equally important that the juice should not be overheated, as this will give it a cooked taste which is decidedly unpleasant to many people.

Owners Who Spray Have Orchards That Pay

There's no doubt about it—now. Citricola and black scale in Southern California can be overcome—and red spiders routed—with Balfour, Guthrie & Company's patented formulas for spraying. Your trees—like those our experts sprayed on 20,000 acres in Tulare County—can produce fancy packs and bigger profits.

It is not too late to succeed with this year's crop. But you must start spraying **now.** You don't have to experiment. You can take advantage of the field tests that already have proved the superior merits of

B. T. S. TRIUMPH GLUE (for citricola and black scale)	15 lbs. 1½ to 2½ gals. 1 lb.	Per 200 gal. Tank	B. T. S. TRIUMPH GLUE (for red spiders)	10 to 12 lbs. 1 gal. 1 lb.

(patented formulas)

Scale infested trees, as you know, set much less fruit. By spraying NOW with our tested materials, you save your foliage and fruit from the honeydew and that black, sooty fungus later.

Write or call at our headquarters in the H. W. Hellman Building, Los Angeles. Frank B. Herbert, assistant entomologist and his aides will examine your grove free of charge. They will tell you the right spray to use and how to use it. To get best results, spray today.

A new bulletin on citrus spraying by our expert entomologist, Paul R. Jones, is yours for the asking.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dog Has Worms

My dog about one year old has been bothered with worms. What is good to rid him of them?—Subscriber, Madera.

Have your druggist prepare ten powders, each containing ten grains of areca nut, and ten powders each containing five grains of santonin. Give one powder of the areca nut every norning in half a cup of sweet milk and one powder of the santonin every night by putting it well back on the tongue, There is very little taste to either of the medicines and you will probably have very little trouble in giving them.

Cory's Thornless

I am thinking of planting two acres of Cory's Thornless berries. I would like to hear from those who have tried them. I can irrigate them whenever necessary—Subscriber, Tulare.

Will be glad indeed to hear from any of our readers who have had experience, especially those who have failed in producing profitable crops, as we have had several commendatory articles. Articles will be much more valuable to our Tulare subscriber if writers will give conditions under which success or failure resulted from the planting of this berry.

Scorpions

Do we have the real scorpion here in the foothills? In the mining claims and sometimes around the house we have seen a bug that looks just like the scorpion you see pictured in the dictionary. If they are scorpions, are they poisonous? They are not longer than an inch and have pointed tail turned up over the back. We found two in the house and I feel worried for fear they might do us harm.—Subscriber, Oroville.

Presumably our inquirer is referring to the scorpion which is common in California. Its sting results in considerable pain and the pests are not pleasant neighbors. However, there is no occasion for fear of serious results.

Dogs Eat Chickens and Eggs

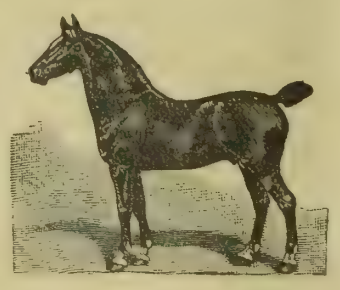
I have broken two dogs, an Irish terrier and a Boston bull, who is still with us, of the habit of killing chickens, and it is as simple as effective. When you catch your dog having killed a chicken, show it to him. Then tie the dead chicken to its neck and keep the dog tied in a place where everybody can see him. If the dog is a real dog he will not touch a chicken, live or dead, again. My dogs live with the chickens, babies and big ones. They eat from their plate and go in their kennel.

As to eating eggs, Yankee Girl is fond of them only when she is going to have babies. I suppose her system needs eggs, so we keep her tied from the time the chickens start laying till the last egg is gathered. I drop an egg well beaten in her milk every other day and a good dish of meat in the evening. After her litter is down she does not show any desire for eggs.

Hope this will prove as satisfactory to our fellow subscribers as it has been to us. I like the Cultivator very much and find it a very useful and pleasant magazine.—Mrs. W. F. Wheeler, Colton.

A flat duty of not less than 30 cents a pound on wool, clean content basis, is asked by the American Farm Bureau Federation wool marketing committee in resolution adopted August 2 at Chicago to be presented to the senate finance committee.

Keeping Your Horse IN Perfect Condition



NO horse with a Spavin, Splint, Ringbone, Curb, Bony Growth, Capped Hock, Wind Puff, Strained Tendon or Sweeny can compete with his physically perfect mates, either in achievements or endurance. Splendid looking horses—otherwise sound—often fail because of some blemish that could be quickly removed with

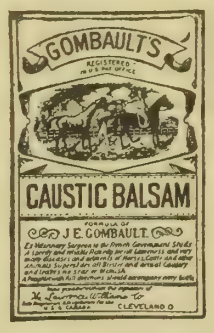
Gombault's Caustic Balsam

Whether you are the owner of race-horses or work-horses, you can prolong their usefulness by the use of this time-tested remedy.

Every stable should have GOMBAULT'S CAUSTIC BALSAM always on hand.

Supersedes all Cautery or Firing. Never leaves a scar or discoloration of hair.

A Reliable Liniment for External Human Use



Has no equal as a liniment and counter-irritant for HUMAN USE. For treatment of Inflamatory and Muscular Rheumatism, Sore Throat and Chest Colds, Growths and Stiff Joints.

GOMBAULT'S CAUSTIC BALSAM if applied immediately to Burns, Bruises or Cuts, is a perfect antiseptic—soothing and healing. An absolutely safe external remedy for human and veterinary uses. It's fame is Nation-Wide.

Every bottle of Caustic Balsam will give satisfaction.

Sold by druggists, or sent by parcel post on receipt of price, $1.50 per bottle. Send for descriptive circulars.

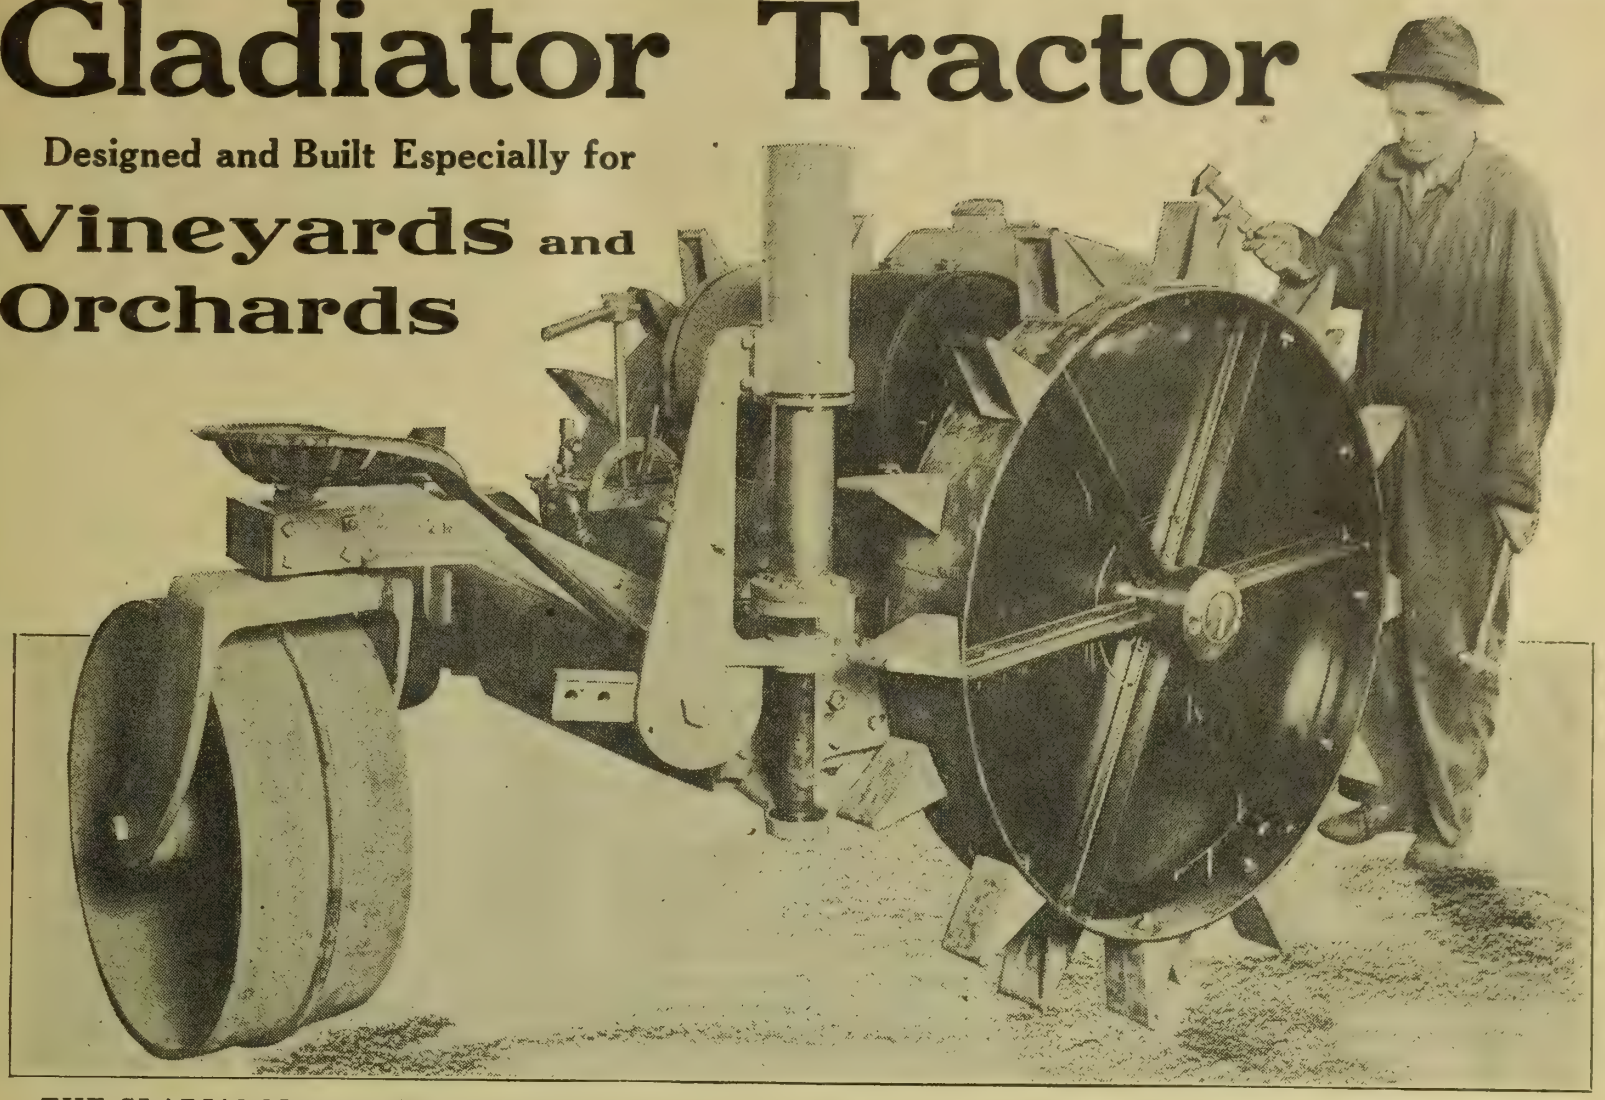
Gladiator Tractor

Designed and Built Especially for

Vineyards and Orchards



THE GLADIATOR TRACTOR with hydraulic lift. It tu rns inside a five-foot radius plow and tractor, making it especially desirable for vineyard and orchard work.

Are you interested in a DEPENDABLE ECONOMICAL TRACTOR that will turn squarely around *inside* a five-foot radius, Plow and Tractor—a tractor that with implement, can be operated in every inch of a vineyard by one man, without waste space at ends and equipped with right and left changeable hydraulic plow lift?

THE GLADIATOR TRACTOR is built to meet the demands of the vineyardists and orchardists of California. Its assembly is an advanced step in tractor design, especially overcoming objectionable long hitches and wide turning radius of four wheel types.

THE HITCH is close up either right or left hand—plows are connected to the *Gladiator hydraulic plow lift*. By turning a cock with tractor stopped or in motion, the pressure from an oil tank lifts or lowers the implement to position desired.

For years Californians have been looking for a tractor like the GLADIATOR. It is built for California conditions, with high clearance—especially constructed drive wheels attached in the center of the frame thereby eliminating danger of rearing up.

There is no other tractor in which the transmission, engine and other essentials are so easily accessible.

The hydraulic power lift feature of THE GLADIATOR TRACTOR alone is the most advanced step in tractor design this year. ONE MAN HANDLES THE TRACTOR and ANY IMPLEMENT from the seat of the tractor and he does it without having to swing wide at the ends of rows. The entire job is built with compactness, for short turns and adjustable for different width rows.

THE GLADIATOR TRACTOR IS EQUIPPED WITH
Hydraulic lift adjustable left or right side
4 x 5½-inch engine
Governor built in
Power Pulley if desired
S. R. B. Roller Bearings throughout

Exhaust from engine is discharged on inside of steel guards over the bull gears thereby making it impossible for dust or grit to get into gears. This also eliminates noise from exhaust.

Dealers will find THE GLADIATOR an easy tractor to sell because it meets conditions not satisfactorily met by any other power farming equipment.

THE GLADIATOR TRACTOR HAS A 60 INCH WHEEL BASE AND THE DISTANCE FROM CENTER OF WHEEL TO CENTER OF PLOW BOTTOMS IS 60 INCHES.

THE GLADIATOR is extremely easy to handle because the turning is a FORCE DRIVEN OPERATION and there is no chance for the tractor to slide around the corners. Wheel runs 18 inches from the furrow at all times.

Side draft has been eliminated through patented mechanical perfection.

Vineyardists and orchardists interested in a one man tractor are also i n v i t e d to call and see THE GLADIATOR in the Power Farming exhibit at the State Fair, Sacramento, September 3rd to 11th and at the San Fernando Fair, September 19th to 24th.

The Tractor

By J. Murray Hunt

THE world needs food, and it is fortunate that we have learned how few people may provide food for many. The supplying of food is facilitated by the more efficient farming made possible by the use of the tractor—better and deeper plowing, better soil preparation, better planting—larger crops result. The farmer has a greater buying power and more time for leisure. Many a farmer's wife, too, has blessed the tractor. It has considerably lightened her burden, because motorized farms can be operated by fewer men.

The tractor knows no season. The farmer who reaps the greatest profits from its use is the one who finds something for it to do most of the year round. The more a tractor is used, the greater is the profit on the investment. Also, the more operations which are performed in going over the field once, the greater is the saving to the tractor owner. Here is where it pays most to own a tractor with big power.

Besides performing the usual plowing, breaking and pulverizing of the ground in one operation, and harrowing and seeding, the tractor may be used as a veritable power plant for all farm work.

The use of a tractor results in a deeper and richer seed bed; this in turn yields bigger crops, per acre. Tractors with subsoilers are able to break up the toughest kind of hardpan. Through the use of the heavier and more powerful tractors it is possible to break the earth to a depth of 24 inches and more. Subsoiling is practiced to a large extent in California, and is growing in favor, because of its profitable advantages. The moisture that can be conserved by subsoiling is a tremendous asset. When the ground is broken up to a good depth, the rainfall penetrates instead of running off as waste. Greater crops are sure to result. Subsoiling in orchards is now being recognized as a money making operation. Almost every farm, in fact, can benefit through subsoiling because there is no doubt that the deeper the ground is prepared for plant life the bigger will be the returns.

Tractors in combination with land levelers are making thousands of acres of waste land profitable. The expense of putting these rough acres into profitable shape for crops is low with tractor equipment, because big quantities of dirt can be handled in such a short time. There are numerous cases in California where tractors and land levelers have prepared land for crop production on an extremely large scale. For instance, 4,000 acres near Merced belonging to one producer are being leveled for orchard. The work is being done by tractors and levelers of big capacity. The low costs per acre make this leveling a paying operation.

Still another factor that increases the popularity of the tractor and that helps to make it a paying investment to its owner is its ability to go out and bring in good profits in contract work. Many tractor farmers do this. One told me, just a few days ago, that his tractor had cleared over $5,000 for him last year in contract work, besides doing all the work on his own 600 acres.

The Tractor's Development

Some things that seem quite visionary on first appearance finally turn out eminently practical. Thousands of people said the tractor would never get anywhere, but it has. Others condemned the automobile and the motor truck, but look at the thousands of them in service now.

Early tractors were of crude construction. However, the mixture of steel and inventive brains has finally prevailed in its competition with mere animal flesh. The tractor designers are throwing away freak models and getting right down to tested mechanical details, and as a consequence the tractor is relentlessly forcing its way into general use on most farms of any size.

The tractor saves time and economizes on man power. It also has the ability to do thorough work in hot weather. It can work right along, 24 hours a day, too.

Tractors would not be continually increasing in number on our farms if they were not profitable to their owners. When a farmer buys a tractor or any other farm equipment he puts it to work to increase his profits. This comes not only through a greater crop yield but reduced costs as well. The manufacturer does the same thing when he buys a new machine for his factory. He installs it to enlarge production or to bring down costs, or both.

Some Tractor Figures

The fact that tractors are being manufactured and sold in increasing numbers from year to year is evidence of the farmer's acceptance of the advantages that the tractor gives him. In 1909 there were only 2,300 tractors built in the United States. By 1915 the number had grown to nearly 22,000, about as many as are used in California alone today. Now the yearly production runs well over 200,000.

The story of the development of the tractor's use in recent years reads like a romance. The following figures give an idea how the industry has grown. In 1909 the estimated production was 2,300; 1910, 4,500; 1911, 7,400; 1912, 11,400; 1913, 7,400; 1914, 10,400; 1915, 21,900; 1916, 28,000; 1917 (U. S. figures), 62,742; 1918, 135,000; 1919, 175,000; 1920, 203,000.

Just look back on the automobile industry. In the ten years period from 1908 to 1917, inclusive, the automobile industry increased its annual production from 85,000 to 1,600,000. In the same period, motor truck production increased over 4,000 per cent. It looks like the tractor industry, and the farmer too, are due for greater prosperity in the years ahead.

Tractor Research Work

Research work, in recent years, carried on by the commercial department of the Curtis Publishing Company, shows the unusual development of power on the farm. Their findings are of interest, not only in that they show the farmer's foremost place in the world's industry, but also how rapid has been his adoption of the most improved methods of producing crops. More than any other one factor in the advance of agricultural methods has been the constantly increasing importance of the tractor. On this point the report says in part:

"The tractor is of fundamental importance in the motorizing of the farm. Plowing requires more power than any other one job on the average farm. On a farm for which the tractor is adapted the plowing can be done better with a tractor and in much shorter time. The man who plows with horses starts out doing a good piece of work in the morning. As the day wears on he gradually lifts the plow to save the horses, and by afternoon is doing less efficient work. But he who plows with a tractor can plow at exactly the depth suited to the soil throughout the entire day, and all night too, without getting tired. Further, with the tractor he can plow in a single day as much as he could in a week with horses. He can therefore plow his ground quickly, and when it is in the best condition for plowing.

Mr. Howard Looks Ahead

James R. Howard, president of the American Farm Bureau Federation, has been a farmer all his life. He has seen the introduction of the tractor and other power farming machinery, and has formed his mature judgment of its economy through personal use and observation. He says "The demand for more food will continue more insistent with the growing population of this country, and this means an increasing use of the tractor and other power machinery, in more intensive farming methods."

The Tractor at the State Fair

At the coming state fair the farm power exhibit will be a big one. The present plans provide for a very extensive show of implements and accessories as well as tractors. Pacific Coast manufacturers and distributors

of Eastern machines have taken liberal space, so the California farmer has a genuine treat coming at the state fair this year. Several new designs and makes of tractors will be shown for the first time. This will be a magnificent opportunity for studying the latest developments in farm machinery, and the farmers who avail themselves of this opportunity are going to be amply repaid for their time.

In conjunction with the exhibits of tractors and implements Professor Fletcher of the agricultural department of the University of California is going to conduct his popular "Cafeteria Style Tractor School," where a present or future tractor owner may learn what he wants to know about tractor operation. Daily instructive lectures will be given at the various "Cafeteria Counters," on lubrication, materials, carburetors, magnetos and other subjects directly connected with successful tractor operation. These lectures are free and also informal. A farmer may ask any questions that arise in his mind.

The right sort of a fair is virtually an inventory of the year's progress. Its real purpose is to provide ideas by giving people a chance to see what others are accomplishing. The state fair at Sacramento this year is going to be an important event, as far as tractors and implements are concerned.

A NEW WEED

Guara sinuata is the name of a new weed appearing in many places in the south end of the state, from stations quite removed from each other. It has been sent to the Cultivator from San Fernando Valley and Ventura County and reported from Los Angeles and Pasadena. A study of it, the range and seriousness of infestation, soils and locations preferred is being made and, together with a detailed description of the plant, will be published at an early date. From dried specimens received it is a vigorous annual inhabiting dry hot soils, grows three or more feet high, branches freely, has small notched undulating leaves, magenta flowers of four finely cut petals and a four-sided angular seed pod a half inch long and less than half as thick. It flowers and seeds profusely and should be destroyed as soon as found. At this season of the year, when seeding, plants should be burned.

WINTER COVER CROPS

Orchardists are now ordering seeds for cover crops, for the time is approaching when they should be sown. A recent visit to the San Dimas district of Los Angeles County disclosed the fact that about 60 per cent of the orchards will be so planted. Years ago common vetch was bought by the local citrus association by the carload, for its members. Since the almost universal use of this crop the orchardists have experimented with everything that has been offered so that now they are much divided in opinion and crops used.

Some melilotus still is sown, but J. B. Vaile and some others will use nothing but purple vetch, of which the supply is good and the price much less than in 1920, or about 18 cents a pound. Old orchards will receive 20 to 25 pounds per acre, but where trees are smaller 30 pounds will be used. A few will mix rye or Canadian field peas with the vetch. Too many of the older orchard trees were planted 20 feet apart and little space now remains for the planting of cover crops.

The method of preparation and sowing has not changed from that used in the past. After a thorough irrigation, and as soon as the soil can be worked without danger of caking it, it is cultivated. The seed is then sown broadcast and the permanent irrigation furrows made which are to remain until the cover crop is plowed under, generally in late February or March. A few still sow first, furrow out and then irrigate, but this is not considered good practice, for if a hot spell comes the soil will bake before the cover crop has developed enough to shade the soil, perhaps before it is up. So far as the limited supply of seed will allow a few orchardists will sow an experimental plat of Hubam, the new annual white sweet clover.

Pacific Irrigation Valves

THE method of construction used in Pacific Irrigation Valves effects a saving of at least 50 per cent of the cost of the all-brass valves commonly used for irrigation purposes, without in any way reducing efficiency of operation.

The body of the valve is of cast iron, and a rolled brass stem is used to give strength and protection for this vital part of the valve and insure against easy breakage. Renewable leather seats assure a tight fitting valve at all times and adjustment for the slight wear that may result from continued use is a very simple matter. These valves are arranged so that a canvas hose can be easily connected thereto.

All valves are threaded for O. D. Casing and Standard Pipe as per sizes listed.

Size, inches	1½	2	2¼	2½	3	3¼	3½	4

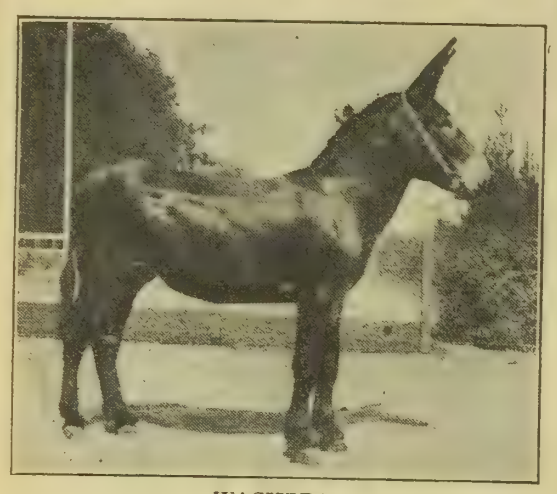
FOR AGRICULTURAL UPLIFT
(Continued from Page 200.)

been assured in every department of this fair, greater premiums have been provided; in fact, this will be the most expensive fair ever presented by the Ventura association. The livestock, agricultural and horticultural, poultry and pet stock, oils and minerals, commercial and women's departments will be more complete than ever before. Ventura Fair officials may be said to be optimistic to the greatest degree.

Santa Anita Rancho

Pure Bred Registered Percheron, Arabian, Thoroughbred Horses
Holstein-Friesian Cattle Southdown Sheep Big Type Poland China Swine

Mammoth Jacks and Jennets



WASHEBA

Washeba, a four year old prize winning son of the great prize winner King Beersheba. Color: Black with white points, 60½ inches high, girth 69 inches, bone 9 inches. Weight 1,115 pohnds. Of a splendid disposition, broke to service, and a sure foal-getter, as there are a number of very excellent mule colts sired by Washeba. The Rancho offers for sale at this time six excellent typey Mammoth Jacks including Washeba, and several Jennets bred to King Beersheba, and some due to foal in September. Prices are reasonable, and in keeping with the quality of the animals offered.

ARSAR

Head of the Santa Anita Rancho Percheron stud. Grand champion Los Angeles and Riverside 1920. Sired by the great prize winning horse, Imp. Jusque, and out of the greatest of all American bred Percheron mares, Oaklawn Queen, he comes honestly by his great qualities. The Rancho has for sale three four-year-old, two two-year-old and three yearling stallions. All are of exceptional size and quality, and were bred and developed on the Rancho. All stock guaranteed.

All well mannered and broken to service in the breeding yard

E. R. ELKINS, Director of Fair

St. Helena Vintage Festival, St. Helena, September 3-5

The idea of the St. Helena Vintage Festival is to show and display the resources of this community to the outside public. Our resources consist mostly of vineyard, orchard and farm products, and these products are elaborately displayed in exhibits.

In conjunction with the displaying of our products, we have a carnival, in which there is dancing, concerts, a vintage show, continuous street attractions and a big floral and industrial parade.

The original intent of the festival was to foster the grape and wine industry, but since prohibition has come upon us, we are endeavoring to show our other products, among which is still the grape.

We hope by these annual festivals to be able to induce homeseekers and prospective farm owners to settle in our midst.

Tulare County Livestock and Agricultural Show, Tulare, September 13-17

The Tulare County Livestock and Agricultural Show, which opens this year at Tulare on September 13, is in its third year, having been originally started principally to give the pure bred livestock men of the county an opportunity to further the industry in this district. The notable showing they made, which attracted the attention of the state, and the undoubted pleasure with which the public attended the fair as a whole led to the repetition of the fair in 1920 on double the scale, with a success proportionately greater.

The event of 1921, which has the official recognition of the Western Fair Association, will exceed anything previously attempted in this line in the county. Exhibit space in all departments has been greatly increased, and this capacity will be taxed, it now appears. The automobile section will be made an unusual feature, and the implement and commercial displays are being booked on a scale which indicates that industry is expecting a big business revival. The community exhibits will exceed last year's unusual and elaborate section.

The five days of free entertainment will include a rodeo for the San Joaquin Valley championship to last two days, two nights of fireworks, military maneuvers and sham battle, boxing, vaudeville, moving pictures and other attractions in addition to the customary band concerts, dancing, "free acts," and so on.

The people have demonstrated that nothing suits their community instincts better than such annual events which go back in our racial history for thousands of years. The fair stands for greater community cooperation and good will and has become absolutely indispensable and invaluable in the county life.

Downey Community Fair, Downey, August 25-27

The Downey Community Fair was organized for the purpose of getting acquainted with each other; also to show the population living around and near by Downey that trading at home is a good thing both for the seller and the buyer. We have succeeded well in both instances. Of course, we never lose sight of the main object of all fairs to produce better fruit and better agricultural products by showing neighbors and the world what each farmer can do if he tries hard enough.

San Diego County Fair, San Diego, September 21-24

First of all let it be understood that the San Diego County fair is a farm bureau fair. Generally speaking we believe that what is best and most progressive in this county, so far as farming interests are concerned, is typified in our farm bureau movement. The very fact that we have a strong farm bureau organization points not only to progress but back of all that to a realization of individual and community needs that in itself is the most hopeful indication of better days ahead for this great industry. So then we strive, for one thing, to prove our progress by the increased excellence of our exhibits.

Our farm centers do not put on exhibits primarily for the sake of the prizes offered or because of a feeling.

Household Department

THE DREAM-TOWN SHOW

There is an island in Slumber Sea
Where the drollest things are done,
And we will sail there if the winds are fair
Just after the set of the sun.
'Tis the loveliest place in the whole wide world,
Or anyway, so it seems,
And the folks there play at the end of each day
In a curious show called Dreams.

We sail right into the evening skies,
And the very first thing we know,
We are there at the port and ready for sport
Where the dream folks give their show.
And what do you think they did last night
When I crossed their harbor bars?
They hoisted a plank on a great cloud bank
And teetered among the stars.

And they sat on the moon and swung their feet
Like pendulums to and fro.
Down Slumber Sea is the sail for me,
And I wish you were ready to go.
For the dream folks there on this curious isle
Begin their performance at eight.
There are no encores, and they close their doors,
On every one who is late.

The sun is sinking behind the hills,
The seven o'clock bells chime.
I know by the chart that we ought to start
If we would be there in time.
O fair is the trip down Slumber Sea,
Set sail and away we go;
The anchor is drawn, we are off and gone
To the wonderful Dream-town show.
—Ella Wheeler Wilcox.

SNAILS OR CINNAMON ROLLS

Here are some of the many recipes contributed in answer to request of Gilroy subscriber. We wish we might give them all, but lack of space forbids:

Mix 1 pound flour, 2 beaten eggs, 1 cake compressed yeast (dissolved in a little warm water), 1 teaspoon salt with enough scalded and cooled milk for medium firm dough. Let rise. Work in 4 ounces sugar and 4 ounces shortening. Let rise again and roll out ¼ inch thick. Brush with melted butter, sprinkle with sugar, cinnamon and currants. Roll up and cut in slices ¼ inch thick. Lay in greased pan and bake when doubled in size.

Mrs. J. Rembert, Lindsay

Scald 1 cup sweet milk, let cool, add 1 cup mashed potatoes run through a ricer or sieve, 1 tablespoon butter, 2 eggs, ½ cake compressed yeast dissolved in a little lukewarm water, 2 tablespoons sugar. Stir all together with 1 cup flour. Let rise, mix with enough flour to make a stiff dough, roll out and sprinkle with brown sugar, cinnamon and currants or seedless raisins. Roll and slice as you would jelly roll and place in greased pan to rise. When light brush with a little milk and bake. The foundation of this is also fine for buns or Parker House rolls.

Mrs. A. Semmler, Sebastopol

1 cup scalded milk, 1 compressed yeast cake dissolved in ¼ cup lukewarm water, 1½ cups flour, ¼ cup melted butter, ¼ cup sugar, 1 egg well beaten, 1 teaspoon almond flavoring, ½ teaspoon salt, 3 (about) cups flour. Cool milk to lukewarm, then add dissolved yeast and 1½ cups flour. Beat until smooth and put in warm place until light; will take about 1 hour. Then add other ingredients, turn on board and knead until smooth and elastic and does not stick to hands or board. Place in well greased bowl, brushing top over with melted shortening. Allow to rise to 2½ times original size; will take 2 hours more. When light roll into sheet ½ inch thick, brush over with melted butter, sprinkle with sugar and cinnamon, and, if desired, seedless raisins. Roll as for jelly roll and with sharp knife cut slices about 1½ inches thick. Place slices upright in well greased pan and stand in warm place to rise till very light. Can be varied by sprinkling brown sugar in pan after greasing and placing slices on sugar. When baked turn upside down, the brown sugar forming a candied top. Care should be taken not to use too hot an oven for these rolls.

"Aida"

2 cups flour, 1 teaspoon sugar, ½ teaspoon salt, 2 tablespoons lard, 2 teaspoons baking powder, milk enough to make a soft dough. Roll out ½ inch thick and spread with brown sugar, nuts, cinnamon. Roll up again and cut. Put a thick coating of butter, brown sugar, cinnamon over it, and bake.

To make with yeast, use any sweet rusk recipe, only rolling out, covering with the sugar and paste, before setting to rise the last time.

COOKIES FOR EVERYBODY

(Concluded.)

Mrs. G. C., Bishop

Plain Cookies.—One cup sugar, 1 cup sweet cream, butter size of an egg, 2 eggs, 1 teaspoon soda, 1 teaspoon cream of tartar, flour to roll. Flavor with 1 tablespoon lemon juice and grated rind of 1 lemon, or nutmeg and vanilla.

Sour Cream Cookies.—One cup butter, 2 cups sugar, 1 cup sour cream, 2 or 3 eggs, ½ teaspoon soda, flavor, flour to handle easily.

(Will "Mrs. G. C., Bishop" send address for subscription credit?—Edit.)

Mrs. Oliver Arbogast, Los Angeles

One and one-half cups brown, light (Extra C) sugar, ½ cup shortening (use ham and bacon fryings), 1 egg, 5 tablespoons sweet milk, 2 heaping teaspoons baking powder, 2 rounding teaspoons ginger (ground). Enough flour to roll stiff, and they will be nice and crisp.

Mrs. Harold C. Rudolph, Esparto

I am sending recipe for plain rich cookies, one we have used for years. One cup butter (scant), 1 cup sugar, 2 eggs, 1 tablespoon water, 1 teaspoon vanilla, 1 teaspoon baking powder. Flour to make a dough and roll out thin. Cream butter and sugar, add well beaten eggs, water and extract. Beat thoroughly. Sift baking powder with one cup flour into other ingredients, beat until light. Add flour to make soft dough, about 1½ cups. Turn onto floured board, knead lightly, roll thin, cut out with cutter and bake in a quick oven.

Mrs. R. P. Dickson, Porterville

Rich Sugar Cookies.—One cup sugar ¾ cup butter, 3 eggs, small teaspoon soda, sprinkling of nutmeg. Flour to roll thin, this having no wetting except eggs and no baking powder can be given invalids when other cake stuff cannot be given.

Cultivator Subscriber

One cup sugar, 1 cup shortening, 1 cup molasses, 2 eggs, 1 teaspoon ginger, 1 tablespoon soda, 1 tablespoon vinegar, ¼ teaspoon salt, flour enough for stiff dough. Mix in order given. Dissolve tablespoon soda in warm water, add vinegar, let foam then add to dough, roll and bake. These are just as good after a month as when freshly baked.

Kay Esspe, Bonsall

Take about a pint of any good bread dough when it is ready to work into loaves. Add 1 egg, 1 tablespoon sugar and 2 tablespoons butter substitute. Work in thoroughly. Roll to ¼ inch or less. Spread with softened butter, sprinkle with sugar and cinnamon, roll up and cut ½ inch slices. Put in buttered pan and let get light and bake as any bread.

Mary L. Hootman, Puente

Three eggs, 1 cup sugar; a little over a half cup butter, 2 tablespoons water, 2 teaspoons baking powder, flour sufficient to roll. This makes a large crock full. The best I ever ate. Sift baking powder with flour, make a hollow place in the flour in which to hold the other ingredients. Work them into the flour with the hand. Do not beat the eggs before putting them in. Bake in hot oven.

Mrs. Lilly M. Robertson, Kerman

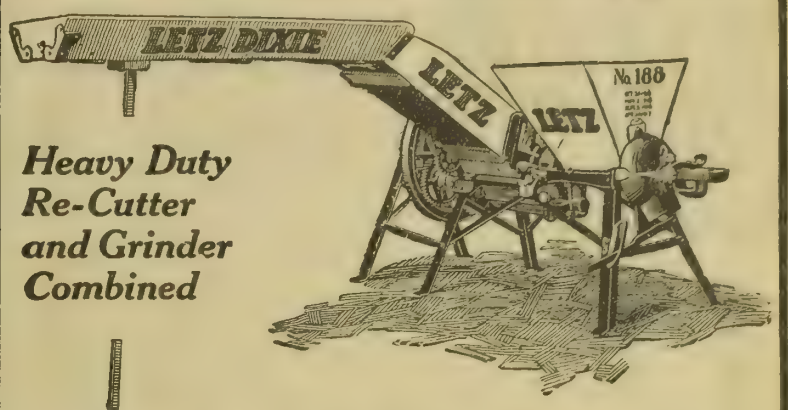
Soft Cookies. — One cup butter or shortening, 1½ cups sugar, 3 tablespoons milk, 1 teaspoon baking powder, just enough flour to roll out to a soft dough. Sprinkle with sugar before rolling, cut in rounds, bake in quick oven.

Mrs. N. R. Johnson, Redlands

Sugar Cookies. — One and one-half sups sugar, ½ cup shortening, 4 rounding cups flour, 1 cup sour cream, 3 eggs beaten separately, 1 teaspoon soda in 2 tablespoons hot water, 1 teaspoon nutmeg, ½ teaspoon salt. Sprinkle sugar on top. If sour milk is used, use more shortening.

Mrs. Chas. E. Dack, Fresno

Plain Sugar Cookies.—One-half cup butter, 1½ cups sugar, 1 egg, 4 tablespoons milk, ½ teaspoon soda, ½ teaspoon cream of tartar, 4 cups flour. Cream butter with 1 cup sugar, add well beaten egg, heat milk, dissolve



Heavy Duty Re-Cutter and Grinder Combined

See Our Free Demonstration of This Famous Feed Grinder

It's the mill with the grinding plates that cut, grind and pulverize all in one operation—the grinding plates whose thousands of keen-cutting, scissor-like edges beat all other processes in fine cutting, light running, durability, and capacity. It's the LETZ DIXIE.

Grinds peanut hay, velvet beans, snapped corn, cow pea hay, alfalfa, kaffir corn, corn fodder, etc. to any fineness. Handles everything wet, dry or oily without clogging.

Easy to operate—saves fuel—cuts feed costs one-half. Hundreds of thousands of Letz Mills now giving satisfactory service prove their superiority.

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

soda in it, and add slowly, sift cream of tartar with three cups flour and add one cup at a time, sprinkle the board with the remaining cup of flour. Roll out dough ¼ inch thick, cut with round cutter, sprinkle with ½ cup sugar and bake in moderate oven 10 to 12 minutes or until done.

Molly Mertz, Fresno

Easily Made Cookies.—One and one-half cups sugar, 1½ cups butter milk, 2½ level teaspoons soda, 2 pinches salt (if lard is used), ¾ cup lard or butter, 4 cups flour, 2 level teaspoons baking powder. Sift flour, baking powder three times. Work in lard as for biscuit, add sugar then the butter milk. A little more flour may be required to make dough that will roll. These cookies may be flavored with spices or extracts. Five dozen cookies may be made from this recipe. Bake in oven 5 to 10 minutes.

One cup butter, 3 cups sugar, 3 eggs 1 cup milk, 1 small teaspoon soda, 1 teaspoon baking powder. Flour enough to roll. Cream butter and sugar together, add the well beaten eggs, then stir in the milk with the soda dissolved in it. Use any flavoring desired. Ground nuts or caraway seeds will make a variety and are good. This will make about 120 medium sized cookies.

Mrs. H. Warren Shepard, National City

Orange Jumbles.—One pound granulated sugar, 1 pound butter (not a buter substitute), 6 eggs, juice of 3 large oranges. A little grated rind may be added. Flour sufficient to make as soft a dough as can be thinly rolled. Cut in any desired shape and bake in quick oven. We think these excellent.

HINTS FROM HOUSEKEEPERS

Salads and Sandwiches

In response to request of Lola McKenzie, Douglas City, in your paper of August 6, I submit a few of my salads and sandwich fillings:

Salads:

With potato salad for foundation add: (a) finely shredded lettuce, (b) finely cut boiled, fried or roasted meat of any kind, (c) any leftover cold fish, (d) chopped or sliced boiled eggs, (e) combination of any of these additions.

Macaroni in very short lengths, cooked in well salted water used in place of potato for foundation of any as above.

Tomato, young onion, cucumber, shredded lettuce with mayonnaise. Add any left over string beans, peas or beets.

Nests of finely shredded lettuce containing hard boiled eggs quartered lengthwise or little balls of cottage cheese, served with mayonnaise.

Olives, shredded canned or fresh pimiento or sliced sweet pickle added to any fish or meat salad.

Diced celery (or seeded muscat grapes, canned or fresh), diced apples and walnut meats with sweetened mayonnaise. (Add shredded cocoanut to any fruit salad.)

Seeded muscat grapes, sliced peaches, apricots, pears, candied cherries, bananas, oranges, grape fruit, with sweetened mayonnaise, Canned fruits with juice well drained off is satisfactory.

Note.—Pour a little vinegar over diced potato before adding dressing to potato salad. Mayonnaise for fruit salads should be sweetened with powdered sugar. Beat powdered sugar into thick sour cream and add vinegar to taste for a new salad dressing for fruits or fresh vegetable salad, especially cucumber.

Sandwich Fillings:

Equal parts peanut butter and chopped raisins. (Raisins steamed or dropped in boiling water are improved.)

Equal parts peanut butter and chopped dates.

Equal parts peanut butter and mayonnaise dressing.

Note.—Any of these additions remove that tendency of peanut butter to cleave to the tongue or roof of mouth.

To deviled ham, potted meat or any of the canned sandwich spreads add: (a) chopped olives, (b) chopped pimientos, canned or fresh, (c) chopped sweet pickles. Grate cheese and mix with chopped pimientos.

Spread lettuce leaves with mayonnaise or boiled dressing, fold over or lay another leaf on top so dressing does not come in contact with the bread and butter. To vary this sprinkle over the dressing: (a) chopped walnuts, (b) chopped olives, with or without chopped pimientos, (c) chopped sweet pickles, (d) grated cheese, (e) yolk of hard boiled egg. Any of these are especially good with graham bread.

Lettuce and salad dressing filling with thinly sliced day old peanut butter bread.—Subscriber, Santa Maria.

Pickles That Will Keep

One gallon vinegar, one cup salt, one cup ground mustard, four cups brown sugar. Wash cucumbers and put in this mixture as they are gathered. Put in earthenware jars or glass, keeping the pickles under solution with plate and weight. Must have pure apple vinegar or they will not keep. If in jars cover well with cloth or paper.—Mrs. Adaline Brubaker, Lindsay.

Salads and Sandwiches

Replying to the subscriber's request for salads and sandwiches, I am sending recipes which I use and find very practical.

Club Sandwich.—Butter both slices of bread thinly and spread each with Durkee's salad dressing which can be purchased at any grocery. If you have them, lay a crisp lettuce leaf on each slice, but it is good without. Cover one slice with slices or small pieces of boiled or baked chicken, then a layer of bacon cut thin and fried crisp. Place another slice of bread on this and cut in triangles.

Nut Sandwich.—Butter two slices of bread generously. Sprinkle thickly with nut kernels chopped not too fine. Boston brown bread makes delicious sandwiches with nut filling. Butter the two slices of bread and spread generously with the following: 1 egg well beaten, 1 tablespoon butter melted, ½ teaspoon salt, 2/3 cup weak vinegar, 1 teaspoon sugar. Boil till it thickens. Let cool and add two-thirds cup sliced or coarsely chopped cheese. This will keep indefinitely.

Ham ground and mixed with any salad dressing is also a good sandwich filling.

Try adding sliced cucumbers with potato salad. It is a pleasant change. —Mrs. Henry Dirvin, Mountain View.

Cheese Cakes

This is my most valued recipe, having been a dainty in my mother's family for years: ½ cup butter, 6 egg yolks, 6 tablespoons sugar, 1 teaspoon cinnamon, 1 nutmeg grated, pinch of salt, soda size of pea. Beat all together and put in baked crusts, baked in muffin pans. Bake and cover with meringue made from the beaten whites of the eggs and one-half cup sugar beaten stiff. They are delicious. Enough for about 12.—Subscriber, Ramona.

HOUSEHOLD QUERIES

Vinegar "Bees"

We get so many good things from this paper I am always interested. Now may I ask a question? Does anyone know anything about "a something" to start vinegar with? It is sometimes called vinegar "bees." And where can we get it? I am told it comes in a dry form and when put in sweetened water will soon begin to work and in a few days will be good vinegar.—Subscriber, Riverside.

Some time ago vinegar or wine "bees" were widely advertised and recently have been heard of again since the home brewers have been active. The United States department of agriculture reports that the preparation is of no value. Our inquirer will find complete article on vinegar making in the Cultivator of August 20, page 187, written by a specialist in food preservation, W. V. Cruess of the state university. In this article he states that the starter to use is vinegar, one pint to one gallon of fermented liquid. Yeast is also used in the process.

Preserving and Drying Figs

On page 77 of the issue of July 23 I read an article on "Home Canning of Fruits" and in it the statement,

The Cultivator Patterns

3687. Girl's Apron.—Cut in 4 sizes: 4, 6, 8 and 10 years. An 8 year size will require 1⅝ yards of 27 inch material. Price 10 cents.

3686. Ladies' Dress.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 4⅞ yards of 42 inch material. For panel, collar and cuffs of contrasting material 1⅝ yards is required. Price 10 cents.

3702. Girl's Dress.—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size will require 3¼ yards of 40 inch material. Price 10 cents.

3691. Ladies' House Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 4⅞ yards of 36 inch material. The width at the foot is about 2 yards. If made of contrasting material, collar, belt, cuff and pocket facings require ⅝ yard. Price 10 cents.

3376. Girl's Dress.—Cut in 4 sizes: 2, 4, 6 and 8 years. A 4 year size will require 2⅝ yards of 36 inch material. Price 10 cents.

3685. Misses' Dress.—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 4⅞ yards of 38 inch material. The width of the skirt is 2¾ yards. Price 10 cents.

3434. Girl's Dress.—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size will require 3¼ yards of 36 inch material. Price 10 cents.

3692. Ladies' Apron.—Cut in 4 sizes: Small, Medium, Large and Extra Large. A Medium size requires 3¾ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK**. Therefore, we promise to deliver all patterns ordered within **TWO WEEKS**; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

"Figs are better preserved than canned." I would appreciate it very much if you could send me a recipe for preserving figs. Am very sorry a copy of your paper did not fall into my hands in time to have gotten this recipe. Am also very much interested in a good method of drying for home use.—Subscriber, Orange.

Methods of preserving figs are given by Mr. Cruess on page 830 of the Cultivator of June 25; directions for drying figs on page 780, issue of June 11; drying in syrup, page 189, issue of August 20. Copies are mailed to this inquirer. Just a hint to others interested—save your Cultivators!

Candying Figs—Other Fig Recipes

Would like very much to have recipe for candying figs, or any fig recipes.—Subscriber, Fairmead.

Directions for candying figs and other fruits were given on page 780 of the Cultivator of June 11, copy of which will be mailed inquirer. Other recipes for figs are:

Fig Marmalade.—Use only fully ripe figs. When they are considerably wilted they are cut. Cut in halves, remove pulp; mash and strain through coarse sieve. Put into a glazed dish and place the latter in boiling water. Boil constantly for one-half hour and then preserve in sealed glass jars, like canned fruit. This marmalade is very fine; can be eaten with meat or alone with cream. It is a fine relish if made from good, sweet figs.

Fig Jam.—Boil sweet dried figs with some syrup till all the juice is thick and syrupy, then run figs, syrup and all, through food chopper that will grind it into a paste. This paste is fine for use wherever a jam can be used, and can be made more easily than any jam or jelly.

Fig Paste.—Pick the figs fully ripe, split and remove pulp, mash and strain and let come to a boil, constantly stirring. To 10 pounds of fig pulp add 1 pound grated cocoanut and the juice of one lemon. After boiling a half hour spread on plates and dry in the sun. When fully dried keep in air tight place if possible. When ready to use soak in warm water overnight and boil in the same water.

Figs and Grapes.—White figs and Muscat grapes are sometimes preserved together, the second crop of figs coming in season to can with the grapes. Pick the figs when their skins begin to crack; peel, weigh and allow one-half pound of best granulated sugar to one pound of the fruit. Mix the fruit and sugar carefully (not breaking the figs), and let stand overnight. In the morning cook slowly on the back of stove, stirring carefully at intervals. In the morning also prepare your Muscat grapes by picking them from their stems, washing, weighing and allowing one-fourth pound of sugar to one pound of fruit (and as many grapes by weight as figs). Cook in another kettle, using only a very little water—just enough to keep them from burning. They will need cooking nearly an hour. When both fruits are done, mix carefully together, let come to a boil, and can.

TOILET NEEDS AND HELPS

To prevent wrinkles from coming long before they should, always use rainwater for washing the face, then be sure that you use a good and safe face powder and a good skin food. One of the safest skin foods is fresh goose grease, and next to it poultry fat of any sort as this is readily absorbed by the skin and it can be clarified and perfumed to suit one's taste. Hot milk is a safe and nourishing lotion for the skin to restore its plumpness. Lay linen wet in it on the cheeks after massage, not before. With care probably cheeks can be made firm and round by constant feeding of the pores and rubbing upward.

Cucumbers are a natural cosmetic. The juice of this vegetable freshens and clears the skin, but when desired for whitening, use the part lying near the skin. The juice of fresh cucumbers can be heated to the boiling point, then skimmed and bottled. A teaspoon of this juice should be applied to the face night and morning, letting it dry on.

When badly sunburned, do not wash the face soon after or in cold water. Wipe it gently with cold cream and dust lightly with corn starch. If you do wash it, use water as hot as can be borne, dip soft cloths in hot water and lay them over the face. This is an excellent way to treat pimples on the face, ivy poison or any skin eruption, only a little granulated boric acid should be dissolved in the water.

This saturated solution of boric acid is one of the best lotions for sore eyes. For boils and styes there is no safer and more effective remedy than this solution. It is much used to check perspiration by applying after the bath and allowing it to dry on, and for odorous feet wipe off with the solution and sprinkle powdered alum in the stocking. This solution is invaluable where there are infants and small children to prevent chafing, heat and hives. If you have a bunion that is very sore, apply iodine every night with a small brush or feather until all soreness is gone, then wash it every night in strong salt water and rub gently with the hands to increase circulation. For excessive perspiration of the feet, bathe them in very strong salt water every night. Equal parts of bay rum and glycerine will remove callous spots from the feet and will soften hard corns if used daily, but nothing will do much good unless all pressure is removed from the tender spots so far as it is possible.—A. M. H.

GIVE YOUR CHILDREN MILK

Many a farmer who understands the importance of bone building in the young farm animals forgets entirely that his children are subject to the same requirements. Every farmer knows that his calves are inferior if they do not receive sufficient milk. The same applies to children.

The extreme importance of milk in the diet of children lies in the fact that milk is one of our richest calcium giving foods, and calcium is an essential bone building mineral nutrient. The calcium requirement of the child exceeds that of the adult. Meat is very low in calcium, fruit and vegetables contain small amounts, a few of the green vegetables quite a large amount.

But the main source of calcium is milk. There is more calcium in a quart of milk than in a quart of lime water. A quart of milk a day for each growing child is a desirable allowance.—Colorado Agricultural College.

SPOON FLIVVER ANTHOLOGY

Here lie the remains
Of Chester Sapp;
He drove his car
With a girl on his lap.
—Washington (Pa.) Observer.

Poor Chester might still
Have been alive
Had he only taught
The girl to drive.
—LaMonte (Mo.) Record.

The moral learned
From this sad loss
Is—Drive a buggy
And a gentle hoss.

DISCOURAGING

Teacher (in cooking class)—"What are you crying about, Mary?"

Mary—"I've boiled (sniff) this can of tomatoes (sniff) for nearly two hours and the can (sniff) won't come off."

RICE A LA CLAUDE

Chop one onion very fine, put in saucepan with one teaspoon olive oil, one tablespoon melted butter; let onion boil until yellow and done, then add one cup washed California rice and four cups chicken broth, beef juice or any kind of stock; add salt and pepper to taste, bring to boil, cover the saucepan and put in oven for 25 minutes; before serving add one-half cup grated cheese.—Victor Hirtzlee, Maitre de Cuisine, Hotel St. Francis.

GENTLE REMINDER

"The storm burst upon us so suddenly we had no warning of its approach," related the tornado victim. "In an instant the house was demolished and scattered to the four winds. How I escaped being torn to pieces I do not know."

"Good Lord!" ejaculated little Mr. Meek. "That remnids me, I almost forgot to do an errand for my wife."

Matrimony sometimes means a month of honey and years of vinegar.

FOR AGRICULTURAL UPLIFT

(Continued from Page 208.)

of rivalry, but more than all because of this new spirit of progress each wishes to show what can be done with the materials at hand. We believe there is another development that makes these fairs worth while and that is the genuine friendliness and cooperation in each center that finds expression in community exhibits. Through the farm bureau the farmer is discovering how much better it is to pull with his neighbors than to pull alone, and how much more can be accomplished by team work for community and other betterments than by individual effort. There is also in our fair the element of honest pride in work well done and in its just reward, as well as pride in a county where such things can be accomplished. Local pride because of real achievement prompts each center to do its best.

These things, then, we want our visitors to see in our fair; not only fat stock, beautiful fruit, fine needlework and agricultural marvels, but real progress, friendly cooperation, mutual helpfulness and pride in our county and in our work.

Kings County Fair, Hanford, September 19-24

The closest and most helpful cooperation is being shown this year between the county farm bureau and the fair association in the development of plans for the 18th annual Kings County Fair, September 19-24. This, the oldest county fair in California, has always been essentially an educational exposition for the progressive farming and stock raising people of this district, and this year the showing of livestock, of agriculture and horticulture, of the interesting work in woman's realm, and in all other departments, promises to be bigger and better than for many years past.

Eight of the wideawake farm centers of the county farm bureau are entered in the competition for best community exhibits, and rivalry is the very keenest. A new class added this year offers prizes for stock and agricultural exhibits for the boys' and girls' clubs of the county, and the educational work on county fair exhibits will be started with the younger generation.

Through a cooperative effort by the three fairs of the central San Joaquin Valley district, Tulare, Fresno and Kings Counties, in sending out joint notices and premium books for the "Central California Fair Circuit" stockmen in all parts of the state are planning to show at all three fairs, which run for three consecutive weeks, and from entries already coming in for this fair the stock show this year is to crowd the housing facilities.

A complete revision of the premium list and the increase of premiums offered in every department has brought the total close up to $10,000.

San Joaquin County Fair, Stockton, September 12-17

To stimulate and encourage the production of greater variety, larger quantities, and a better quality of agricultural and horticultural products, and to promote the breeding of better poultry, hogs, horses, cattle, sheep and goats. Those are the aims, it can truthfully be said, that were uppermost in the minds of the few far-seeing men and women who got behind a project in 1919 to revive the San Joaquin County Fair Association. Probably the farm bureau of San Joaquin County should be given the credit for bringing to the attention of the people the importance of holding fairs of this kind. At least that organization took a very prominent part in creating an interest and in aiding the officials in carrying through the vast amount of work the first year. That organization still takes a leading part in the local fair.

The supervisors set aside $50,000 to build one of the series of buildings needed. This was agricultural hall, 90 by 300 feet. It is now nearing completion and will be thrown open before September 12, the opening date of the fair. The grandstand will also be remodeled and an additional 115 feet will be built on the east end. Underneath this new portion space is being arranged to house the exhibits of the women's home department of the farm bureau, Red Cross, childs' welfare and the educational department.

San Fernando Valley Fair, San Fernando, September 19-24

The San Fernando Valley Fair, which is the official Los Angeles County Fair, will open its gates, September 19-24, and promises the biggest event of its kind.

The ten ambitious valley towns, with M. H. Adamson of the Adohr Stock Farms acting as chairman of the livestock committee, have organized a livestock show that will be equal to the one held last year at Exposition Park, Los Angeles. Some 800 of the best cattle owned in Southern California will be exhibited. There will also be the official poultry show of the American Poultry Association for Southern California for 1921, under direction of E. J. Hammond.

Another leading feature will be a working tractor demonstration and a "still" exhibit of every variety of power farming machinery. This department, with Robt. M. O'Neil at its head, is awaking the old interest shown in the demonstrations at the La Brea fields.

Exhibits of agriculture, horticulture, industries, domestic science and art and a baby show will all have their places, and also, of course, there will be a Midway with its riot of fun.

A special attraction is the horse show staged by Hamilton Horse Bassett. As $1,000 will be awarded each night in prizes, this will be known as the $1,000 a Night Horse Show. There are already 220 applications for entry, many from Santa Barbara, San Francisco, and as far north as Oregon and Washington. The arena where this show will be held each evening will be 150 by 300 feet.

On Saturday afternoon in the arena there will be a special matinee for children, at which will be given away a $500 outfit of a pure bred Shetland pony, cart and harness. Every child entering the grounds during the week will be given a ticket on the pony outfit. Drawing will be held at 2 o'clock at the matinee.

Inyo County Fair, Bishop, October 4-5

We expect to exhibit at our fair the varied resources of our county and believe it will be instructive and educational, encouraging more and better production in all lines of agriculture, horticulture and stock raising, urging systematic sampling and grading with cooperative buying and selling by the producers. Further, we expect to show to the prospective buyer and homeseeker that it will be to his interest to consider Inyo County before investing. Inyo, the county that yet has land for sale with water sufficient to irrigate it and at a price that persons of limited means can reach, produces all kinds of grain, root crops of all characters, fruit of all varieties except citrus, livestock of all classes to perfection. Dairying perhaps is the leading line for persons with limited means.

And, too, we have mineral resources rare, abundant and valuable. The high Sierra, snow capped Mt. Whitney, the many beautiful mountain streams and lakes stocked with trout make a veritable tourist's resort. All these we expect to exhibit by specimens, photographs, demonstrations, illustrated lectures, and in various ways to advertise our county and benefit our people. In fact, we aim to have a real county fair, with variations.

Pacific International Exposition, Portland, Oregon, November 5-12

The Pacific International Livestock Exposition is scheduled to follow all other county, district and state fairs throughout the Pacific Coast and Intermountain country, and so that there will be ample time for its champions in the meat breeds to go on to Chicago to compete with champions from other sections at the International Livestock Show in December.

Of first importance is the educational value of the Pacific International. By bringing together the best pure bred livestock of a dozen Western states and from western Canada. this stimulates a healthy rivalry. Judging demonstrations and contests, lectures by experts, moving pictures covering all manner of agricultural and livestock topics in a constructive way, and many other features make stock show week at Portland an educational opportunity which attracts every year thousands of seasoned breeders, young men just beginning to build up pure bred herds, agricultural students and enthusiastic juvenile club workers from far and wide.

Two years ago, through the cooperation of public spirited business men and leading breeders of the Pacific Coast, an immense pavilion, costing $250,000 and erected on a $75,000 site 15 acres in area, was completed in

(Continued on Page 221.)

SIR AAGGIE MEAD

He may be justly rated as one of the best bred bulls of the breed today, and his pedigree contains the blood that through sheer merit in the production lists and in the show ring, has come to be the most highly regarded in California.

—Consider the following facts about this outstanding young sire:

HIS THREE NEAREST DAMS AVERAGE:

Butter	2 years	2,201.87 pounds
Milk	2 years	44,997.90 pounds
Butter	1 year	1,229.74 pounds
Milk	1 year	25,274.86 pounds

FIVE OF HIS SEVEN NEAREST DAMS AVERAGE:

Butter	2 years	2,112.30 pounds
Milk	2 years	44,278.90 pounds
Butter	1 year	1,177.11 pounds
Milk	1 year	24,854.10 pounds

—Six of his seven nearest dams have made world's records or have produced world's record daughters.

—He combines in close manner the blood of De Kol of Valley Mead, Aaggie Acme of Riverside, and Aralia De Kol, three great cows that rank among the breed's greatest foundation dams.

—He is a three-quarter brother to Sir Aaggie Mead De Kol that sold in the Philadelphia National Sale for $11,000.00.

—He himself sold at public auction for $9,250.00, the second highest price on record in California.

—He has already sired an outstanding lot of calves that have met with instant favor from all who have seen them.

—He is being mated with the select females in both our herds, including upwards of 30 daughters of King Korndyke Pontiac 20th, the $12,000.00 son of Miss Valley Mead De Kol Walker.

IF YOU ARE INTERESTED IN INTRODUCING THE HIGHEST DEGREE OF TYPE INTO YOUR HERD, BACKED BY SOME OF THE BREED'S GREATEST YEARLY RECORD PRODUCTION, KEEP IN TOUCH WITH US FOR A YOUNG SON OF THIS ROYAL YOUNG SIRE.

THINK!

We believe that nothing in California agriculture will pay bigger dividends than a little honest-to-goodness thinking on the subject of present conditions and future prospects in the business of breeding purebred cattle of all breeds.

California breeders are today conducting their business upon an unusually sound and excellent basis.

Some of the world's greatest foundation blood has been freely drawn upon for foundation material, and its development in the hands of California breeders has resulted in the highest awards in the world's greatest beef cattle show, and world's record production for both milk and butter in numerous dairy cattle classes.

There is well under way in California a demand for registered breeding cattle that will tax the capacity of our herds for many years to come, assuring a stable market at substantial prices, within the borders of this state alone.

We could write pages of sound, logical reasons why NOW is a time of real opportunity for the foundation of new breeding herds. You can buy real foundation cattle right here at home, cattle that are born to California conditions and do not need a year or two in which to become aclimated in order to go ahead.

You can't go back to a place you have never left, nor can you deflate anything that has never been inflated. Prices of registered cattle in California have never left normal, nor have they ever been inflated, so there is no opportunity to apply the neatly coined phrases "back to normalcy" or "deflated prices" to them.

We list briefly below a list of public sales of registered cattle for which we have already set dates for the fall season. We will gladly supply catalogs of any or all sales to interested parties who write for them.

Also please remember that we extend reasonable credit to responsible parties in most of the sales managed by us, and if interested in that respect you may make your application to us at any time.

California Breeders Sales and Pedigree Co., 211-212 Ochsner Bldg., Sacramento, Cal.

70 Registered Holsteins

Complete Dispersal of

S. O. Walker Herd

Visalia, Cal.

Tuesday, October 4

Including the famous bull KING OF THE BLACK AND WHITES and 35 of his daughters, mostly 2 year olds. A wonderfully well bred herd, in excellent condition.

Guaranteed breeders; no tuberculin test certificates.

45 Registered Holsteins

A choice draft from the herd owned by

Robt. T. Curtis & Son, Exeter, Cal.

The Sale Will Be Held at

Tulare Sale Pavilion, Tulare, Cal.

Wednesday, October 5

This sale includes the great 34 lb. 4 year old, Coloma Beauty Butter Maid, and her daughter and two other heifers sired by King Korndyke Pontiac 20th, the $12,000.00 son of Miss Valley Mead De Kol Walker. It is a splendidly bred offering throughout.

Guaranteed breeders; tuberculin tested and sold subject to retest.

55 Registered Holsteins

A complete dispersal of the choice herd owned by

Alex. Whaley, Tulare, Cal.

Tulare Sale Pavilion

Thursday, October 6

This sale includes the noted 30 lb. cow Melba Hengerveld, and 20 daughters of Sir Aaggie De Kol Acme 2nd, one of the most richly bred yearly record bulls of the breed. A herd of choice individuals and large producers.

Guaranteed breeders; tuberculin tested and sold subject to retest.

37 Registered Holsteins

A complete dispersal of the fine herd owned by

John Saxer

Modesto, Cal.

Wednesday, October 12

This is a herd of very high average type and substantial breeding, including three daughters of the great bull Sir Skylark Ormsby Hengerveld, a daughter of King Segis Pontiac, and a daughter and son of the sensational 3 year old Moorland Colantha Rose.

Guaranteed breeders; tuberculin tested and subject to retest.

Owned by Robt. N. Clapp
and Selling at
Rhoades & Rhoades Sale Pavilion
Hynes, Cal.
Friday, October 21

An offering of splendid type, rich in the blood of King Segis, including many high record females and several famous show ring winners.

Guaranteed breeders; tuberculin tested and subject to retest.

75 Registered Herefords

The second annual offering from

Nevada Hereford Ranch

Owned By

J. H. Cazier & Sons Co., Wells, Nev.

Will Sell at

State Fair Grounds, Sacramento, Cal.

Tuesday, November 1

A wonderful offering, consisting chiefly of daughters of Harris Standard 2nd bred to the $10,000.00 Beau Blanchard 76th, including also several top young bulls and practically the entire show herd of this year.

Guaranteed breeders; a Federal Accredited herd.

65 Registered Holsteins

One of the most richly bred offerings ever made from the famous herd owned by

A. W. Morris & Sons Corporation

Woodland, Cal.

Thursday, November 3

This is going to afford an extraordinary opportunity to buyers.

Guaranteed breeders; tuberculin tested and subject to retest.

75 Registered Holsteins

The first individual public sale from the big herd at

Palo Alto Stock Farm

Palo Alto, Cal.

Wednesday, November 9

Including many outstanding individuals, high record young females, and a wealth of rich breeding.

Guaranteed breeders; tuberculin tested and subject to retest.

MASTERPIECE
OF EDGEMOOR

The Greatest of All Guernsey Bulls

Sired by **Royal Rose King of Edgemoor** who was by **Imp. Itchen May King, grand** champion of the P. P. I. E. in 1915 and grand champion of the 1920 National Dairy show. **Imp. Itchen May King** also sired **Dauntless of Edgemoor,** grand champion of the 1919 National Dairy show and **Vedas May King** who won championship honors at Portland last year.

Royal Rose King of Edgemoor was out of **Belladia,** the highest record Guernsey in California, who made 934 lbs. of butter fat in 365 days in a certified milking barn.

Masterpiece of Edgemoor

is out of **Jesebel of Edgemoor** the highest record daughter of the great **Ne Plus Ultra.** She is the State Champion in her class and stands 4th in her class for the U. S. with 12,434.9 lbs. of milk and 748.3 lbs. of butter fat at 2½ years of age.

Edgemoor Farms

is offering for sale some young cows and heifers safe in calf to Masterpiece. The females are excellent individuals from A. R. dams and the offspring from this mating will be extremely valuable.

GETTING AHEAD BY GOING BACK —TO LIVESTOCK

(Continued from Page 199.)

lish pure bred breeding herds. The production of pure bred livestock for breeding purposes is a specialized business for which not every man is suited to make a success. Rather is he urging that more owners of California ranches break away from the old and discredited specialized crop system of farming and in its place make their plans to keep what dairy cattle, beef cattle, sheep or hogs their ranches can safely carry as adjuncts to their other farming operations.

In adopting any plan in which livestock is a part this fact should be kept in mind: The time has passed when any man can justify the handling of scrub livestock, and in this period of readjustment changing economic conditions make it imperative that only efficient livestock be used. Efficiency in livestock management comes through the use of well bred animals that are given proper care.

The term "well bred" may apply to grade animals or may be confined to simply include registered pure breds. Pure bred animals are almost invariably more efficient than grades and if possible an effort should be made to at least have part of the herd or flock made up of registered animals—but in any case no man should be content to own other than a pure bred sire.

If pure bred livestock is purchased for founding a herd or flock the purchase should be made because of the admitted greater efficiency—the real dollar and cents worth—over common stuff rather than with the idea of at once branching out as a "breeder."

There never was a more propitious time to make a start with livestock than will be presented this fall. Prices, on the average, for breeding material are near pre-war levels and feed prices are such that a satisfactory margin is assured. The above facts, taken together with a very real need in California for more and better livestock, combine to make the business very attractive. No fear need be held that the livestock business will be overdone.

Tht number of cattle for each 100 persons in the United States today is one-third less than in 1900, the sheep supply is reduced nearly two-thirds, while the number of hogs is fully 41 per cent smaller now than then, according to figures compiled from the federal census reports.

This "alarming shortage" in livestock is such as to furnish a meat supply only about half as great for each person in the country as formerly. It is said that "the decline during recent months in prices to producers is so utterly unjustified as to constitute the gravest economic crime ever perpetrated upon the farmers of America."

Other figures were given to show that 20 per cent fewer pounds of meat were exported during the present fiscal year than during the previous year, while imports totaled 175,000,000 pounds of fresh meats, or nearly four times as much as two or three years ago. More than half of these imports, it is said, were mutton and lamb from Australia, or imports 25 times greater than the exports of the United States.

Herbert Myrick, compiler of the reports, charged that the U. S. department of agriculture for years has overestimated the number of sheep and swine and that the department's estimate for January, 1920, was in error no less than 28 per cent, as he said that the census found only 34,900,000 sheep, compared to the govtrnment's estimate of 48,600,000.

"The census also reveals 14,000,000 fewer hogs than government estimates," he continued, "having found only 59,000,000 pigs on farms, or 19 per cent less than the department's estimate of 72,000,000. The steady decline in the number of cattle since the census was taken is emphasized by the decrease of nearly 18 per cent in the number slaughtered during the past 11½ months.

In California, according to the census report, less than ten per cent of the farms reported pure bred livestock. Only about four per cent reported owning pure bred swine totaling around five per cent of the total swine population. About one and one-quarter per cent of our farmers own pure bred beef cattle and that ownership represents but a trifle over one per cent of the total number of beef cattle. Fewer than three and one-half per cent of our farmers own pure bred dairy cattle and these pure breds represent about two and one-half per cent of our dairy cattle population.

From the above figures it would appear that so far as this state is concerned the "point of saturation" as regards our pure bred livestock population is rather far removed and need cause no great concern. In view of the acknowledged superiority of well bred livestock over the commoner sorts is not the above condition surprising in a state enjoying a reputation for progressiveness?

How about you, Mr. Cultivator Reader? Have you been following a safe farming practice so that at present you are meeting conditions successfully, or are you finding the going pretty hard? Why not take a little time off and check up your business and if it appears that you can fit livestock into your operations why not make a determined start this fall? Let your own experience and the experiences of the most successful farmers of the nation be your guides.

In this connection the state fair next week and the various district and county fairs will afford a splendid opportunity to study the different types of livestock and a few days spent at these shows may point the way for many California ranchers to get ahead by going back to livestock.

EDUCATIONAL EXHIBITS AT SOUTHERN CALIFORNIA FAIR

The United States department of agriculture will have some very interesting and informational exhibits of departmental work at the Southern California Fair at Riverside, October 11 to 16. The work of the forestry service, biological survey, animal industry, plant industry and public roads bureaus will be shown in demonstration exhibits which will in a large degree be a surprise and enlightenment to many of our people who have but a vague idea of how deeply and thoroughly the federal government is going into this work which so closely touches all the people.

The state agricultural department will also have a wonderful exhibit at Riverside of the work of the various branches of this very important department of state government. These displays will be attended by representatives of the various divisions of the department who will be at hand at all times to explain and instruct.

In placing these exhibits both the federal and state departments recognize the educational value of the agricultural fair. The exhibits are so completely demonstrational in their arrangement that they tell their own story. He who walks by and looks may read and remember. The farmer will meet face to face, as it were, the insect, the pestiferous rodent or the animal disease which has been giving him so much trouble, and this intimate acquaintance will help him in his battle.

STATE FAIR DAIRY PRODUCTS EXHIBIT

The attention of creameries, cheese factories and dairymen is called to the dairy products exhibits at the state fair which opens September 3, 1921. Last week's issue gave detailed information concerning the exhibit. Butter can be shipped in 20 pound cubes. A whole cheese should be sent, four pint bottles of milk and four half pint bottles of cream. Prizes are given on quality and appearance of package. Entry blanks and premium lists can be secured from State Agricultural Society, Sacramento.

This is an opportunity for the dairy interests of the state to show their products. Every prize winning exhibit will be labeled, giving the name and address of exhibitor.

The cow testing division of the Kern County farm bureau held election August 20.

Kern County hog auction sales will be held: Wasco, September 3; Bakersfield, 17; McFarland, 30.

A Toggenburg goat dairy has been located on Paoha in Mono Lake.

State Fair Livestock Entries

THE following list of entries in the livestock department of the forthcoming state fair is complete only to the time this issue went to press. Notwithstanding the splendid showing indicated it is known that the number of herds and flocks will be considerably increased before the show opens. We publish the list as a sort of curtain raiser for the main event that opens next Saturday at Sacramento.

PREVENT SPREAD OF INFECTIOUS DISEASES

Many serious and infectious diseases, among which are anthrax, glanders, hog cholera, blackleg and rabies, together with many forms of internal parasitism, frequently attack new hosts, because of ease with which the disease is disseminated from carcasses left exposed on the surface, where they may contaminate streams as well as the soil, or be eaten by dogs or coyotes.

Too much emphasis cannot be laid on the importance of the proper disposal of carcasses of animals and fowls dead from other causes than slaughter, says Wm. H. Feldman of the Colorado agricultural college.

It has been shown that birds may also be responsible for the transmission of disease from infected carcasses to healthy individuals. The repulsive odor alone should be sufficient to insure a disposal which meets the requirements of modern sanitation.

Among the methods most preferred, burning, of course, comes first in efficiency. If it is not practical to burn a carcass, deep burying is a satisfactory method of disposal. Burying, however, should be deep enough to insure against attacks from dogs.

In case of a very contagious disease, such as anthrax, quicklime should be sprinkled rather liberally over the carcass before covering with dirt to insure rapid decomposition.

The Holstein Calf Club of Stanislaus County made exhibits of animals at the Patterson fair held this week.

The Glenn County farm bureau held its annual meeting at Ord last Wednesday.

Visit the CALCO Building

See Calco Products at Reduced Prices

The California Corrugated Culvert Company will exhibit its products again this year in its own building at the State Fair. You will find the exhibit interesting, and we will tell you where to find different Calco Products in use on the Fair Grounds.

Prices have been reduced on all products in proportion to the lower prices now paid for the materials of which these products are made.

Visit us at the Fair. Let us show these products to you and explain the details.

Ten Years in California Agriculture

By Frank C. Jordan, Secretary of State

I HAVE just completed an interesting study of the federal census statistics and find some startling comparative figures revealed. No one who reads them can fail to absorb a feeling of optimism. I feel it, and I say without hesitation that California and her citizens should be proud of the advance we have made and the position we hold today. We have no need to cry hard times. We have a right to be supremely happy for we are enjoying the greatest prosperity our state has ever known. We are well on our way to continue this prosperity, and I look to see the next ten years show even more remarkable progress than has ever gone before.

Tremendous Values of Farms

Turning to the figures we notice, for instance, that with an approximate land area in the state of over 100,000,000 acres we have at present 29,000,000 acres in farms which number more than 117,000 and show an increase of 29,473 in the last ten years. The value of this farm property is placed at $3,431,021,861, an increase of $1,600,000,000, or 112 per cent, in ten years. With this increase of more than a billion and a half dollars in value of farm property, the mortgaged debt on farm property has only increased $160,000,000. Another interesting fact is that the average acreage per farm today is 249, while in 1910 it was 316, and in this connection it is also interesting to note the development of intensive farming, for while in 1910 there were but 22,000 farms under 20 acres in size, today there are over 34,000. We also note that while in 1910 there were only 56,000 farms entirely owned and unmortgaged, now the census figures show in excess of 75,000 farms so owned.

Improvement of Farms

Development is further shown in the fact that the improvements of the farms, which can undoubtedly be taken as an example of prosperous condition, are placed at over $200,000,000, showing an increase of 117 per cent in ten years. The average value per acre of all farm property ten years ago was $57 as against $116 today. The yearly expenditure for labor now shows $126,000,000 as against $50,000,000 for the same period ten years ago.

Gain in Value of Fruits

Just what this farm development has meant in actual gain is best told by the following comparative figures showing the amount and value of various products, figures being based on the census reports for 1910 and 1920 respectively:

We note first the most startling increase in the value of fruits and nuts, $270,000,000 as against $50,000,000 ten years ago, or an increase of 434 per cent. In spite of prohibition the grape crop has brought approximately $65,000,000, while that of ten years ago brought about $11,000,000. Semi-tropical fruits show an increase from 16 to 90 million dollars. Walnuts brought $15,000,000 against $2,000,000 ten years ago.

Livestock Gains

In 1910 livestock on the farms was valued at $127,000,000; in 1920, at $221,000,000, showing an increase of 73 per cent. The latest figures credit the farms with 402,407 horses, 63,419 mules, 2,008,037 head of cattle, 2,400,151 sheep and 909,272 hogs. Poultry numbers 10,811,153 as against 6,087,267 in 1910, and is valued at $15,293,570. Receipts from the sale of dairy products show an increase of 175 per cent, being $52,509,964 as against $19,083,297 ten years ago. Wool was valued at $6,695,461 in 1920 as against $2,423,964 in 1909. Egg production amounted to over 57,000,000 dozen, valued at more than $28,000,000.

Over Half Billion for Crops

The value of all crops raised shows an increase of 301 per cent, $587,600,591, as against $146,526,151. Cereals are valued at $108,000,000 as against $27,000,000, and other grains at $31,500,000 as against $6,500,000 ten years ago. Value of seeds jumped from $800,000 to over $6,000,000; hay from $42,000,000 to $96,000,000; vegetables from $12,000,000 to $47,000,000; miscellaneous crops from $6,000,000 to $26,000,000; orchard fruits from $18,358,897 to $91,687,814; nut crop from 23,000,000 pounds, valued at $3,000,000, to about 67,000,000 pounds valued at $19,000,000.

We find 1,000,000 acres planted to wheat as against 487,000, and 116,000 acres in corn as against 51,000 acres at the former report.

There you have some of the more outstanding figures. Who can read them without being impressed? To me they point out a splendid progress in the agricultural development of California. They breathe optimism. They show a healthy condition that cannot be torn down by gloomy forebodings. They are the forerunner of still greater things to come. They give the lie to stagnation and depression. They stand as a beacon light and lead us to look confidently for a continuation of that spirit and pride which has made our state of California the greatest state of the Union in the past and which will continue to make it the greatest state of the Union in the future.

Diamond Bar Ranch, whose herd of Duroc-Jerseys has been an outstanding feature in red hog shows for the last two years, has advertised its show herd for sale and will not exhibit this fall. It reports a ready demand for these aristocrats of the breed and has already made sales of a boar and three sows by Mammoth Sensation Jr., eligible for the futurity and junior pig classes, to J. E. Thorp of Lockeford. Mr. Thorp also secured a senior sow pig that he will show. W. E. Bush of Covina also bought one of the junior boar pigs while the Sierra Vista Stock Farm took an exceptionally fine Ace of Pathfinders senior boar pig and two senior sow pigs by Mammoth Sensation Jr.; also a senior yearling sow by Great Orion Sensation and out of a Pathfinder dam.

MORE LIME

The Marl-Lime and Fertilizer Company has begun extensive operations on the lime deposit near San Dimas. Numerous chemical analyses of the material indicate it to be in fine condition for use as fertilizer. Situated as it is in the heart of the citrus belt transportation is a small item and the deposit will no doubt prove a boon to citrus growers whose chief trouble the past two years has been with regard to transportation.

Now is the Time to Apply

Victory Tree Spray

to your Citrus Trees, an ECONOMICAL and EFFICIENT METHOD for the control of SCALE PESTS, RED SPIDER and ALL FUNGUS TROUBLES.
We have an agent in every district.

FIRST PRIZE CALF HERD AT LOS ANGELES LIVESTOCK SHOW, 1920
Reading left to right—Blanchard 1st, junior champion, out of a Harris Standard 2d dam; Nevada 5th and Carnation 4th, both by Harris Standard 2d, the last named being reserve junior champion. Each of these sell.

ANNOUNCING

Jno. H. Cazier & Sons' Second Public Sale

80 Registered Herefords

State Fair Grounds, Sacramento, Cal., Tuesday, November 1

For this offering we have selected what we believe to be the greatest lot of Herefords yet to sell in the West and an offering that in whole or in detail is of such a character as to be worthy of the attention and patronage of any man or firm seeking cattle of unquestioned worth.

In considering the above statement we direct your attention to several facts.

It is generally admitted, we believe, that our herd is the largest collection of high class cattle owned in the West; that the bloodlines back of our cattle are not alone popular but have been proven to result in the production of cattle that for ruggedness and feeding ability combined with size, bone and quality can challenge any herd.

The character of our herd bulls can be judged by the fact that the get of our senior sire, Harris Standard 2d, can be found in the leading Western herds, and that the get of our junior sire, Beau Blanchard 76th, himself grand champion at Sacramento and Los Angeles last year, have distinguished themselves wherever shown or sold.

Our herd is now on the accredited list having passed three government tests without a single reactor. Our cattle are never inside winter or summer and have always adapted themselves to California conditions.

The offering will consist of about 60 cows and bred heifers, many of the cows with calves at foot and rebred; 15 choice open heifers and 6 very select young bulls of herd heading caliber, including the 1920 junior champion at Los Angeles and grand champion at Ogden.

Practically our complete 1921 show herd sells. SEE OUR CATTLE AT THE CALIFORNIA STATE FAIR.

The Nevada Hereford Ranch, Wells, Nevada

John H. Cazier & Sons Co.

Sir Prince Aaggie Mead

CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEDIGREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERD SIRE.

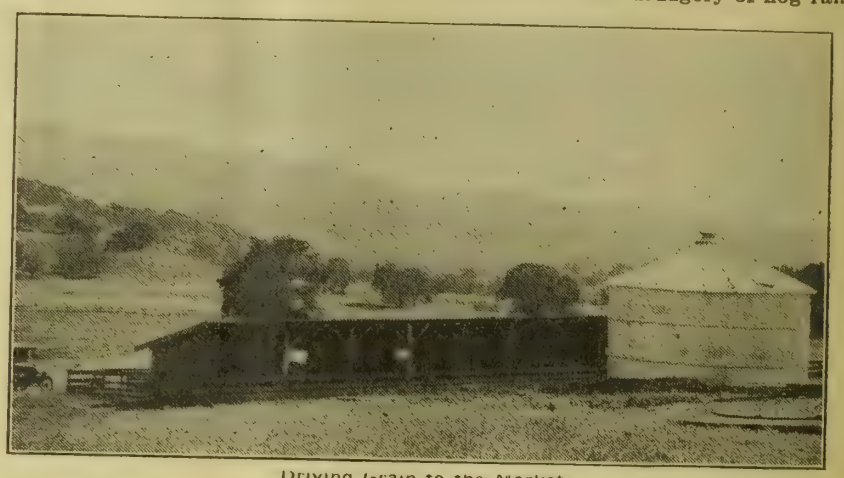
It Pays Better to Sell Grain "On the Hoof"

By R. G. Newman

THERE is food for thought for farmers and for other people in the derivation of our old fashioned word, shift. It has the same origin as thrift—in all probability the two are merely different forms of the same expression and not so many centuries ago could be used interchangeably. To this day we call the unthrifty man shiftless, and the expression to make shift, in the sense of practical and useful contrivance, is still good English. Shift and thrift are twin brothers.



Driving Grain to the Market

Small Calco grain bin installed on grain and hog ranch near Santa Ynez for storing grain for hog feed.

The fact is that both shift and thrift mean change or rearrangement and their significance in the frugal lives of our English, Scotch and Yankee ancestors was that of alterations in the methods and materials of industry and domestic economy to provide for changes in seasons, markets and other circumstances. The shiftless man was one who was too much bound by habit or mental indolence to make shifts to accord with changing conditions.

Thriftiness in this sense is just as necessary to the continued prosperity of the California farmer as to that of the Vermont dairyman or the Scotch wool raiser. Seasons change from year to year and make certain products scarce which have been abundant; new varieties of stock and new fruit or forage plants are imported or developed; and, above all, market conditions vary widely in the course of a few years or even a few months, making certain lines of farming profitable which have not been so for a time and reducing the net returns on other crops or stock almost or quite to the vanishing point. The modern business farmer keeps the closest watch on all these tendencies and shapes his plans accordingly.

A good instance is afforded by the market conditions surrounding grain and hogs during the past three or four years. The tremendous demand for grain resulting from war conditions rightly enough induced California farmers to sow as much as they could possibly care for, and had it not been for the repeated drouths, which no one could possibly have foreseen, the growers would have reaped abundant harvests of dollars for the prices of grain went to higher levels than ever before.

Soon after the armistice the price of live hogs began to fall. At once it seemed to thousands of hog raisers that there was no profit in feeding high priced grain to low priced hogs, and large numbers reduced their herds and many went out of the business altogether.

The summer of 1921 has brought another change. Grain prices have fallen lower than for several years, and hog prices show an upward tendency. Wide awake farmers are now telling themselves and their neighbors that there is more money in feeding the grain than in selling it, and hog yards are beginning to fill with active and ambitious young porkers, rooting and squealing at the troughs, each one bent on making a hog of himself.

The combination of grain, alfalfa and hogs has proven very practical on thousands of farms in the Middle West, and it is no less so on the Pacific Coast. Where an owner has satisfactory farm storage for his grain, like that afforded by metal bins, he can under present conditions make it yield far greater net returns than by selling it directly to the dealers. The hog manure is valuable also, and with this combination the ranch will improve in fertility from year to year.

As a general rule it is more profitable to sell grain and alfalfa on the hoof than in bales or sacks, and this policy maintains the farms in better condition and provides steadier employment for labor. With the perfecting of new types of automatic feeders and waterers the drudgery of hog raising has been greatly reduced and the business made more attractive to those who aim to accomplish results by other methods than those of main strength and awkwardness. The use of pure bred stock in place of scrubs has accomplished a vast improvement in the meat qualities of the animals produced. Altogether it seems certain that in the next few years the snouts of these rooters will lift many a mortgage.

VALUE OF PURE BRED OVER GRADE HOG

More and more from every section of the country is coming the testimony of the value of pure bred hogs and of the utter folly of the farmer who attempts to raise scrubs and grades. A Missouri breeder, writing in the Duroc Bulletin, hands out some sound advice in the following article:

"Much has been written and said regarding the pure bred sire, but we have overlooked another great fact that stares us in the face and one that goes hand in hand with the pure bred sire, that of the pure bred sow. Too much cannot be said and done in encouraging the farmer to have both. No better interest is realized on an investment than that on pure bred hogs. Why? No other farm animal reproduces itself so quickly and finds a market so readily. This is straying a little from our topic. In reality the value of a good pure bred sow cannot be overestimated. If she is the kind that produces a large, husky litter of long, tall, high backed pigs, her value can never be told. The offspring of a pure bred sow will make larger hogs than from a grade sow for the simple reason that she came from a strain that some master mind has spent years to develop into a large hog. This cannot be said of the grade, for no one is trying to improve them to that degree.

"For breeding purposes, the get of a pure bred sow mated to the pure bred sire will produce a hog of merit. A hog that is given a chance at a decent living will be the mainspring of independence for the future farmer and livestock man. Very often some farmer says that grades are good enough for him. Well, possibly so. But does he want to continue in the same rut that his forefathers have worn out? Does he want his children to do the same? Why not, in this age of advanced farming, practice what men who have given a lifetime of study and labor proved to be a conclusive fact? Why not give your children a chance at a better and more useful life than you have had? Don't you want them to take a better interest in the farm than you did? Don't you want them to have beter opportunities than

you have had? Don't you want them to have something real that will inspire them to devote their honest efforts to produce and develop a product of merit?

"Give your boy a pure bred gilt or sow and 99 chances to one you will be ashamed of your grade stock in less than a year's time. But give him a gilt or sow of grade stock and you can expect him to reap just what you have sown. You can expect him to remain in the same old rut that you have traveled so long. You may say that it takes so much money. Well, they do cost money, but show me anything of real worth and something worth while that is free. Can you expect your boy or girl to stay on the farm with long hours of toil and nothing for them to take especial interest in? Note that the most prosperous farmers today own pure bred livestock. You may say that they can afford them. My dear reader, you are sadly mistaken. Prosperous men would not own them if they were not a paying investment. Pure bred livestock is one of the greatest boosts that the prosperous farmer has ever had. They are one of the greatest stepping stones to success. Go throuh Illinois, Iowa and Ohio, three of the greatest and richest states, and you will find the man with the best improved farm, best home and most conveniences has depended largely on the pure bred sow. The pure bred sow has paid for their farms and equipped them with modern machinery. She has built their handsome residences and outbuildings and furnished them with labor saving devices. She has enabled them to purchase costly motor cars that they and their families might enjoy their leisure hours while she goes on and on producing and caring for her litters. It has often been said that 99 per cent of wealthy farmers trace their era of prosperity directly back to the pure bred sow. Is this not alone enough to convince you that it is time to relegate the scrub to bygone days and start yourself and your boy right with a good pure bred sow?"

JERSEY COW HAS TWENTIETH CALF

Twenty calves at 21 years of age is the breeding record of Financial King's Interest, a Jersey cow owned by Greystone Farms, Pensylvania. The last calf is a heifer and is one of 19 sisters, the other calf being a bull. This grand old cow has therefore been the mother of a fair sized herd and is still in a remarkably good state of health.

At 20 years of age she made an official record of 7,302 pounds milk and 400 pounds butter fat, and she has a previous record that was still higher.

She will be put on test again to test the limit of a cow at advanced age and also as an object lesson of what can be made from a cow whose years are so prolific in dairy products and calves.

Her last calf was sired by Financial Sensation, a grandson of the old cow, so that the calf is as close to being the counterpart of its mother as is possible.

Financial King's Interest is the only living daughter of Financial King, which was also the sire of Financial Countess, one time champion production cow of the Jersey breed. Financial King was a son of Interest, a cow that in her time was considered the best animal on the Island of Jersey. It is interesting to note that this great line of animals is being intensified as well as perpetuated by the owners of the cow that has 20 calves to her credit.

The premium list of the California National Livestock Show to be held in San Francisco, October 22 to 30, is by now in the hands of the majority of breeders. The show management requests that exhibitors make out their entry blanks and send them in promptly. This is an important matter as the detail work involved in getting out a correct and complete catalogue is really great. This initial show deserves the heartiest support of all interested in pure bred livestock. It is a show sponsored by livestock breeders for livestock breeders. Every breeder interested in the future of his business should get behind this show. Make up your mind to show.

SYCAMORE ACRES
ROBERT N. CLAPP
HOLSTEIN-FRIESIAN CATTLE
Nuevo, Riverside County, Cal.

—I AM HONEST

—In saying that I am putting forth every effort possible to breed Holstein-Friesian cattle that will be a credit to the breed, to California and to myself.

—I feel that with the proper blending of the blood of old King Segis I can develop animals which will make good in the show ring and at the pail.

—I have the tools to work with and want breeders and men interested in Holsteins to look them over at the Riverside Fair October 11th to 16th.

—When in need of Holsteins keep me in mind. If they don't make good I will.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

October 4, S. O. Walker, Visalia.
October 5, Robt. T. Curtis and Son, Tulare.
October 6, Alex Whaley, Tulare.
October 12, John Saxer, Modesto.
October 21, Robt. N. Clapp, Nuevo.
November 3, A. W. Morris & Sons, Inc., Woodland.
November 9, Palo Alto Stock Farm, Palo Alto.

Herefords

October 19, W. J. Bemmerly, Woodland.
October 27, Pacific Coast Hereford Breeders' Association, California National Livestock Show, San Francisco.
November 1, J. H. Cazier and Sons, Sacramento.

Shorthorns

October 28, California Shorthorn Breeders' Association, California National Livestock Show, San Francisco.
November 2, W. M. Carruthers, Live Oak.

Guernseys

October 20, Walter H. Dupee, Rhoades & Rhoades Sales Pavilion, Hynes.

A Guernsey event of outstanding importance will be the public sale of 50 head from the famous Edgemoor Farm, owned by Walter H. Dupee, Santee, on Thursday, October 20. The sale will be held at Rhoades & Rhoades' Sale Pavilion, Hynes. Forty young females will be included, representing a rich collection of May Rose breeding, and they are made doubly attractive because nearly all, if not all, of them will be safe in calf to the great sire, Masterpiece of Edgemoor, whose breeding and individuality are of such commanding merit that $40,000 was refused for him. Ten young bulls of splendid breeding and type will also appear in the sale list. In view of the tremendous demand for registered Guernseys and the scarcity of breeding animals available for purchase, this sale will be of tremendous importance to those wishing to buy foundation stock of high quality.

The famous herd of registered Herefords owned by J. H. Cazier & Sons Co., Wells, Nevada, has now passed its third consecutive tuberculin test under federal inspection and has been admitted to the list of federal accredited herds. Prior to federal testing the herd had gone through a number of years of tuberculin testing without a reactor. This well known firm will make its annual public sale offering at Sacramento on November 1, selling about 75 head, the list of females made up largely of daughters of the great breeding bull Harris Standard 2nd, and bred to the $10,000 Beau Blanchard 76th. Five or six young bulls of real herd heading quality will also be sold, and the offering will include practically the entire show herd that the Caziers will have out this year.

On Wednesday, October 12, one of the most attractive herds of registered Holsteins in Stanislaus County will be dispersed at public auction. This is the herd owned by John Saxer, Modesto, and besides being a herd of excellent type is of particularly good breeding, including three daughters of Sir Skylark Ormsby Hengerveld.

A remarkable record has just been completed by a registered Holstein heifer in the Baywood herd, owned by The Lewis Co., Hollister. Freshening last year as a senior four year old, this heifer, Sarala Segis Pontiac, made an official record of 35.41 pounds butter in seven days. She recently freshened again as a senior four year old, within 12 months of her previous calving; and at present has over 37 pounds butter in seven days to her credit. She is sired by Segis De Kol Pontiac Burke, a son of Segis Pontiac De Kol Pontiac Burke, and the 1,000 pound yearly record cow Miss Blaney.

Karlray Ormsby Alcartra, the great daughter of King Segis Alcartra Abbekerk, that sold for $1,850 to R. Stevens, Stockton, in the 1921 Guaranty Sale, recently presented her new owner with a fine bull calf sired by the three times grand champion bull, King Segis Alcartra Prilly. It will be remembered that she made a yearly record last year of 22,947 pounds milk and 916.24 pounds butter as a junior two year old, the second highest record for age in California. With little rest she calved this year as a junior three year old, and placed on official test, was thrown off feed and became seriously sick. Thirty days after calving she had apparently recovered and was again placed on official test and made the nice record of 26.51 pounds butter from 589.1 pounds milk in seven days.

Lady Walker Pontiac Zenobia, a daughter of Prince Hiske Walker, owned by H. G. Ball, Tulare, recently calved at the tender age of one year and eight months, and on official test made 13.07 pounds butter from 316.2 pounds milk in seven days, a production that would be creditable in a heifer much older.

Bonita Larcola Glista, owned by R. Stevens, Stockton, calving at one year and ten months of age, recently made 13.61 pounds butter from 311.9 pounds milk in seven days. She is a daughter of Supreme Glista Pietje.

St. Mawes Lad's Lady, a senior yearling Jersey owned by Harry D. Illif, Independence, Oregon, has broken the world's record for fat production for her age. The old record of 800.8 pounds of fat was surpassed when she still had nine days to go. It is expected that she will finish with about 825 pounds.

Bullard Bros., Woodland, have sold to B. D. Phillips of Oakland a flock of 104 Rambouillets.

Southern California breeders will be well represented in the livestock departments at the state fair this year. Cash and Kyne, owners of the Sierra Vista Ranch at Perris, and the George Junior Republic at Chino, will exhibit Holsteins. The Brant Rancho of Owensmouth will exhibit Guernseys. William V. Mong, Whittier, Sierra Vista Ranch of Perris, and J. C. Craig of Owensmouth will each have 17 or 18 Durocs. The Italian Vineyard Company of Guasti will take up 25 head of Berkshires and D. J. Bastanchury of La Habra will show a number of Berkshires also. Homer Graham of the Eastman Ranch of San Fernando will show full herd of Poland Chinas. James Marwick of Santa Barbara will show Angus cattle, Hampshire hogs, Guernsey cattle as well as turkeys, Black Minorcas and Indian Runner ducks.

We Can Show You How to Feed Stock Profitably at Today's Prices

In spite of today's conditions, California Dairy and Stockmen **can** make a profit, but it must come through greater use of the cheaper roughages and the use of **balanced rations.** Scientific analysis of feeds and the proper combination of protein, vitamines and carbohydrates must take the place of haphazard methods.

Where to get the Advice of an Expert---FREE!

For the benefit of Dairy and Stockmen throughout the state who are facing the problem of vanished profits we have installed a FEED ANALYSIS DEPARTMENT, in charge of an expert. The services of this man are absolutely free to any man who feeds stock. Our expert will tell you what to feed, **how** to feed it, how to use your own roughage combined with highly nutritious food that can be purchased at a reasonable price.

Build a Profit-Making Ration from the Feeds You Have at Hand

It makes no difference what you are feeding now. We can show you what the correct proportion of Camo Pure Hawaiian Cane Molasses should be with first-cutting alfalfa, volunteer oat hay, wheat straw, bean straw, or beet-tops, pea vines, rice bran, or barley screenings.

The Importance of Molasses in the Ration

PALATABILITY is a big item in stock feed. Cattle do not get all the food values out of cheap roughages because they are not palatable. They do not chew them enough because they do not like them. Molasses is a candy to cattle. When you add molasses to your feed it becomes immediately a treat for the stock. The molasses sticks to the gums and the cattle chew and rechew their food. And bear this in mind: one pound of molasses equals in food value one pound of corn, and is a better food, for molasses is assimilated immediately by the system, while corn requires several hours to digest.

Camo Pure Hawaiian Cane Molasses is 100 per cent FOOD! Use it with your roughage. Ensilage alone is not a fat and milk producer. Sweeten the unmarketable stuff you have and feed it scientifically—and at a profit to yourself.

Begin Today to Feed Scientifically

Scientific feeding is in its infancy, but its results are readily apparent. As larger acreages are divided and intensive methods become more universal the problem of correct feeding becomes even more intense. Make a start now, **today,** with the aid of our expert's free advice.

Write Our Feed Man

Let him show you how you can feed stock at today's prices and **make money!** Send in samples of your own feed. We will analyze it and tell you whether or not you are getting the most from your feed.

Send in this Information—and Begin to Feed Correctly

W. H. Young Company,
58E Sutter Street,
San Francisco, Cal.
Gentlemen:

Please hand the following information to your FEED ANALYSIS DEPARTMENT for their consideration and forward their report to me.

1. I am feeding.....head of Dairy Cattle..... Beef Cattle.....
2. My herd consists of (name breed and grade of stock) .....
3. At present I am feeding (give ration).....
4. I am getting the following results.....

.....

Bassett Bros. of Hanford promise to make a stronger showing of Poland Chinas at the state fair this year than has ever appeared under their banners.

J. I. Thompson of the Harold Hopkins Ranch at Davis is going to show a few exceptional Poland Chinas. At the head of his herd is Frisco Boy, a junior yearling boar, who boasts an excellent back and 11 inch bone.

For the twelfth year A. B. Humphrey will show at the state fair. His herd of Guernseys and Berkshire hogs this year is one of the best he has ever shown. Mr. Humphrey has always been a consistent winner in both classes and this year should be no exception to the rule.

The Ortega-Underhill Rancho of Santa Barbara is contemplating a trip to the National Swine Show with a herd of Hampshire hogs of its own breeding. On account of this trip the O. U. R. herd will not be seen at the shows of this state.

Chas. MacDonald, manager of the Santa Anita Rancho, has just sold a fine two year old Percheron stallion to A. Camarillo of Camarillo, Ventura County. Mr. MacDonald reports considerable interest in horses and jacks from this state and from the South and Central American countries.

JERSEY BREEDERS MEET

The annual meeting of the California Jersey Breeders Association will be held in the Assembly Rooms, State Fair Grounds, Sacramento, at 7:30 o'clock, Monday evening, September 5. All persons in the state interested in Jerseys are invited to be present and attend this meeting.

Auction Sales

I am prepared to conduct auction sales of farms, farms and equipment, or pure bred livestock of any kind. I am thoroughly familiar with the pedigrees of cattle and of the different breeds of hogs. My customers are my best advertisement and they are to be found in all localities. My terms are reasonable. Write, wire or phone.

PURE BRED CATTLE BREEDERS MEET AT STATE FAIR

The state department of agriculture, division of animal industry, is arranging for a conference of pure bred cattle breeders to be held Wednesday, September 7, at 11 a. m., in the assembly room over the secretary's office in the Agricultural Building, at the fair grounds, Sacramento. The purpose of this conference or meeting is to call together the pure bred cattle breeders and others interested in livestock to discuss ways and means by which we can best serve them in carrying out the provisions of Assembly Bill 38, which delegates authority to this department, in cooperation with the United States bureau of animal industry, to conduct accredited herd work in California.—J. P. Iverson.

HOG FEEDING SUGGESTIONS

Now that many California ranchers are again turning to hog feeding as a means of marketing a part of their grain, the following conclusions by H. K. Dickson, local club agent of the Kern County High School, covering two years of carefully conducted feeding trials, should prove of interest. Mr. Dickson says:

"A self feeder always full of ground feed is part of the Boys Agricultural Club hog program. Then the hog gets his feed when he wants it and always enough. A self feeder full of ground barley, used with alfalfa pasture, is a very satisfactory way to feed grain.

"Drawing the different conclusions gained from our tests and sets of figures together, one has the following guide to his hog feeding:

"A good sow with a litter of seven or eight pigs, growing fast enough so that they will weigh 55 pounds each at 70 days, will usually use from two to three pounds of grain or grain equivalent for every pound increase weight in the little pigs. This will cover the sow's feed from two weeks before farrowing and all the feed of sow and pigs until the pigs are 70 days old.

"Pigs smaller than 90 pounds can hardly eat enough food to cause them to gain an average weight of a pound per day. The larger the pig the more he can eat and the faster he can put on gain. Hogs weighing from 175 to 200 can easily be made to gain two pounds per day.

"Pigs which are once badly stunted or allowed merely to live without gaining, are an expensive proposition, since it requires the waste of a large amount of feed to start them to growing normally again. Our results required eight pounds of grain to make a pound of gain for the first two weeks on stunted pigs.

"Shoats on good alfalfa pasture, accompanied by a full self feeder of ground barley or ground milo, will make a pound of gain on about 3½ pounds of grain, plus the alfalfa pasture. The poorer the alfalfa the more grain it will take.

"Good thrifty shoats in the dry lot, eating from a self feeder of ground barley, corn and tankage, and in addition getting a slop of soaked ground grain twice a day, make a pound of pork from 4½ to 5 pounds of grain, probably using 5 pounds in the majority of cases. If skim milk can be used with the grain the amount of grain needed will be lower, as in the case of alfalfa pasture, and will depend on the ratio between the amount of milk and grain."

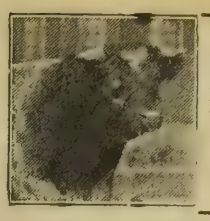
FOR AGRICULTURAL UPLIFT

(Continued from Page 212.)

time to house the big show. The following year extensions were made, and nearly three acres of additional canvas housing was required to take care of the pure bred stock from a dozen states and many points in Canada. In anticipation of greatly increased demands this year the legislature appropriated a $100,000 building extension fund.

The Pacific International property represents an investment of more than half a million dollars.

Premiums offered in the various classes of beef and dairy cattle, horses, swine, sheep and goats are in excess of $75,000 each year. The attendance records of the 1920 show totalled more than 75,000, and the number of animals exhibited was above 3,000.



Shorthorn steers are selling right along at the top of the leading markets. Buyers pay a premium for Shorthorn quality and growers get the advantage of the extra weights also. It is a good time to buy Shorthorn breeding stock.
Note the Shorthorns at the fairs.

MILMAR---
the Utmost in
SHORTHORNS
A Herd With a Purpose

This herd was founded on the conviction that a real service could be rendered the cattle business of California in making available Shorthorns with individuality and breeding the equal of the better Eastern herds, and that such cattle would meet with ready appreciation. After several years of careful breeding we are now able to show a class of cattle of which we are modestly proud. We invite critical attention to our exhibit at the fall fairs and to our herd. Breeding material can be supplied in keeping with your needs and at satisfactory prices.

HERD BULLS

When You Think Shorthorns—THINK MILMAR

Thos. T. Miller Hollister, Cal.

We Breed Shorthorns

because we have found that this sterling breed is best adapted to California conditions; because through the use of Shorthorn blood we are able to produce market steers that sell at younger ages, carrying more weight, and that sell for more per pound than common stock. Important facts all, as we are raising cattle for profit—not pastime.

We Show Shorthorns

because we take pleasure in publicly demonstrating the merit of our cattle. The success of our herd at the leading Western shows is, we take it, evidence that our cattle are correct in every way.

We Sell Shorthorn Bulls

because we are producing more than we use on our own ranges and because we are glad to furnish California cattlemen with the same kind of bulls that have built up our herd and made ours a profitable business.

Humpty Dumpty's Great Climb

By Jean A. Koethen

AFTER war was declared in August, 1914, California poultrymen found themselves discouraged and depressed. The bottom had dropped out of the poultry industry, so many said and not a few believed. Feed prices were rising and eggs were cheap. The faint hearted let go and sold their plants for what they would bring, while the more couraegous spirits held on, not because they were making money but because they had caught the possible by the hair and must hold on. It was for such a time as this and because it seemed the only way out that the Poultry Producers of Southern California was organized early in 1915. The market must be stabilized and the producers induced to hang together, or in the words of a distinguished patriot they would surely hang separately.

That was six years ago. Now, in midsummer of this year of grace 1921, we are in a position to take a backward glance and gather from the last statistical table of the Poultry Producers the data regarding and the lessons, if there be any, to be drawn from the pyrotechnical rise in egg prices and the inevitable fall which must sooner or later follow such a rise.

Wholesale Prices

The average wholesale price of eggs on the Los Angeles market in 1915 was 28.97 cents, and poultrymen were holding their hens at a net loss of 22.7 cents per hen. How they could do this and live I do not understand. Probably it was because they did not count in the overhead cost of $1.20 per year per hen and managed to eke out a precarious living on the very narrow and uncertain margin between cost and selling price of eggs. That year the average cost of feeding a hen for a month was 13.43 cents. The overhead of 10 cents a month brought the total cost of a hen up to 23.43 cents, and the average market value of her eggs, which ranged from 13.5 cents in October to 30.4 cents in April, was 21.54 cents, a loss of nearly 2 cents a month for every hen.

The figures for 1916 are a little better. The average price of eggs for the year was 31.20 cents, but cost of feed had risen along with the price of eggs till the cost of feeding a hen a month was 13.9 instead of 13.43. The total net loss for this year was only 9.3 cents, and the poultryman's heart must have been cheered as he realized that if he was not actually out of the hole he was at least a little nearer the top.

The average of the market was still climbing in 1917. In November it reached 56 cents, which was 8 cents above the highest price in 1916 and 12 cents above the highest point touched in 1915. If only the price of feed had not climbed with it the poultryman would have broken even. As it was, feed cost per month jumped to 21.02 cents per hen, which brought the year's cost of keeping a hen up to $2.52, plus the $1.20 for overhead, which few indeed had the courage to face. The average of the Los Angeles market for the year was 35.06 cents, a hopeful sign which made the year's net loss of 12.4 cents per hen a little less depressing. The poultryman had slipped back in his effort to climb out of the hole, but at least he could see the sky above.

A Big Jump

Salvation came in 1918, armistice year, when all prices went sky high and eggs along with them. Feed prices were high enough, but the average cost of feeding a hen a month increased only .72 of a cent while the market average jumped from 35.06 cents to 51.61 cents, an increase of nearly 50 per cent. Now at last after four or five years of struggling the poultryman was clear out of his hole and up in the bright sunshine of prosperity. His total net gain for the year was 78.66 cents per hen. If a man only had hens enough he could buy an automobile. He could at least keep his family in shoes. To be sure, the total cost of a hen for the year was $3.80, but he had become so accustomed to high prices he didn't much mind that, and the balance to his credit at the bank looked mighty good.

By 1919 the poultryman began to feel really prosperous. He painted his home and patched up the cracks in the laying house. He hadn't the money to spend that carpenters and brick masons had; his wife couldn't possibly manage a fur coat, but she would not have known what to do with it if she had had it. The jingle of money in their pockets was pleasure enough. The average market price for the year reached 54.64 cents. The average for November was 75 cents, and there were weeks when the retail price did not drop below 90 cents. Now the poultryman was a man of affairs. Sometimes he was even classed as a profiteer, along with the shoe men and the grocers. Feed costs had advanced only slightly and eggs were still going up. It cost $2.73 to feed a hen, and $3.93 to keep her for a year, but even at that his total net gain was $1.075 per hen.

We have heard a good deal in times past about the dollar hen, and poultrymen have figured that if they could make a dollar a hen per year they were doing about all that could be expected, but have they stopped to consider that in the best year poultrymen have known in Southern California they made only $1.07, counting all expenses? The trouble with poultrymen has been and still is that they do not count everything. They count feed and the labor they actually hire, but they are content to work themselves and let their wives and children work for little or nothing, while, as for counting telephone, stationery, repairs, replacements, taxes, and all the necessary expenses of keeping up a plant, these are entirely outside their calculations. One item of the overhead, which is included in all calculations on this chart, is "labor used in excess of proprietor's fair time, to include excess labor of proprietor and his family." That is, if the poultryman's wife sits up nights with the brooder chicks her time should be counted in. If his children clean the houses and gather the eggs their time must be counted at reasonable wages. If he himself puts in more than the eight hours the commonest workman in the building trades calls a day, he must charge it up. Labor is labor, wherever and by whomever performed, and this is a land of equal rights. If one man is content with fewer rights and privileges than his neighbor that is his own affair.

At the Peak

Food cost for 1920 reached 25.29 cents a month, or $3.03 for the year, which made the total cost of a hen $4.23, but eggs reached their highest average, 55.83 cents a dozen, the average for November being 82.04 cents, the highest average of this period of high averages. The market average did not, however, quite keep pace with the cost of feed, and the total net gain for the year was only 72.51 cents, where it had been $1.07 in 1919. Feed prices were at their very highest this year, the average price of wheat per hundred being $4.48. It had touched $5.50 in 1917, but, thanks to Mr. Hoover, had not remained there long. There were five months in 1920 when it was over $4.50 and not until November did it drop below $4.40. This was the beginning of the end. By December it had dropped to $3.75 for the first time since war was declared, and the first three months of 1921 brought it down to $3.15.

Humpty Dumpty's Fall

The price of eggs did not keep step with the price of feed as prices went up, but they dropped together. This was to be expected and is not perhaps entirely to be deplored for no poultryman wishes to be called a profiteer. By March eggs were selling at an average of 30.96 cents wholesale, and we all know how cheap they have been since. The monthly gain per hen, which in 1919 reached 30 and 31 cents

in some months, in March was 10.64 cents, but the feed cost which in March, 1920, reached 28 cents had dropped to 20 cents.

This table, which was compiled by F. D. Cornell for the Poultry Producers, is not computed past March. What his average will be when reports are all in for 1921 each poultryman must figure for himself. Whether the fall in prices is due to the invasion of eggs from China and other foreign countries, or to overproduction, or is just the inevitable reaction which every business is experiencing is a question we cannot discuss here. Possibly all three causes have contributed. The farmer must adjust himself to new conditions, but there is every reason to believe he will adjust himself more readily than other industries because he has not been led so far afield. The farmer, and under farmer I include poultryman, has always been satisfied with less profit than other men, has always been more willing to put his shoulder to the wheel than others when Uncle Sam appealed for help, and will prove himself in the end the sanest and most patriotic of all producers. If only farmers will hang together as other industries do, they can get anything they want. If they continue, as they were in the old times, timid, suspicious and unwilling to root for the organization, they will no doubt pay the penalty.

Poultry Queries

(Conducted by Jean A. Koethen.)

Lice on Hens

Would like to know what to do for hen lice. We have cleaned, spaded and sprayed but lice still remain.—Subscriber, Fallbrook.

Dusting, dipping and greasing are the standard remedies for lice. Dusting with any good louse powder or with sodium fluoride every three or six months should keep them clean if the hens have access to a dust bath. In warm weather dipping with sheep dip is often effective, but it is harder on the hens than dusting and greasing. Blue ointment mixed with vaseline, half and half, and applied about the vent with the tip of the finger, an amount the size of a pea being used for each hen, is by some experts considered more effective than dusting, but the ointment must be applied with care as it is quite poisonous if used full strength. Greasing under the wings and about the vent with plain lard is an excellent remedy, but it makes very dirty hens. Unless you employ some of these means for ridding the hens of them they will always have lice.

POULTRYWOMAN WRITES OF OPPORTUNITIES

In an editorial of August 13, entitled "Learn the Game," you state that you often receive inquiries as to land and a chance to make a living in Southern California.

I judge that you are often puzzled as to what to reply, as the capital possessed is small and land here is usually high.

It occurred to me to call your attention to this valley, a level mountain valley (1,500 feet altitude) of about 25,000 acres. Land here is cheap, around $100 per acre. The climate is good. There is a small country village with groceries, dry goods, hardware and drug stores, blacksmiths, lumber yard, bank, an unusually good inn, churches, primary, grammar and high schools; 35 miles north from San Diego, with daily mail, passenger and truck service.

Enough water from wells for irrigation in a small way. The best place in the world for poultry. If a person likes to work with poultry he can make a good living here. With four or five thousand dollars he could with care start a good house and poultry plant and have a living assured.

We are yearning for more residents, so we can get electricity for lighting and pumping. I would be glad to furnish any further information.

I have a farm here and am in the poultry business on a commercial scale.

I have no land for sale.—Mrs. Clara K. Graham, Ramona.

DIRTY EGGS AGAIN

"We sometimes wonder," writes the management of Poultry Producers of Southern California, "if our members realize that the only reason we can move our surplus eggs to other markets, especially to New York, is one of 'quality,' due to rigid grading when packing eggs for that market. This means that we must remove all of the 'off-grade' eggs of every description and ship only clean, white eggs of the very highest interior quality. It culls out the 'dirty' eggs, both the very dirty eggs and those only slightly soiled, also all brown or tinted shells and any other eggs showing evidence of heat, or otherwise 'off-grade' in any way.

"Where shippers are careful in handling and caring for their eggs, cleaning all soiled eggs and segregating each grade in separate fillers, the number of culls is comparatively small, and their removal an easy matter. On the other hand, where shippers are careless about their nests and the sanitary condition of their houses and yards, or in storing their eggs before or after packing for the trucks, it makes too many of these culls to dispose of, except at a loss, while the mixing in of the dirty or soiled eggs with the others greatly increases the cost of grading at the station.

"Our graders can handle eggs which have been properly graded and packed at the ranch, three dozen at a time, picking up the entire filler with the three dozen eggs and the flat under it and transferring it to the new case at one time, but if they have to stop and pick out one or two dirty, soiled or tinted eggs from each filler before transferring, it means just that much more expense in the labor cost of putting up a 'standard' pack of eggs.

"We are, therefore, again asking every member to use still greater care in securing a high quality product from his hens, and when he has that, to so handle and pack it that it reaches our station in first class shape for the graders to make quick work of the transferring.

"Be sure that you clean all soiled eggs, segregate the grades so that there are never two grades in the same filler, and mark all cleaned, or washed eggs with the special colored slips and thus do your part in reducing our operating costs."

WEIGHTS OF WHITE LEGHORNS

It is extremely difficult to determine by merely looking at a flock whether they are as large as they should be for their age or for the time of year. The only accurate method of knowing whether one's birds are making the proper gain is to weigh them at different intervals, then their weight at any age may be compared with a table of normal or standard weights. The following from the poultry experiment station at Storrs, Connecticut, shows the age at which Leghorns should attain the weights indicated: Chickens, 1 pound, 8 weeks; pullets only, 2 pounds, 14 weeks; pullets only, 2½ pounds, 17 weeks; pullets only, 3 pounds, 21 weeks.

ALFALFA WEEVIL SITUATION

At a meeting called by the state department of agriculture at Sacramento, August 2, attended by representatives of the Alfalfa Growers of California, dairymen and officials of Nevada and California, practicability and justice of a quarantine against the entire state of Nevada was considered. It was agreed by all present that a quarantine against White Pine and Washoe Counties in Nevada is sufficient for the present, provided Nevada will add to her present enforcement the inspection of automobile traffic going from the infested areas to non-infested areas in Nevada. The Nevada officials agreed to this and further agreed to eradicate the alfalfa now growing in the auto camp at Sparks. These measures will insure a greater measure of protection to California, as well as to Nevada.

A cooperative arrangement was effected whereby the California inspector now stationed at State Line will be given Nevada authority and moved to a point in Nevada where three roads branch into California. This arrangement will help to protect Douglas County in Nevada, which would be a distinct menace to California if allowed to become infested, and will enable the inspection of traffic arriving in California on three roads, one of which has not been thoroughly patrolled.

Onions: Supplies moderate, movement moderate, market firm. Stocktons: White Globes, sacked per cwt. 2.75@3.00, Yellows 2.75. Old stock: Browns, 1.25@1.75. Locals: Whites 2.50@2.75 per cwt., Browns 75@85 per lug, Whites 90@1.00 per lug.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock August 23, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Beans: Supplies light. Demand moderate, market seady. Per lb.: Kentucky Wonders mostly 4@5 per lb.; Green pods mostly 4. Limas: Supplies moderate, movement moderate, market steady, mostly 5; few 4.

Beets: Supplies moderate, market steady. Per dozen bunches mostly 35 @40.

Cabbage: Supplies light. Market stronger. Per field crate 2.25@2.50.

Carrots: Supplies light, market steady, per dozen bunches mostly 35@40.

Celery: Supplies light, movement slow, market steady, per crate 5.50@6.00.

Corn: Supplies moderate, movement moderate, market steady. Local: Per lug, wide range in price, 65@95; mostly 75 @85.

Cucumbers: Supplies liberal, movement slow, market steady. Locals: Lugs mostly 35@40; pickles, 1.25@1.75 lug.

Eggplant: Supplies liberal, demand slow, lb., 3@4; few 5.

Lettuce: Supplies light, market firm. Local: Field crates mostly 90@1.00, poorer 75 per crate; fancy 1.25.

Peppers: Supplies heavy, market steady. Locals: Bells mostly 60@80 lug. Chilis mostly 3@5 per lb.

Radishes: Supplies light, market firm, mostly 15@20 per dozen bunches.

Squash: Supplies light, market steady. Summer mostly 50 per lug.

Tomatoes: Supplies moderate. Demand and movement slow, market weak. Locals: No. 1, per lug, mostly 90@1.00; fancy 1.25, No. 2, 50@75.

Turnips: Supply moderate. Market steady. Per dozen bunches 35@40.

FRESH FRUITS

Apples: Supplies liberal. Movement slow, market weaker. New stock: Mostly 50@60 per lug, loose per lb., 3@4. Sebastopol section, B grade Gravensteins 2.25 @2.75, mostly 2.35@2.50. Crabapples mostly 1.25@1.50 per lug.

Cantaloupes: Supplies very heavy. Demand and movement moderate, market weak. Homegrowns: Tiptop, per crate 40@65, mostly 50, Paul Rose and Rocky Fords 50@75. Casabas: Supplies liberal, movement slow, 1½@2½ per lb., according to quality.

Figs: Supplies heavy. Market weaker, prices lower. Locals: Per box 1.00@2.00, mostly 1.00@1.25.

Grapes: Supplies liberal, movement slow, market dull. Wide range in quality. Thompson Seedless mostly 4@5; Muscats and Malagas mostly 5@6.

Peaches: Supplies heavy. Demand moderate, market slightly stronger. Freestones mostly 1.00@1.10, few fancy 1.25 @1.35, poorer 60@75, Clings 90@1.00, few best 1.10@1.25. Few fine quality J. H. Hales from Yucaipa meet strong demand.

Pears: Supplies heavy. Demand moderate, market steady. Bartletts 4@5, best 6, poorer 3 per lb.

Plums: Supplies moderate, market steady. Satsuma plums 4@5 lb.; Wicksons and Kelsey, 4@5; prunes, various varieties 3@5.

Quinces: Lug, 90@1.00.

Watermelons: Supplies heavy. Demand slow, market weak. Turlock section: Mostly 1@1½ per lb. Locals: Klondikes mostly 1@1½ per lb.

HONEY

Supplies of old crop light, of new crop moderate. Prospects are good in Northern California but in the southern part of the state the early dry spell was not compensated by the later rains, and perhaps one-third of a crop looked for. Light wire inquiry. Demand and movement lighter than for previous two weeks. Market firm on White Orange and White Sage, mainly on account of short crop. Quotations are all on new stock. Carloads f. o. b. usual terms at loading points—White Orange 9½@10, mostly 10. White Sage 10; Light Amber Sage 7@7½. White Mesquite 6, Light Amber Alfalfa 5. Old crop White Orange low as 8. Hawaiian old crop practically cleaned up, new crop not ready; no sales reported. Beeswax: Supplies liberal. Demand limited. Crude wax offered by dealers 23@25 per lb.

GRAIN AND FEEDS

Grain Exch. price bid August 23:
Milo: 100 ton lots, 1.53.
Barley: 100 ton lots, 1.26.

HAY

Alfalfa Growers of California report:

Market showed little change during week. Receipts small, with prices well maintained.

In most local marketing districts demand and volume of business show improvement, with widening difference in prices above those of central markets, amounting in some localities to as much as $5 a ton above central markets.

There were 780 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending August 20, with 310 tons held over.

Big Saving to Bean Growers

Prospective buyers of side delivery rakes are making a great mistake if they purchase before they thoroughly investigate the wonderful value offered in the Thomas Side Delivery Rake, either right or left hand, which has been built for work in the bean fields. There is no better rake built than the Thomas Side Delivery Rake. It embodies every feature necessary for the successful handling of beans and has so proven itself in the hands of hundreds of satisfied users.

Through a fortunate purchase Dixon & Griswold of No. 130 North Los Angeles Street, Los Angeles, are in position to offer the bean grower as fine a side delivery rake as can be bought at any price for the ridiculous figure bean grower will be $100.00 f. o. b. his Side Delivery Rakes have never been cheaper, in a great many years. Why spend additional money to buy a rake no better, perhaps not as good because it is in the hands of some mercantile house which is obliged to ask a higher price for it?

We urge the purchase of this rake through your dealer, but if for any reason your dealer does not care to take your order (which he can handle by merely telephoning your order to us), write or telephone us direct. We guarantee the rake in every particular. Notwithstanding anythiug you may hear to the contrary, these rakes are absolutely the latest style and pattern of rake built by the Thomas Manufacturing Co. The rake is the equal of any in performance and superior to most of the so-called side delivery rakes for beans.

A liberal stock of repairs is available at all times. The price to the of $100.00 f. o. b. any railroad point. railroad station.

Pineapples: 4.00@5.00 dozen.
Pears: Bartletts, No. 1, wrapped, 2.50@2.75 bx.; other grades, 1.50@2.75; 75@1.75 lug.
Plums: Santa Rosa, 50@1.00 per crate; other varieties, 50@1.00 per crate, 1.00 per lug; egg plums, 50@90.
Prunes: Cr., 1.00@1.25.
Quinces: 1.25@1.50 lug.
Raspberries: 60@75 per drawer; some 85.
Strawberries: Peninsula and Watsonville, 50@60; Watsonville cr., 1.00@1.30.
Watermelons: ¾@1¼ per lb.; 1.00@3.00 per doz.

DRIED FRUITS

Prunes, 1921 (Cal. Prune & Apricot Growers): Sunsweet Quality, bulk basis: 30-40s, 9c; 40-50s, 8c; 50-60s, 6½c, 60-70s, 6c; 70-80s, 80-90s, 90-100s, 5½. Growers Brand ¼c less on all sizes. All prices subject to change at any time.

BEANS

Below California Bean Growers Association shippers prices choice recleaned:

Large Whites	5.00
Small Whites	4.50
Pinks	6.20
Mexican Reds	6.00
Red Kidney	9.00
Henderson Bush	4.00
Cranberries	5.50
Bayos	7.50
Blackeyes	4.50

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:

No. 1 Dairy	15.00
Standard	14.00

Under date of August 20, A. W. Scott Co. says:
Receipts continue heavy and demand light with a consequence of a forced market and general dullness. Better grades are comparatively scarce and have held up fairly well, but there has been an oversupply of low grade so that the difference in value between the best grade and the poorest grade is wider than usual. There is hardly a sign of life in the local alfalfa market. Mill and dairy feeds are depressed and generally lower, feeling the effect of the Eastern market and the continued liquidation.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay No. 1	15.00@18.00
Wheat Hay, fair grade	13.00@15.00
Tame Oat Hay	12.00@15.00
Wild Oat Hay	10.00@12.00
Alfalfa Hay, later cuttings	12.00@14.00
Stock Hay	8.00@10.00
Barley, Ground	31.00@33.00
Rolled	29.00@30.00
Oats, Rolled Feed	30.00@32.00
Bran and Millrun	28.00@30.00
Middlings	40.00@43.00
Linseed Meal, Nominal	37.00@40.00
Cocoanut Meal	22.00@25.00
Alfalfa Meal	22.00@24.00
Cottonseed Meal	35.00@40.00
Sugar Beet Pulp	32.00
Molasses, Tank	21.00 Barr 25.00
Milo Maize	38.00@41.00
Corn Meal & Crkd Corn	38.00@41.00
Scratch Feed	45.00@48.00

GRAIN

Wheat: Milling, 1.90@2.00; feed, 1.90@2.00.
Barley: Feed, 1.22@1.27½; shipping, 1.30@1.45.
Oats: Red Feed, 1.25@1.40.
Corn: California yellow, 1.55@1.60; Eastern yellow, 1.55@1.60; white Egyptian, 2.20@2.30 per cental; California red milo, 1.80@1.90; Eastern red milo, 1.80@1.90; Eastern kafir, 1.75@1.80.

Citrus Markets

Shipments
Shipments of citrus fruits to date since November 1, 1920, Southern California' Oranges, 35,454 cars; lemons, 9,933; total, 45,387. To same date last season: Oranges, 27,420; lemons, 7,179; total, 34,599. From Central California to date this season: Oranges, 6,644; lemons, 212; total, 6,856. To same date last season: Oranges, 5,377; lemons, 289; total, 5,666. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 23; total, 284.

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 40,000 subscribers. Weekly Liner rates: Single insertion 4½ cents per word; 45c per issue minimum charge. Cash with Order
Mail all classified copy to Los Angeles Office.

POULTRY

Continued requests are being received by the California Cultivator for varieties of poultry not advertised in our columns. If any of you, our readers and friends, have any you wish to dispose of, send a small advertisement to this office and you will be doing our readers a service as well as yourselves.

Day Old Pullets—Here is your chance to get day old White Leghorn and Ancona chicks guaranteed at least 90 per cent pullets. We are taking orders fast for August and September delivery. We also have R. I. Red and Barred Rock chicks but do not separate the sex. All chicks are from strictly thoroughbred laying stock and are hatched right and shipped by Special Delivery Parcel Post. Send for prices and get your orders in at once. We also have a limited number of pullets from two to four months old and yearling hens. Orange County Hatchery, Santa Ana, California.

Mission—FALL CHICKS—Hatchery **White Leghorns** — Our superior laying strain means early maturity and heavy laying; hatched right; priced reasonable; any quantity. Also trapnested Brown Leghorns that are winners. R. I. Reds, Barred and White Rocks, Black Minorcas. Prices run from 13 to 18 cents, depending on breed and quantity. Safe delivery, parcel post or express. Write for circular at once as fall supply will soon be booked up. Mission Hatchery, Campbell, California.

Petaluma Hatchery—Established 1902 by L. W. Clark. White and Brown Leghorn chicks from heavy laying free range stock, every Monday and Thursday. We positively guarantee safe arrival and full count of good strong chicks and no questions asked. Send for prices and terms. L. W. Clark, Petaluma, California.

Fine Young King Pigeons $3 a pair. Guineas $5 a pair. Wyandotte, Partridge Rock and Leghorn eggs $3 a setting. Are disposing of some of our breeding geese; offering them at a bargain price. Yearlings $15 a pair, 2 year old birds $20 a pair. All bred from imported stock. Send for catalog. Paradise Valley Poultry Ranch, National City, California.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, $1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

White Leghorn Baby Chicks — Walter Hogan stock. We get all our eggs from one flock of over 4,000 Walter Hogan hens that have been carefully Hoganized. Our specialty is first class White Leghorn hens that satisfy our customers. We will have chicks September 1st. Lyon Hatchery, Gardena, California.

Baby Chicks—Barred Rocks and Reds, 25, $5.00; 50, $9.50; 100, $18.00; White Leghorns, 25, $4.25; 50, $8.00; 100, $15.00. Shipped every Monday, Parcel Post, special delivery, prepaid. Established 1915. Hargett & Son, Route 2, Box C, Compton, California.

Chicks Every Week from good layers. Fall Broilers pay. Pullets make good layers. R. I. Reds, Barred Rocks, White Leghorns. Safe arrival guaranteed. Write for circular. Stubbe Poultry Ranch & Hatchery, P. O. Box 67, Palo Alto, California.

White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live, vigorous chicks guaranteed. No money in advance; pay on delivery. Prices on request. Established 1898. MUST HATCH INCUBATOR CO., 438 Seventh St., Petaluma, California.

Baby Chicks from my carefully selected, heavy laying strain of pure bred S. C. White Leghorns. Am booking orders now for August and September delivery. Write for prices. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

Baby Chix from selected, mature S. C. White Leghorn hens. Safe arrival, full count, strong chix, insured. Hawley's Hatchery & Poultry Farm. Route A Box 315A, Lodi, California.

Barred Plymouth Rocks — "Wonderful Layers," champion prize winners. Nothing better in poultry. Choice stock and hatching eggs. Catalog free. Charles H. Vodden, Los Gatos, California.

White Leghorn Baby Chix from Petaluma's heaviest producing stock. We guarantee safe arrival. Literature on request. Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

"Eastman's Bred-to-Lay" Barred Rocks. Fall Chicks—March, April pullets. Fairmead Poultry Farm, Fairmead, California.

Success in business is attained by experience and knowledge. The poultry business can be made to pay by following the teachings and information contained in POULTRY FOR PROFIT, $1.00 postpaid. Cultivator Publishing Company, Los Angeles, California.

SEEDS AND PLANTS

Reliable Seeds—Ask your dealer or write for our Reliable Seeds and Instructive catalog. AGGELER & MUSSER SEED COMPANY, 620 S. Spring Street. Branch—767 S. Central Avenue, Los Angeles, Cal.

LIVESTOCK

Shorthorns, Shropshires, Berkshires, Shetland Ponies, Bronze Turkeys. W. P. Rocks, Butte City Ranch, Box C, Butte City, Glenn County, California.

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

FARM LAND FOR SALE

FARM RENTERS
You can become a farm owner on terms very much like those you are now paying to rent land. We have deep, rich soil with complete irrigation and drainage systems. We are willing to cooperate with hard working, reliable men who want to become owners of farms. Sutter Basin (in the heart of the Sacramento Valley) is your opportunity. Write now.
SUTTER BASIN COMPANY,
California Fruit Bldg., Sacramento, Calif.

Ten Acres Full Bearing Apricots and Peaches—30 tons 'cots this year; 6 room modern house, 2 room tent house, barn, garage, chicken pens, 100 hens. Located 1½ mile east of Hemet on Florida Avenue. Mtg. $3000. Will consider mostly exchange, mostly for rental property or smaller home clear, in any good Southern California town. Mrs. C. A. Lawrence, E. Florida Avenue, Hemet, California.

For Sale—40 acre ranch under three different irrigation systems. Two sets of buildings, would divide. Rich sandy loam suitable for alfalfa, fruit or gardening. Located in Monterey County in the Fort Romie Colony. Half mile from good grammar school; 4 miles from town. At $600 an acre. If interested inquire of owner, L. E. Pugh, R. F. D. Box 14, Soledad, California.

For Sale — Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

CATTLE

Registered Ayrshires — Three Canadian Ayrshire cows five and six years old; two bulls of Robin Hood breeding, one and two and a half years old; three heifers from these cows, eighteen, eight and seven months old. Price reasonable. W. G. Akers, Gato Ranch,, Santa Barbara, California.

For Sale — Several registered Guernsey bull calves, one old enough for service, Edgemoor Farm breeding, reasonably priced. Apply to Dr. J. A. Woodside, Santee, San Diego County, California.

Guernseys — Grape Wild Farms—Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Yearly Record Holsteins—Bulls from 500 to 1,000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

For Sale—80 head of range cattle. Address C. Eichenhofer, Palmdale, California.

Some Choice registered Holstein heifers and bulls of serviceable age for sale. J. W Scudder, Escalon, California.

Winsor Ranch Jerseys—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

MACHINERY

For Sale 40 rebuilt windmills, tanks, pumps, steel towers, cylinders, rods. Special new 1,000-gallon galv. tanks, $39.25; 2,000, $53.25; 3-in. irrigating pipe, $14.75; 4-in., $18.75; also used pipe. Why pay more? Demmitt, 120 N. Main, L. A.

For Sale—Pomona Pump, 28 head; 30 Holt tractor, Saunders plow, disk cultivator. Clarence Wagner, Terra Bella, California.

WANTED

Wanted—Unsulphured dried figs and other unsulphured fruit. Write for information. Martin A. Witt, 120-122 West Ann Street, Los Angeles.

We Will Buy your Calla Lily roots. If you have 100 or more, write us. Sevin-Vincent Co., 512 Washington St., San Francisco, California.

Farm Wanted — Wanted to hear from owner of a farm or good land for sale; possession this winter. L. Jones, Box 569, Olney, Ill.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT. Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

BUILDING MATERIAL

POULTRY RAISERS ATTENTION!

Fresno DISTRICT FAIR

Event of the Year in the San Joaquin Valley

6 BIG DAYS
Sept. 26 to Oct. 1

Last year 120,000 persons attended the Fresno District Fair.

This year, with prizes increased in every department, and many new classes added, the attendance will exceed 200,000.

Prize list totals $15,000.

Write at once for premium list to:

Chamber of Commerce

Fresno, California

Attention Farmers---Bredall Improved Beardless Barley

We are offering for the first time direct to the farmer our celebrated barley which has out-yielded anything we have tried so far along with it in our acre test plots. We also have Mariout and Beldi barley. Dart Imperial, Bunnyip, and Early Baart wheats. Seeds.

WHY NOT? -Grow more per acre? Be free from bearls? Raise a better grain hay? And last but not least buy direct from grower?

We are supplying several Asiatic and European Governments with our Beardless barley, who are now introducing it in their countries.

When Writing Advertisers Mention California Cultivator.

Curly Dwarf of White Rose Potatoes

By A. T. Hooven

OF THE many varieties of potatoes that have been tried in Southern California, none has shown itself better adapted to requirements of this climate than the White Rose. It is the earliest of the white potatoes, not excepting the Cobbler. It is a splendid shipper and well known on Eastern markets. It seldom cuts hollow and is rarely knobby. Also, it seems to adapt itself to various soil conditions. On rich soil it sets and develops a heavy crop. On poor soil it makes a light setting but develops what potatoes it sets to marketable size, whereas most other varieties planted on poor soil make a heavy setting but fail to develop them to marketable size.

In Southern California the spring crop is planted from January to April and dug from May to August. The fall crop is planted in August and harvested in November and December. It is impossible to hold potatoes from the spring crop for next spring planting except by cold storage, which is expensive and has not been as satisfactory as was at first expected. So potatoes from the fall crop are used for spring planting. This condition means that the same variety of potato must be both an early and a late variety. That is, it must be capable of growing in cool weather and in hot weather. No other variety except the British Queen has so far shown this quality. American Wonder, Irish Cobbler, Green Mountain, etc., are of no value for August planting, although they do well when planted in the spring. However, their unsuitability for fall planting leaves the grower without seed for spring planting, except by cold storage or import. Most growers prefer to raise their own seed.

Now although the White Rose has many admirable qualities, it has one defect that is very serious; it is very subject to curly dwarf. Unless a remedy is found this variety is very apt to become profitless.

If a grower is fortunate enough to secure a start with smooth leafed stock he will notice after a crop or two, curly plants here and there. The next planting will show about 25 per cent curly, and the next planting is very likely to be entirely curly, just an occasional smooth leafed plant. The curly plants make a crop but it is only a fraction of what the smooth healthy plants make.

The obvious remedy for this would seem to be to rogue out the curly plants and leave only smooth plants for seed. In my experience this method has not shown itself to be the solution. In the fall of 1915 smooth leafed plants having not less than four pounds of marketable potatoes were chosen from a field. These were planted with the main spring crop, their location of course being noted, and they were very carefully watched, as great things were expected of them. It was sad to note that they exhibited the same per cent of curly leaf as the main planting.

Professor Shear conducted some experiments in Modoc County. Potatoes from smooth leafed plants were planted in tuber units, that is cuttings from the same potato were planted in a definite location. He observed that cuttings from the same potato gave some curly and some smooth leafed plants. While these experiments are by no means conclusive, still they are not encouraging for the roguing out method in a two crop climate.

It is possible that the curly dwarf is caused by the potato not having sufficient rest period between plantings. Dug in June and planted in August, dug in December and planted again in January or February, it may be that not sufficient time is allowed for the chemical action which changes the starch of the potato to sugar. As the potato sprouts in the ground the starch in the cutting changes to sugar and nourishes the young plant. If this action were deficient or incomplete curly dwarf might result. It is possible to tell the curly plants as soon as they are a few inches high. On very rich soil where the sprout rapidly establishes its independence of the cutting the curliness is not so acute. However, such soil is rare. It is also true that in a one crop climate curly dwarf gives little trouble.

Last fall some of the best obtainable Los Angeles grown White Rose were secured and planted this spring in Humboldt County. They showed a very large percentage of curly dwarf. The curly plants have all been rogued out, and the potatoes from the smooth leafed will be planted in March, 1922. It is hoped that a crop of smooth leafed plants will result, as this will be raising the potatoes under normal conditions, starting with smooth leafed plants and allowing a rest period of several months under natural storage. A few curly ones will be planted in order to note if there is a chance of the potato recovering in a one crop climate.

A few years ago a Los Angeles firm had some White Rose grown on contract in Oregon. Seed from a fall grown crop was used and the resultant crop shipped South and used for spring planting. It was very curly.

White Rose is now little grown in the north, as one experience with the curly dwarf is usually enough for the northern grower. However, it is hoped that by holding this variety in the north for a few seasons that the curly dwarf may be eliminated.

Growers on the Atlantic Coast south of the Mason and Dixon line and even many New Jersey growers have long given up the idea of raising seed for spring planting. Many of the larger growers own farms in Maine and raise their seed there for southern planting. Maine growers take great care to raise seed free from disease and to meet requirements of growers in the south, so the problem on the Atlantic Coast may be considered solved.

Whether such a system is necessary in Southern California for permanent success in potato growing is not certain. My own ten years of experience and observation in potato growing in Orange County would, however, so indicate.

KEEP MANURE MOIST AND APPLY GYPSUM

By Professor Geo. A. Olson

Moisture is of considerable importance in relation to the keeping qualities of barn manure. A high percentage of moisture tends to keep the manure particles bound together in compact form. A low percentage tends to keep the particles separable and apparently the manure is less compact.

The cold manures, such as cow and pig dung, usually contain higher percentages of water than are found in hot manures such as are voided by sheep and horses.

The cold manures are very plastic. This physical condition whereby the moisture and particles are held together serves as a closed gate against the entrance of air. The bacteria which bring about the wrong kind of fermentation and decay thrive only in the presence of air. The admission of air is therefore undesirable and the physical condition explains why the excrement from cows and pigs is regarded as being cold.

The fact that the hot manures contain less moisture and are comparatively more open in nature is favorable to easy access of air. In the presence of the air decomposition takes place and the chemical changes which are rapidly brought about raise the temperature, hence such manures are regarded as being hot.

The moisture contained in carelessly or loosely piled fresh manure will gradually disappear, thereby altering the physical condition of the manure so that the air can easily gain entrance. It is this condition which hastens fermentation and the loss of the most valuable fertilizer component, nitrogen.

Careful packing or letting the cattle tramp over the manure pile will tend to maintain a satisfactory moist condition and suppress fermentation. The inclusion of agricultural gypsum is effective in holding the ammonia nitrogen, it also reduces the loss of organic matter.

Under conditions where the manure

is not properly packed as much as 70 per cent of the ammonia nitrogen may be lost unless agricultural gypsum has been used to tie up this valuable and expensive plant food.

It is imperative that the manure pile be kept moist and compact. Liberal applications of agricultural gypsum should be made for two reasons; first, to preserve the organic matter, and second, to prevent the loss of the gaseous ammonium carbonate. Agricultural gypsum changes the ammonium carbonate into a very stable ammonium sulphate. The transformation readily takes place in the moist manure pile.

THE STATE FAIR

(Continued from Page 195.)

waving of flags and the yards upon yards of bunting, together with the tremendous activity which is everywhere apparent makes one realize that he has at last reached the great state fair.

Immediately before us, standing out as the central permanent structure, is the great Agricultural and Horticultural Building, 488 feet long and 112 feet wide. Before going there, however let us turn to the left and visit the big automobile tent. Last year it contained 89 models of well known cars, fashioned in all the elegance that the automobile maker's art can devise; this year we are promised even a larger and finer exhibit. This tent is well filled, and as we pass through we observe the superb upholstery, the magnificent body lines and the unmatchable refinements. In an adjoining tent are housed the accessories which go to make automobiling a safe and satisfying recreation. We note spark plugs, shock absorbers, lubricating oils, automatic brakes, speedometers, magnetos and hundreds of improvements which may be added as necessity or convenience dictate.

To the right is the truck tent where from 60 to 70 trucks of various sizes are on display. Beyond is the Manufacturers' Building. This is a beehive of activity, for it contains mechanical contrivances of every description from the phonograph to the washing machine, and dozens of machines are in constant operation.

To the left is the Educational Building which houses the work of deaf and dumb schools, Indian schools and the cities' public schools, revealing the marvelous work done by the state institutions and public schools for the development of California children.

Let us cross the broad drill grounds and enter the magnificent Horticultural and Agricultural Building into which are gathered exhibits from almost every county in California. From the cotton of the Imperial Valley to the lumber of Siskiyou, from the oranges of Los Angeles to the minerals of Modoc, great sections are utilized in a display of the products of our valleys and mountains. The arrangement of the exhibits is most pleasing. Bunting in various colors is used in abundance. Counties compete to produce displays that present their products to the best advantage, mammoth cornucopias pouring forth fruit in abundance, towers of peaches or apples or oranges, minature houses made of pears or raisins. The combinations of decorative art are so pleasing that one wishes to tarry long in this magnificent building. Not only does it display the fruit and the products of the soil but usually exhibits showing the state's measures for prevention of disease and for the prevention and extinguishing of forest fires. A very elaborate series of views and models of the state's institutions is usually shown with lecturers accompanying the exhibits. Splendid views of every part of California are there and commercial exhibits bearing upon the fruit and vegetable industry. The balcony exhibits show tremendous progress in agricultural and horticultural pursuits. Diseases of trees and fruit are graphically pictured with life size models in many instances. Methods of rodent eradication are most valuable and interesting. Parasites and pests of all kinds are shown with the most effective way of destroying them.

As we emerge at the south entrance we are confronted by the big tents of the power on the farm exhibit. There is nothing at the state fair that attracts so much attention. The principal exhibits are the big tractors. There are usually from 30 to 40 different models of various sizes, close to 100 machines in all, from the small garden variety to the 90 horsepower which is used in the big wheat fields and ranches. Accompanying these are the implements for breaking up and pulverizing the soil.

Adjoining the dairy barns are the lighting plants. Modern lighting plants have done much to improve conditions on the farm and at last year's exhibits we counted over a dozen different types.

Close to the lighting plant exhibit is the building of the University of California. Here lectures are held covering every phase of agricultural development. There are also exhibits which are particularly interesting and which bear upon the productivity of California.

To the left of the Educational Building is the big Poultry Building. Last year there were 660 pens and the best birds of the state were on display. The poultry exhibit includes rabbits, pigeons, turkeys, ducks, geese and wild fowl from the state game farm.

In the afternoon everybody attends the races, where prizes aggregating over $15,000 are awarded. The grandstands are filled to overflowing and their seating capacity is about 25,000. On the mile race course are held all kinds of events, saddle horse races, bareback riding, chariot races, man and horse races, dog races, together with gladitorial combats and fancy riding, displays by trick horses and at night a wonderful fireworks display.

To put it mildly, the state fair merits the attention of every agriculturist in California. You cannot fail to realize great benefit not only from an educational standpoint, but from the standpoint of a diversion from routine work upon the farm.

We must not fail to mention the sideshows. They include wild men from foreign lands, fortune tellers, tattooed men, giants and dwarfs, fat men and women, living skeletons, fire eaters, trained animals of all kinds, weird freaks of nature, negroes from the sunny south and Eskimos from the frozen north. On past occasions we have had the Igorottes from the Philippines. Each year sees added features and we are told by the management that there will be no disappointment this year.

The big day will be September 9. Not only is it a legal holiday, but it is also Sacramento Day. As a special feature the world's best athletes will compete in track and field meets.

Last year's attendance was 205,000 with 55,000 as the largest single day. Everything points to a bigger and better fair this year and a greater attendance than ever before.

Every man or woman who ever won anything knew how to Dig.

Choose Only a Leader

Since Byron Jackson produced the first pump that virtually gave birth to irrigation in the West the position of leadership of this pioneer company has been undisputed.

Time has only served to make the Byron Jackson product the standard of attainment in the pump industry.

The deepwell turbine here illustrated is but one of the many pumps manufactured by this company—all products of expert engineering, workmanship and material.

Byron Jackson service is an integral part of the purchase of a Byron Jackson pump, beginning at the factory testing department and following the pump through its installation and the years of its operation. Our statewide service car system assures you of having Byron Jackson engineering brought to your very door.

Let us show you the Byron Jackson answer to your water problem

Efficient Equipment on California Farms

Of the 6,448,366 farms in the United States only 644,088 have water piped in the houses. This is practically one out of ten. California homes are different. There are in this state, or rather were in 1919, according to the census report showing conditions on January 1, 1920, 117,670 farms. For the convenience of the homemakers 65,928, or over 56 per cent of these, have water piped in. One in ten in the U. S.; considerably better than every other one in California; in fact, California topped every state in the Union. Even old time settled New England and the Middle West can none of them show as great a number of well equipped homes as does California. The state which makes nearest approach is Pennsylvania with 46,402 homes on her 202,252 farms with piped water. New York and Ohio are also close competitors with Pennsylvania but each of them nearly 20,000 behind California.

Nor is the equipment of our homes the only place where California shows an advanced position, for in automobiles, trucks, tractors, telephones and lighting this state is with the topnotchers.

CALIFORNIA EFFICIENCY

In California there are 117,670 farms. The U. S. Bureau reports:

	Number of farms owning one or more	Percentage of farms	Total number on farms	Rank
Automobiles	62,453	53.1	71,518	8th
Trucks	5,909	5.0	6,416	6th
Tractors	12,131	10.3	13,852	5th
Telephones	37,309	31.7	.....	20th
Water Piped	65,928	56.0	.....	1st
Lights	30,519	26.8	.....	4th

Automobiles

The number of farms in the United States which reported equipment with one or more automobiles was 1,979,564, or 30.7 per cent. In California 62,453 farms reported automobile equipment. This is 53.1 per cent. The total number of autos on these farms is 71,518. Presumably this is not half the number used by California farms today. However, it is a good figure to use in comparing this with other states of the Union as conditions were, so far as could be secured by census report, on January 1, 1920. States reporting more than half their farms equipped with autos were Nebraska, Iowa, South Dakota, Kansas, Minnesota, North Dakota, with California and Illinois ending the list of toppers.

Motor Trucks

States which lead in motor truck equipment are small states which have great cities. For instance, the District of Columbia, which reports only 29 farms also reports 14.2 per cent of them supplied with motor trucks. The only states which approach the District are New Jersey and Rhode Island. But of real farming states, those showing greatest number of motor trucks are: Pennsylvania with 9,372; New York, 9,259; Iowa, 8,910; Ohio, 7,319; Nebraska, 6,548; California, 6,416; Illinois, 6,154. In percentage California tops all these with 5.0.

Tractors

Three and six-tenths per cent of the farms of the United States were reported as having tractors, January 1, 1920. This was one farm out of every 28 and means a total use in farming operations of 246,139 tractors on that date. In actual numbers California stands fifth among the states; in numbers the order is: Illinois, 23,102; Iowa, 20,270; Kansas, 17,177; Minnesota, 15,503; California 13,852; North Dakota, 13,006; South Dakota, 12,939; Nebraska, 11,106. These eight states report more than half of all the tractors on farms in the United States. There were 38.2 tractors for every 1,000 farms for the country as a whole while these eight states made a showing of 106.8 for every 1,000 farms and California 117.7 tractors for each 1,000 farms.

Telephones

Of all the farms of the United States there were 38.9 per cent with telephones. In this respect California fails to reach averages and the possible explanation is in her mountain ranges and great distances. Of California's farms 37,309 reported telephones. This is 31.7 per cent.

Water and Lights

As noted above, here is where California leads off. Water equipment is reported in —(Continued on Page 247.)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Figures make dry reading, but there are some on this week's cover which are far from being dry. They show much as to California's rank among other states of the Union in power farming and farm equipment. Best of all, they show California as a home making state and first in the Union in that wonderful blessing, running, or rather piped, water in the home. California stands first not only in greatest number but in percentage of homes so equipped. In autos, tractors, and power farming equipment, in every case, we are with the Upper Ten.

* * *

We referred last week to the packer control bill and the fact that the packers are yet in entire control. Meantime, however, the Packers and Stockyards Act has passed; it has been signed by the president; now comes word from Washington that the president has signed an appropriation bill calling for $240,000 to be placed in the hands of the secretary of agriculture, this to make up for the lack in the original bill which carried no appropriation for enforcement.

* * *

Next week there will be a bit of advance story regarding the fruits and other exhibits in the horticultural building at the state fair. The following week there will be description of tractors and farm power appliances and stories of some of the world's finest livestock—this we are safe in saying because California produces some of the world's finest.

* * *

A local paper representing one of the smaller communities near a larger trading center in this state makes complaint: It appears that some of the smaller farmers in the smaller community, only a portion of whom own trucks, unite in shipping their produce to the larger community by bunching their loads and delegating one of their number to haul to the larger market or shipping point. This has resulted, in one case, in the arrest of the driver who was hauling his own and neighbors' peaches to the cannery on the charge that he had not secured a municipal "truck license"; in another, in arrest and fine of $21.80; in another—to save arrest—in the payment of a $25 license fee. If we are correctly informed in this matter, we feel that farmers are very unwise to continue trading in such a community. The Cultivator has been a consistent booster for "Trade in your home community." It's a public spirited step and it builds up and betters your own home. But there is reasonable reciprocity demanded, and any community which drives people away by unfair treatment of necessity suffers great loss of good will.

* * *

Former Governor Frank O. Lowden of Illinois remarks that "Where we find the best agriculture, where we find the farms in the best state of tillage, where they have the greatest prosperity, there we find the largest measure of cooperation among the farmers." And we think we are safe in reminding the ex-governor that the best in agriculture and the largest measure of cooperation both obtain in California.

* * *

Speaking of scrubs, they multiply just as fast as pure breds or high producers, but they never get the right answer.

* * *

Right now at the end of harvest time the mails are burdened with appeals to save the starving of central and eastern Europe. Last season the farmers of the country placed 5,000,000 bushels of grain in the hands of various relief organizations. There are many thousands of lives saved because of this sacrifice made by American farmers and, we may add, by all classes in giving this grain and in transporting. The same hunger exists in the near East, in Hungary, in Poland, and now comes a cry indicating awful conditions in Russia. The response to Russia's cry will not be as free as was that to the others who were suffering, but the poor wretches in Russia who are starving are not the ones who are to blame for the awful conditions which prevail.

* * *

An appeal is made for more "ideal homes" in California. It would take too long to enumerate on this page all of the things which should enter into the ideal, but here are some suggestions for the unideal home: Build the pig stye, if not directly in front of the house, at least nearer the road than the house; put the barn well in front so that the roadside may be used for storage of unused implements; save the labor and water which would be required for a plot of green, shade trees and a row of flowers; economize on paint, running water, bath tubs, electric fans or appliances—but why enumerate more, the American mother will not consent to raise her children excepting in the best and most inspiring surroundings, and if it becomes necessary to maintain such "homes" in order to compete with Japanese labor, we will all quit and give the lands to those who can live under such conditions. "The countryside has slums as well as the large cities," but Cultivator readers are not slum dwellers.

DR. WEBBER BACK

At the August meeting of the board of regents of the University of California, Dr. H. J. Webber was appointed professor of citriculture and director of the citrus experiment station at Riverside. Dr. Webber, who at present is at Hartsville, South Carolina, was formerly professor of plant breeding and director of the citrus experiment station in the state university. It is reported that Dr. Webber will be in California to take up this work by October 1. He will be stationed at Berkeley.

COOPERATIVE INSURANCE

"Figures won't lie," but we mortals have a way of arranging them sometimes so that they do not do full full justice to the case in hand. In the fourth column of Page 196 last week we touched upon "Cooperative Insurance," giving particular commendation to Farmers Mutuals which have saved to farmers and others in this state many thousands of dollars and, still better, given insurance which is dependable and which has never paid losses other than 100 cents on the dollar. In that article we referred to the two largest cooperative insurance concerns in California, being those of Fresno and Los Angeles Counties, each "carrying around $15,000 insurance." This is where the figures lied, or rather three insignificant little ciphers failed to get into line and made our 15 millions of dollars look as if California insurance was pretty small potatoes. So, to repeat: There are 23 mutual fire insurance companies in California, two of which are carrying over $15,000,000 each.

CLING PEACH GROWERS

Cling peaches now have a friend at court. Dr. Moulton, president of the Sutter County Peach Growers, has been active in increasing interest amongst Sacramento Valley canning peach growers until they have awakened to the fact that they must fight their own battles. A letter from Mr. McLeod, manager of the new association, which will probably be state wide in its activities, writes:

"Thirty-odd delegates were elected during our membership campaign in the San Joaquin Valley, representing most of the important peach districts. These delegates met at Stockton, Friday, August 26, and passed resolutions expanding the Sutter Peach Growers into what is to be known as the 'California Canning Peach Growers.' Mr. Moulton, president of the Sutter Peach Growers, Inc., should be thanked by every cling peach grower in the state for his activity during the past six months in their behalf. It is through his untiring energy that the growers of canning peaches are to have a state organization. Committees have been appointed to put the finishing touches upon the rules and regulations which are necessary to the successful operation of any cooperative plan. We have many examples of success and failure to follow and beware, therefore, the cling peach growers have less excuse for failure in this undertaking than any previous association."

FINANCIAL CONDITIONS

The most enlightening information on financial and trade conditions may now be secured through monthly or semi-monthly reports or letters which are sent from various large banking institutions, giving conclusions reached by the more farseeing in the financial world.

Amongst these, and the most general in its scope, is that made by the federal reserve board of the 12th district through the federal reserve bank at San Francisco. This has increased in size until it now is of 20 pages. It is called "Agricultural and Business Conditions of the 12th Federal Reserve District." Note the precedence given to the word "Agricultural." And not only is precedence given to the word, but in the text the industry is given precedence in location and in space accorded. Over a third, in fact, nearly one-half, is devoted to crop conditions of the district, later touching more particularly upon wheat and barley, fresh peaches, pears, apples, dried fruits of all kinds, canned fruits, livestock, wool and dairy products. The remainder of the report is devoted to fisheries, lumber, mining, petroleum, hydro-electric development, manufactures, retail and wholesale trade, commerce, labor, building permits, business failures, bank clearances, savings deposits and other financial matters.

The middle August report takes an optimistic view from the following facts: "Canners of fruits report distinctly stronger demand for their products." "Approximately 75 per cent of the district's 1921 wool clip of nearly 73,000,000 pounds has passed out of growers' hands by actual sale to dealers at prices from 12 to 18 cents per pound." "Heavy showers have benefited ranges previously suffering." "Marketing of this year's grain crop is proceeding rapidly, and many are selling, immediately after threshing, in contrast with tendency to hold for higher prices which obtained this time last year." "Exports of wheat from Portland and Puget Sound ports during July, 1921, were 2,972,519 bushels, compared with 2,213,923 bushels same month 1920." "Final disposition of California apricot crop has been made during the last four weeks. The yield is estimated to have been 105,000 tons." "Prices to growers of fruit advanced generally during the last part of July." "The California Pear Growers Association disposed of the fruit under its control at $61.75 per ton for No. 1 Bartletts. Oregon Growers Cooperative Association sold its pool for $65 per ton." "The wool clip is estimated approximately 90 per cent of 1920 clip, which was 81,000,000 pounds. Seventy-five per cent of the clip has been sold outright." "A large proportion of the wool going to Eastern markets has been by rail to Pacific Coast points, thence by boat to Panama."

Financial conditions are indicated by the fact that the bank clearances have decreased slightly over the month of July in 1920, while savings deposits have increased.

California Cultivator

Vol. LVII, No. 10 | Los Angeles, September 3, 1921 | One Dollar Yearly

Orchard Management Studies in Tulare County August, 1921

By Roland Vaile and Gordon Surr.
Read by Prof. Vaile at Growers' Meeting, Strathmoore, August 26, 1921

JUST two years ago the citrus growers of Tulare County asked the University of California through its citrus experiment station to cooperate with them in solving the problems connected with the low production of citrus fruits in the Central California districts. The problems seemed very general ones although more intense on the adobe soils than elsewhere. We frankly admitted at that time that we did not know just wherein the trouble lay—much less did we know the solution for the problems involved. It seemed clear that there was no way to find the correct answer except through careful and continued study of the entire situation, and on that basis we gladly attacked the proposition. We feel justified now in stating what we believe to be some of the needs of the citrus groves and we will suggest solutions for some of them. The matter is complex, and in fairness to all concerned we believe that we should discuss more than merely the handling of soils.

The 1920 federal census shows that the 1919 yield of oranges in Los Angeles County was 3.2 packed boxes per tree while for Tulare County the yield was only 1.0 box per tree. Census figures are apt to be wrong, but our office has attempted to collect figures on orange production and orchard operating costs for the past seven years and during that time we do not believe that the orange business of Tulare County has paid expenses in any single year. Individual groves have, of course, yielded splendid returns and individual growers have had splendid bank accounts, but the industry as a whole has quite certainly shown a net loss. This is a serious charge which real estate dealers may resent, but in this case we believe that the disease must be recognized before a cure may be hoped for. We believe thoroughly that large crops of fine quality fruit can be produced from the majority of Tulare County groves. It is only this faith that allows us to spend our time and your money on the problem. The example of some of the oldest groves in the county has for years justified this faith; the example of some of the younger groves today equally justifies it.

There has not been enough money spent on annual care of the average citrus grove with the result that there has been a lack of detailed attention to important matters and many things have either been left undone or else done poorly. We would not for a moment suggest the spending of money just for the sake of spending it, but it is probable that the average expenditure in this county for the maintenance of orange groves is $75 less per acre than it is in Los Angeles County, and we believe this to be closely related to the difference in average yields.

There are at least three excuses offered for this low expenditure here: First, the example of a few very favorably situated groves that have produced handsomely with seemingly small expense; second, the somewhat prevalent idea that Tulare County soils are naturally so rich in plant food as to require little or no fertilization; third, the unfortunate circumstance that many growers have lacked both the capital and the credit to do what they knew should be done. The first two of these excuses should be dismissed from mind. There is no soil that will long continue to produce crops of oranges without regular and liberal fertilization, particularly with nitrogenous and organic fertilizers; there are no trees that will continue to produce crops of oranges unless they are kept free from insect pests; all groves need especial care in the application and conservation of irrigation water; the best of judgment is required if soils are to be tilled at the right time; in a word consistent care throughout the year is essential, and consistent care is high priced, but not necessarily expensive.

The third excuse deals with a banking problem. I am advised that intelligent and careful growers can always increase their borrowings temporarily to finance any sound policy of fertilization or pest control. Certainly both the grower and the banker would be playing a losing game if this were not so for mortgages cannot be protected nor business be maintained on one box per tree yields.

Lack of adequate fertilization is probably the point at which most of the saving of expense has been made. Certain it is that today one of the most obvious needs of a great many groves is increased fertilization. The value of liberal tree feeding is clearly shown on such properties as the Hammond Lumber Co.'s groves at Venice Cove, the Thompson orchard east of Lindsay, Mr. Rookie's grove south of Lindsay, the Elliott grove at Strathmore, and several others that have been consistently fertilized for several years. Differences are now being evidenced on the experimental plots both at Lemon Cove and at Porterville between fertilized and un-fertilized trees which indicate that mature grove management which omits fertilization for even as short a period as two years is poor business.

The business of fertilizing citrus trees in California is not new, nor does it appear to be essentially different here than elsewhere. Two things are predominate and certain; organic matter that will readily decompose is essential, and nitrogen is equally essential. If these two essential requirements are met it is more than likely that the fertilizer problem will be satisfactorily taken care of. For this purpose the use of stable manure, bean straw, or slightly damaged alfalfa hay in the fall of the year, followed by the use of tankage, fish scrap, cotton seed meal or any similar concentrated material in the early spring, gives a possible program that is flexible enough to meet the fertilizer market situation and yet consistent enough to care for every need of the trees. Sometimes, especially on somewhat "run-down" groves, it is desirable to reinforce the tankage or what-not with sulphate of ammonia or nitrate of lime. About 150 to 200 pounds of actual nitrogen should be applied to each acre annually; generally speaking it is desirable and good economy for at least half of the nitrogen to come from the concentrated spring application. If such a program is followed the requirements for plant food elements other than nitrogen will quite surely have been taken care of. The soundness of such a procedure has been verified so often throughout the citrus districts of California that it now seems unassailable and we believe thoroughly that this program may be used successfully on any citrus-grove soils in Tulare County.

The pest control problem is equally ever present. No other one thing will react on the crop of a citrus tree so disastrously or so rapidly as a bad infestation of scale. This has been unfortunately demonstrated in numerous groves this year. Keep your grove commercially clean from scale at any cost. As to method we suggest that you follow the recommendations of your county horticultural commissioner or his local representative; he is the one disinterested party best qualified to give advice on this question.

A year ago we particularly stressed the question of irrigation, at that time dealing primarily with practices on the adobe soils. During this (1921) summer we have continued our observations at Lemon Cove on the very heavy adobe soil and have also studied the conditions that have existed in the Capt. Anderson grove east of Lindsay. This latter grove is located on so-called Madera loam soil, a granitic sandy loam of medium texture underlain in this case with hardpan at from 6 to 10 feet. This soil takes water fairly freely but has a marked tendency to bake and become flinty upon drying; its water-holding capacity in the field is low and the margin between the point at which plants will wilt and the total capacity is not large. It is, however, typical in these and other respects of large areas planted to citrus in this county.

One thing stands out with clearness for both the heavy adobe and the medium loam soil type: A shorter interval between irrigations than has usually been allowed in the past would be a decided advantage. On our Lemon Cove plots we have applied water to the heavy adobe soil quite regularly at intervals of 28 days this summer. Many growers on this soil type have in the past applied water only once every 40 to 60 days and have then allowed individual furrows to run for five days or at times as much as ten days. In our practice this season we have held the water from 24 hours to a maximum of three days in the furrows. The irrigation results this season have been thoroughly satisfactory from every standpoint. The trees have never wilted and have been kept in vigorous growing condition throughout the summer, also there has been ample opportunity for cultivation between irrigations. The practice of frequent irrigations is not usually recommended for heavy soils, but as we pointed out last season the water penetration on these particular soils is shallow at best, and if enough soaking is indulged in to finally fill the sub-soil, the surface soil will have been waterlogged and cold for an injurious length of time. We do not necessarily recommend the use of any more total water for the season, but merely a different timing of its application.

On the Anderson grove we have attempted no modification of the irrigation practice but have made a study of the moisture conditions that actually occur under ordinary conditions on the loam soil. Two ten-acre blocks have been studied, one of which has been given clean cultivation throughout the summer and the other of which has grown a summer covercrop of Black-eye beans. The dates of the five irrigations and the one rain on the clean cultivated grove have been (using the middle day of a thereto five-day run): April 12, May 20 (rain), June 5, June 25, July 22, August 26. From three to three and one-half acre inches of water have been applied per acre each irrigation. Our moisture determinations, taken at weekly intervals, indicate clearly that under the conditions represented the soil to a depth of four feet has reached the danger point of dryness, particularly just before the July and the August irrigations. At the same time the trees have not put out as regular a growth as might be desired, and there has been considerable actual wilting apparent. Here again a shorter interval between irrigations is indicated; three weeks would seem to be a very desirable period. Just such a change has gradually been made in the Ontrio district during the past few years until a considerable proportion of the groves are on a three-week schedule. We appreciate the many practical obstacles in the way of such a change, but where it can be effected we are sure it will be found advantageous on the type of soil in question and in the hot interior climate.

On the covercropped grove the dates of the seven irrigations and one rain have been: April 2, May 11, May 20 (rain), June 1, June 26, July 14, August 1, August 18. Even with these more frequent irrigations the danger point was reached, particularly before the late June irrigation. (This irrigation had been delayed for about a week because of spraying operations). Towards the end of the season the penetration from the old furrows was very poor—an observation frequently made on this type of soil if the surface has been allowed to bake. On the whole the moisture conditions on this block have been poorer than on the clean cultivated block despite the two extra irrigations. (The amount

Agricultural News Notes of the Pacific Coast

Northern California

All set for the state fair, Sacramento, September 3-11.

Colusa County prune growers have begun picking up prunes.

Trinity County fair will be held September 20-22 at Weaverville.

Butte County orange growers say a big crop is setting on their trees.

The West Side reports smallest grain crop in years has just been harvested.

State highway work on the Trinity river is being done by a bunch of 185 convicts.

Hundreds of hop pickers are busy in the yards of the Wheatland district of Yuba County.

A cooperative livestock sales association for Colusa County is the plan of the farm bureau.

Pear picking is on in Lake County. Sales of drying pears are reported at $45 and $50 per ton.

The California Rice Growers' Association has launched campaign for additional membership.

The olive oil plant at Oroville will again this year be handled by the growers' organization.

Sutter County Peach Growers is conducting a campaign to make it a state wide organization.

The Auburn district of Placer County has already sent out more than 300 cars of deciduous fruits.

Farm Adviser Mark Lee of Alameda County has resigned, resignation to take effect September 1.

A meeting of the California farm bureau will be held at Sacramento during the state fair week.

The Northern California Industrial Exposition was held at Eureka, Humboldt County, August 13 to 19.

The first large sale of prunes reported in Colusa County was a 200 ton lot sold on a basis of 16½ cents.

The annual meeting of the Humboldt County farm bureau was held at Eureka during the industrial exposition.

Cuts in gas rates of from 2 to 8 cents per 1000 cubic feet have been ordered by the railroad commission to take effect August 15.

The St. Helena Vintage festival will feature a big parade on Labor Day, September 3. This will also be American Legion Day.

The Eden Township Farm Products Show held at Hayward, Alameda County, last week was one of the most successful ever held.

Miss Clark has been demonstrating the use of home evaporators in Placer County. Poultry culling demonstrations will be given August 29 by R. B. Eason.

The short courses at the university farm at Davis: Poultry husbandry, September 26-November 5; animal husbandry, October 17-28; dairy manufactures, February 6-16, 1922; deciduous fruits, November 8-December 10; general agriculture, January 2-7, 1922.

At what is said to have been the largest gathering of Shasta County stockmen ever held in Redding it was decided to join in cooperative marketing of stock. Committee in charge of the project: Fred Max, W. J. Albaugh, James Barry, Charles A. Hufford, Jos. R. Hunt.

Central California

Effort is being made at Turlock to reorganize the sweet potato growers.

Packing and shipping of green peaches closed in Kings County the last week of August.

Lindsay, Tulare County, claims to be the center of the pomegranate industry of the United States.

The Boys' Agricultural Club of the Lake district school, Santa Cruz County, staged a poultry show last week.

The Ceres Courier protests arrests of farmers driving produce into Modesto for not having city truck licenses.

Patterson, Stanislaus County, has voted down an ordinance passed by city trustees closing movies and pool rooms on Sunday.

The newly organized Pomegranate Growers' Association of Tulare County is investigating by-products of the fruit, particularly dyes.

The Modesto and Turlock irrigation districts report that practically all rights of way are now secured about the Don Pedro dam site.

Eastern buyers of apples are in evidence in the Pajaro Valley making purchases for future delivery on Atlantic Coast and English markets.

Reedley chamber of commerce has subscribed $12,500 towards a home building campaign, to be put on in the various towns in the Valley.

The Tulare Cooperative Poultry Association sold over $4,000 worth of live poultry during July. The total month's business amounted to $15,000.

Travel to Yosemite has been heavy. 1,297 autos entered the park from August 1-10. Attendance for the season is now estimated at 85,000.

The Fresno district fair announces that prices this year will be reduced to pre-war levels. General gate admission, every day except Saturday, will be 50 cents for adults and 25 cents for children.

San Joaquin Valley Communities met at Fresno on Monday, August 22, appointing a committee to confer with the city of Los Angeles representatives on equitable development of power sites on the Kings river.

The Watsonville Women's Club is planning for an autumn festival to be held some time in October for the benefit of the children's playground. The festival will take the form of the old fashioned county fair.

The formation of the Consolidated irrigation district has been voted. The new district is part of the Pine Flat Reservoir project, which is intended to impound 600,000 acre-feet of flood waters of the Kings river.

Close to 50,000 persons have visited General Grant and Sequoia National Parks up to August 15, or 10,000 less the total attendance last year. Nearly 11,000 automobiles have paid toll so far this season.

Officials of the Associated Raisin Company have been in the Kerman district making survey of the raisin crop. It is probable that the capacity of the packing house at Biola will be overtaxed and that considerable tonnage will be taken to Kerman where a grader will be installed in the alfalfa mill.

Southern California

Blackeye beans are being harvested in Orange County. The largest crop ever is promised.

Air patrols over the national forests are being sent out daily from March Field near Riverside.

A wild west show, called the "Sierra Stampede," will be staged at Hemet, Riverside County, September 5-6.

A general exhibit of agricultural products will be made at the Escondido Grape Festival on September 9.

R. S. Woglum says good work is being done by the aphycus in controlling black scale in some orchards in Covina.

Pasadena men have formed a company to mine marl lime deposits in the hills north of San Dimas, Los Angeles County.

At the annual meeting of the California Lima Bean Growers Association all officers and directors were reelected.

Riverside County supervisors are considering adoption of truck ordinance recently passed by San Bernardino County.

Home Demonstration Agent Mrs. Woodworth of Riverside County has been giving demonstrations of home-drying of figs.

The Riverside County Beemen's Association is making attractive exhibit at the state fair, Sacramento, the coming week.

The California Lima Bean Growers Association has disposed of 98 per cent of its 1920 crop of Limas, 55 to 60 per cent of Baby Limas.

A Los Angeles man has invented a machine which he claims will dig and top beets at a considerable reduction over present costs.

An orange by-products factory at San Dimas, Los Angeles County, shipped a carload of grasshopper poison to Nebraska last week.

Wireworms and low prices have caused many Ventura County bean fields of years standing to be planted to bell peppers and winter peas.

A heavy storm, almost a cloudburst, occurred, in the San Jacinto Mountains last week. Not enough rain fell in the valleys to damage drying fruit or hay.

Fires have been burning on Pine Mountain, Santa Barbara County, for three weeks. Fire fighters have been having a strenuous time in many sections of Santa Barbara County.

Petitions are being circulated asking the state to make survey of the San Jacinto watershed. Statistics are also being collected of wells, pumps, etc., used in the San Jacinto Valley.

President Teague of the California Fruit Growers Exchange has returned from Washington, and expresses belief that the 2-cent lemon tariff will stand and a 4-cent tariff be put on walnuts.

Dr. H. J. Webber, formerly in charge of the citrus experiment station at Riverside, and recently engaged in agricultural work at Hartsville, South Carolina, has been appointed professor of citriculture and director of the citrus experiment station. Dr. Webber will assume his new work about the middle of October.

The Coast and General

The Arizona state fair for 1921 has been called off.

Pendleton, Oregon, holds its tenth annual Round-Up, September 22-24.

Apple districts of Okanogan County, Oregon, report fruit large and developing well.

The early cabbage crop of Northern Colorado is bringing high prices in the Middle West.

The estimated cranberry crop of Washington this year is 50,000 bushels with market value of $250,000.

There is a short apple crop in practically all the states east of the Rockies this year caused by the late frosts.

The report of the Tempe, Arizona, cow testing association for July shows 36 cows testing over 40 pounds fat.

In the July report of the Pima County, Arizona, cow testing association 31 were above the 40 pound mark.

All alfalfa on the Sparks, Nevada, automobile camp grounds has been cut and burned to prevent spread of alfalfa weevil.

The Mesilla Valley Fruit Association of New Mexico has adopted strict picking, grading and packing regulations for the pear crop.

Summer pruning of apple trees is reported to have shown very satisfactory results at the experiment station at Moscow, Idaho.

The Inland Empire Dairy Producers' Association, with headquarters at Spokane, has a membership of 500 owning nearly 3,000 cows.

Farmers of the Mason Valley of Nevada are expending $1,000,000 in diversion of forks of the Walker river into irrigation channels.

The cantaloupe growers of Mesilla Valley of New Mexico are making a fight for reasonable freight rates from Las Cruces to New England points.

The Pacific Cooperative Poultry Association has been organized with headquarters at Portland. Membership is in both Oregon and Washington.

Michigan canners have paid nine cents a pound for Morello cherries. Eighty per cent of the crop of the Grand Traverse section went to the local canneries.

Oregon has a law prohibiting any concern from selling a butter substitute if its firm name implies it is a dairy plant. Thus a "creamery" may not sell oleomargarine.

At the annual meeting of the Arizona farm bureau held at Flagstaff, C. S. Brown was elected president; Dougal Stewart, secretary; executive committee, Fred Tait, Phoenix; Geo. Kinne, Casa Grande; P. C. Merrill, Pima.

The intermountain region shows prospects for an average crop of honey, with decided variations in certain sections. In eastern Oregon and southwestern Idaho the flow did not commence until July 20 and the outlook is for not over half a crop.

The loganberry crop of the Willamette Valley of Oregon is estimated at 10,600,000 pounds as against 7,800,000 pounds last year. Average price around 3¼ cents; last year, 13 cents; 1919, 9 cents; 1918, 5 cents; 1917, 3½ cents; 1916, 3 cents; 1915, 1¾ cents.

The Vegetable Garden in September

Northern California

By A. R. Gould

OUR planting list will be getting shorter as we get into the fall months, and the nights will be getting colder, hence only the more hardy crops may be put in. Continue to collect all crops as they mature and as the plots are cleared they should be well manured and limed if necessary, after which they should be deeply dug. Get them in order for planting with winter crops. The plot you used this season for carrots you can follow up with peas, and the bean plot you may use for lettuce. Keep up a steady rotation of crops, and the practice of changing them around will become a habit with you and a profitable one. There will be less trouble from pests, and this means much to every grower. Store all root crops in the cellar for winter use, but remove any even slightly diseased.

Tomatoes

There should now be heavy crops on these, and there will no doubt be a surplus to can. Towards the end of the month green fruits may be picked and placed in the house to ripen. Destroy all diseased fruits, as they become a menace in the garden.

Potatoes

Digging this crop should ere this have been completed and the tubers placed in storage for the winter. They should be examined frequently and all diseased tubers removed.

Muskmelons, Watermelons, etc.

It is a good plan to protect the fruit by placing a thin piece of board under it to keep it from rotting, which it is liable to do at times through excessive moisture.

Beans

Collect all shell beans and keep in a dry place. Broad Windsor beans may now be sown in rows two feet apart, placing the beans two inches apart in the row. These make an excellent table bean and come in early in the season. They deserve to be more widely grown.

Lettuce

Thin out Los Angeles and May King varieties sown last month, leaving them spaced 18 to 24 inches apart to allow proper development. Give these plenty of water and cultivate frequently. Extend the plot by planting out an extra row or two of the seedlings thinned out, using the strongest plants.

Leeks and Celery

Continue to assist these valuable winter crops by frequent applications of manure water. Careful watch must be kept for slugs which are especially fond of celery.

Cabbage

Sow Savoy and Autumn King now for winter use on well prepared seedbeds. Broadcast very thinly.

Corn

The corn worm will be busy just now, and it will be necessary to keep dusting the silks of the ears with lead arsenate. Cultivate and irrigate between the rows of the sowing made last month.

Parsnips

Sow the variety Hollow Crown in rows two feet apart. Sow the seed thinly in well prepared ground.

Carrots

Sow Danvers Half Long in rich soil in rows 18 to 20 inches apart.

Beets

On richly manured ground sow Early Egyptian in rows 20 inches apart. A sowing of Sea Kale beet or Swiss Chard may also be made now. This is excellent used as spinach.

Strawberries

It will be an opportune time to replant the strawberry plots with the young plants now getting established near the parent plants on the old plots. For the best results the soil must be well trenched with farmyard manure. Keep the plants well watered and cultivated and plant at least 16 inches apart in the rows. To allow plenty of space for cultivating the rows should be 30 inches apart.

Southern California

By D. F. Reichard

ADVICE was given last month to get ground ready for the fall planting; how to get the soil thoroughly wet and how to leave a deeply worked, finely pulverized seedbed. If this was not done last month it should be done as soon as possible this month, for unless the seeds are in the ground by the last of September the produce will not be ready to harvest until well along in the spring. What we are aiming at now is to have vegetables for winter.

In warm sections sweet corn may be planted during the early part of the month; it will be ready for use during the Holidays. Canadian and Ventura Wonder beans will be ready to pick eight to ten weeks from planting, according to how early during the month they are put in; the later they are put in, the cooler the weather, therefore slower development. Do not plant pole beans, squash, cucumbers or pepper, tomato or eggplant unless you are in an absolutely frostless location. If you have such a spot and wish to try any of these tender vegetables, put them in during the first of the month so that they will get as much growth as possible before the long cool nights come.

The main plantings for September are, however, the more hardy varieties like beets, carrots, turnips, endive, kohlrabi, onions, parsley, parsnips and spinach, all of which should be planted in rows where it is to grow and thinned out to four to six inches.

Lettuce, kale and Swiss chard are also sown in rows and thinned out, but the plants are left much farther apart and the plants taken up when thinning may be transplanted.

Plant Laxtonian and Senator Peas. Drop the seed in the bottom of a five inch furrow and cover about two inches with damp dirt, then as the peas grow gradually fill in the furrow. Cabbage, cauliflower and Brussels sprouts may be set out now for early crops or seed may be sown for later crops. The main plantings of cabbage are made in September for plants to be set in November for spring cabbage.

Where spring crops have matured clean up the old plants, burning those that show disease and composting or plowing under the others. Make arrangement for manure of some kind to spread over the garden a little later to be plowed in during the winter.

Southern Arizona

By M. E. Bemis

REAL gardening activity in the irrigated valleys of southern Arizona begins in earnest in September. Preparation work, such as heavy manuring, keeping weeds down, and plowing, should have been done earlier, and if so there is nothing to prevent going ahead with the planting of such things as are on the calendar for September. The list of plantable things is: beans, beets, cabbage, cauliflower, kohi rabi, kale, lettuce, onion seed, onion sets, peas, radishes, spinach and turnips.

In the Salt River Valley beans are planted up to September 15, in the Casa Grande and Santa Cruz Valleys not quite so late, and in the Yuma Valley somewhat later. The Kentucky Wonder, Wonder Wax, Broad Windsor, and White Seeded Kentucky Wonder have been found to do well. Bush varieties that are satisfactory are the Stringless Green Pod, Black Wax and Improved Golden Wax. In Limas the large Lima and Burpee's Bush are good. Beans ordinarily will mature in from six to eight weeks, so if the usual date of early frosts is known one may figure about the right date for planting.

Some small seeds are slow to mature

(Continued on Page 236)

The Ornamental Garden in September

Southern California

By Ernest Braunton

SEPTEMBER is the first real planting month since early springtime and is a very important one in California gardens. In the cold eastern states it is a time to get ready for dormancy or semi-hibernation; but here it is get ready for the exuberant life of the sub-tropical rainy season, erroneously called winter.

The finest commercial sweet pea crop the writer ever saw was from sowings made September 15 and October 1. They are a cool weather crop, especially in the warmer parts of the state, and September is the time for the first sowing. Pansy seed should go in now, and first in annual bedders should come the "Fairy Primrose," Primula malacoides, the best and most continuous blooming small plant we have for the cool rainy season. In either bed or border it blooms for several months.

Cineraria, candytuft, forget-me-not, mignonette, calendula, columbine, all are cool weather plants. Another fine flower is the dwarf annual orange colored daisy from Africa, Dimorphotheca aurantiaca. We hope it will eventually live down its terrifying name for it is a beautiful flower which is in its best bloom when flowers are most scarce. Let's call it African orange daisy. Cosmos is another good thing for winter, with stevia and gypsophila for floral frailties to mix with the larger and coarser flowers. Other seeds for September are: Centaurea, columbine, coreopsis, phlox, scabiosa and stock.

Bulbs

This is the first bulb month. Freesia and Watsonia should go in first and common, or German iris is in prime season; plant or transplant now. Other bulbs for present planting are: Anemone, amaryllis, calla, crocus, cyclamen, hyacinth, iris (all kinds, ranunculus and tulip.

Next month is a better time for the general planting of bulbs, but now is the time to prepare the soil. Work in plenty of well decomposed stable manure and work it in deeply, turning the soil over several times. Bulbs do best, generally, in a light soil. This is partially due to the better drainage afforded, so dig deeply.

If you wish to buy plants to set out, you should be able to get: Canterbury bell, centaurea, columbine, Sweet William, salpiglossis, snapdragon and the perennial and biennial bedders, such as foxglove, phlox, penstemon and the hardy herbaceous plants common in eastern gardens. This is also a time for autumn lawn making.

Nurserymen consider September the golden time for moving plants. Palms and other balled plants are taken up now and stored in sand or sawdust in lath houses. Therefore it is an excellent time to move palms. Sufficient warm weather will yet come to heal roots and allow plants to adjust themselves before winter's rest.

Northern California

By A. R. Gould

THE season is getting well advanced now and our fall flowers will be at their best. Those who kept up a succession will have flowers well on toward Christmas. A successional supply is something to strive after and may be secured by later sowings. It

MAKE TWICE SURE THAT YOU HAVE THE GOPHER

First: Set a Double Catch Gopher Trap.
Second: Have a look at the dead Gopher.

If you use the Double Catch Trap you will have the satisfaction of knowing that the rodent will never bother you again. It takes a lot of feed to board a gopher for a year and that is but a small part of the expense. The loss of a tree worth $50 or more is often the result of failing to get the gopher when you go after it.

This Trap Is Automatically Set for Old or Young Gophers.

READ THIS LETTER

Enclosed is my check for $3.00 for which I would ask you to send me four more gopher traps. It might be of some interest to you to know that this is the only trap we have ever had that would really catch gophers. My man reports that he has caught more gophers with the first four traps than with all the traps and poisons he has put out in the past year that he has been in my service.—Frank A. Guernsey, Manager, Sacramento-San Joaquin Bank, Stockton, Calif.

The demand at this time of the year is as great as ever. If you cannot secure Double Catch Traps from your local Seed stores or Hardware dealers, send direct to us. Price, postpaid, 75c; one dozen $7.50. Money returned if not satisfied.

Apple Packing and Inspection Regulations

By F. W. Read

BOXES of packed apples shall not be stamped with the state grade designation containing the legend "Inspected under the California Standard Apple Act" unless the contents have been examined by a duly authorized state inspector or unless the lot is one of a unit of like containers so inspected.

Marking on Packing Boxes

The following markings are required on all packed boxes of apples when offered for shipment: Name and address of packer. Grade of fruit. Date of packing. Variety of fruit if known —otherwise "variety unknown." Number of apples in box, or net weight. If other than Standard Box is used: "Irregular Container" in letters not less than one-half inch in height.

If tier markings are employed in preference to number of apples in box, tier markings should correspond to the diameter indicated: 3½ tier, larger than 3⅛ inches. 4 tier, larger than 2⅝ inches but not to exceed 3⅛ inches. 4½ tier, from 2¼ to2⅝ inches inclusive. 5 tier, from 1⅞ to 2¼ inches, inclusive.

If more than 5 per cent of the stock is below size requirements, repacking will be required.

Freedom from Dirt

The grade requirements for both "California Fancy" and "B" grade include the statement "Virtually free from dirt." In years past this requirement has not been rigidly enforced, to the detriment of the quality of the fruit in certain of the commercial districts of the state. For that reason "virtually free from dirt" will be interpreted hereafter to mean clean apples. Under this regulation all apples smeared with aphis honey dew and subsequent smut fungus infection shall be packed in "C" grade. Dirt usually adheres to the olly surface of apples following rains, and such stock will be classified as "B" grade or "C" grade, dependent on the degree of such rain injury. It is recommended, therefore, that growers and packers endeavor to harvest the crop as early as proper maturity will permit.

Russeting

Inasmuch as apples from the Watsonville district are characteristically russeted to a greater or lesser degree, dependent upon seasonal and weather conditions, a reasonable amount of russet will be permitted in the "California Fancy" in the fruit packed in this district. Apples russeted to the extent of "frogging," cracking or excessive roughening will not be permitted under any condition in the "California Fancy" grade.

Definition of "Well Packed"

The term "well packed" mentioned in section 2, subsection (b) and (c) of the California Standard Apple Act, as one of the requirements for "Califor Fancy" and "B" grades, is hereby defined as follows:

"Well packed" shall mean that the box is sufficiently filled to prevent the movement of the fruit in the container and that the top and bottom show a bulge of about one-half to three-fourths of an inch each.

If wrappers are used throughout the container, the apples in all layers except the bottom layer must be wrapped as defined below; the bottom layer may be "flagged."

"Wrap," "wrapping" or "wrapped" shall mean the complete surrounding of the fruit by wrapping material.

"Flagging" shall mean the incomplete or partial covering of the fruit, accomplished by placing fruit in the wrapping material without attempt to close the wapper.

It is recommended that new clean Standard boxes be used for packing "California Fancy" grade apples and that packing house managers cause their packers to be numbered, the number being placed on each box for identification purposes.

Other Defects

In addition to the regulations established above on russeting, no apples shall be packed or designated as "California Fancy" showing any blemishes, scars, limb rubs, bruises, except those caused in the process of proper packing, caterpillar bites, apparent water core or frost injury.

Tolerance

The total tolerance of defects permitted is ten per cent, with five per cent of any one defect.

Certificates at Team Track

Certificates will not be issued on mixed cars loaded on team track unless the local inspection office has been given sufficient notice in advance of actual loading.

Loose Apples

In no case will loose apples be permitted to move if they do not at least meet the requirements of "C" grade. Inspection of such apples will be necessary and under the authority granted the director of agriculture in section 7, subsection (g), a charge of one-half cent per loose box will be imposed for such inspection service.

Copies of the California standard apple act may be obtained on request from State Department of Agriculture, Sacramento.

PRUNE PRICES RAISED

Prices on all sizes of 1921 pack prunes from 30-40's to 60-70's inclusive have been advanced one-quarter of a cent by the California Prune and Apricot Growers, Inc., according to announcement given out by Manager Coykendall.

Today's advance carried out prediction made less than two weeks ago by association officials in naming the first formal prices for 1921 pack prunes, that any change from the prices quoted at that time would be to a higher level.

The new prices named by the association for 1921 pack are: Sunsweet Quality, 30-40's, 9¼ cents bulk basis; 40-50's, 8¼ cents bulk basis; 50-60's, 6¾ cents bulk basis; 60-70's, 6¼ cents bulk basis. Though no prices have been announced on 20-30 prunes by the association, prices being quoted in the trade are 25 cents a pound flat packed in 25 pound boxes f. o. b. California common shipping points.

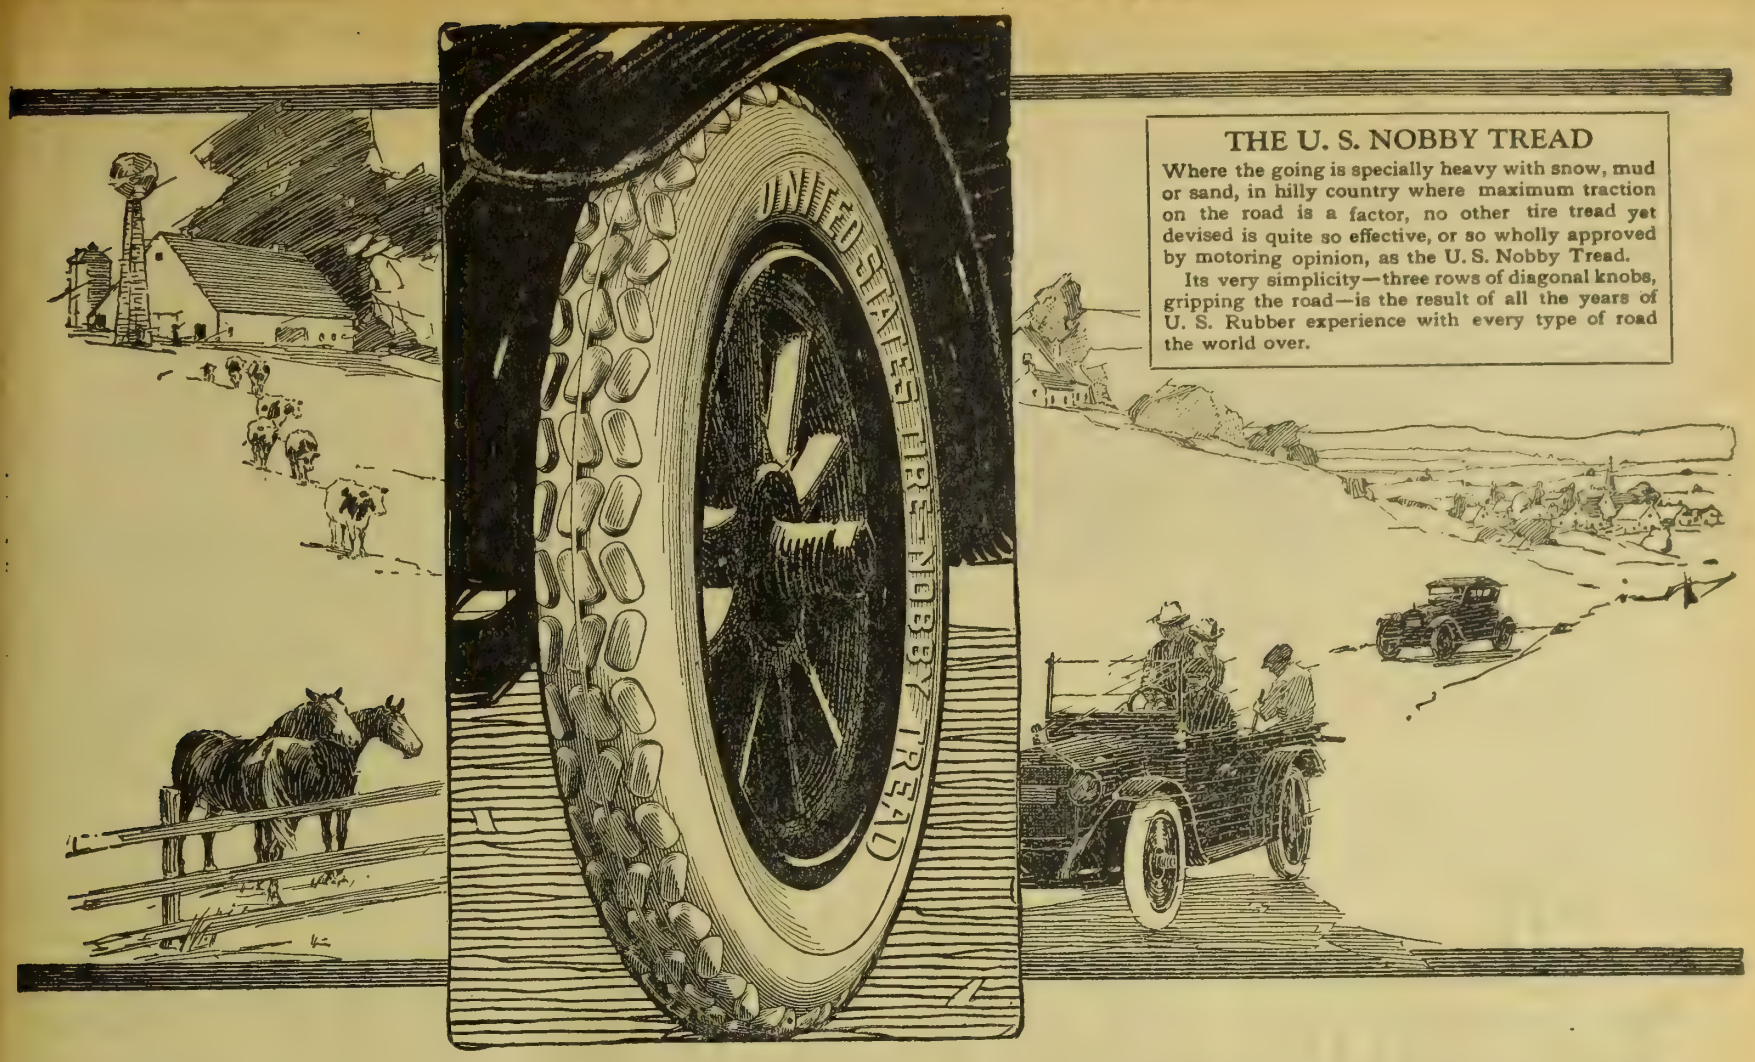
Prices for Growers Brand prunes were also boosted by the association one-quarter of a cent a pound on all sizes 30-40's to 60-70's inclusive. Prices on all sizes of Growers Brand prunes are one-quarter of a cent less than prices quoted for Sunsweet quality.

Association officials announce that they have made a very satisfactory booking of orders for 1921 pack prunes and have on hand sufficient orders to practically clean up the heavy stocks of 1920 holdover now stored in their packing houses throughout the state. Shipping of holdover is being speeded as fast as possible and all stocks of 1920 prunes will probably have been shipped out by the middle of October.

ORANGE COUNTY FAIR

The greatest collection of Orange County farm products ever gathered together is expected to be on exhibition when the fifth annual Orange County fair opens at Huntington Beach for four days. The dates are September 28-October 1. Two large tents, each 100 by 220, will house the agricultural and horticultural displays, and three other tents will contain the automobile, poultry and entertainment departments.

The Orange County farm bureau is taking a great interest in the products exposition, hailed as the "$90,000,000 products show" in honor of Orange County's marvelous production record, and many of its 1,100 members will be represented with exhibits, individually and collectively. The community exhibits department has always excited keen competition, and this year will be no exception for each of the 15 local centers has a committee at work preparing for their community's exhibit at the fair. Cash prizes offered by the committee and the Huntington Beach News in this department are: $125, $65, $35, $15 and $10.



THE U. S. NOBBY TREAD

Where the going is specially heavy with snow, mud or sand, in hilly country where maximum traction on the road is a factor, no other tire tread yet devised is quite so effective, or so wholly approved by motoring opinion, as the U. S. Nobby Tread.

Its very simplicity—three rows of diagonal knobs, gripping the road—is the result of all the years of U. S. Rubber experience with every type of road the world over.

Who can tell a good tire just by *looking* at it? How much do you depend on your dealer's recommendation? Who *is* your dealer? Are the makers of the tires he sells as responsible to *him* as you expect him to be to *you?*

Know the tire you buy, and the dealer who sells it to you. Spend your tire money for assured values. There is everything to gain in a fair and square tire purchase. Get the returns in economy and service you're entitled to.

The U. S. Dealer is a responsible merchant. Buy a U. S. Tire and you get tire satisfaction every time. A brand new tire of fresh, live rubber. A tire with a reputation and nothing to hide. Built and sold on the U. S. basis of quality and conscientious service.

SEPTEMBER IN THE ORNAMENTAL GARDEN IN NORTHERN CALIFORNIA

(Continued from Page 233)

will soon be time to plan for next season's planting and many new ideas may be worked out. Certain shrubs may require moving and those portions of the garden which have become overcrowded will probably need attention. To those who have only a limited space to garden in we would advise very careful selection. Have the plants you love best, as they will give you lasting satisfaction and you will have no regrets. Old fashioned plants like lavender, rosemary, foxglove, Sweet William, mignonette, heliotrope, candytuft, roses and violets help to make up a garden of old time memories. Keep them in mind.

Freesias

This fragrant flower should be planted freely, as it may be used as a cut flower so advantageously. If planted near the walks it is very effective. There are now some wonderful hybrid strains in colors of orange, lavender, mauve, etc. The deep yellow Barr's is also a fine type and Purity is a good white.

Tulips, Hyacinths, etc.

Selections should now be complete and orders given to your seedsman without delay to secure the best bulbs. The Darwin tulips; Europe, Clara Butt, Pride of Haarlem, and Rev. Eubank are all good varieties and will be valuable as cut flowers in April and May. Hyacinths may be obtained in various colors and provide an early display.

Daffodils or Narcissi

For naturalistic or border planting these are unequaled and they may be planted on banks or in woodland places. The best for this scheme are Emperor, Empress, Golden Spur and Poeticus.

Flowers for Early Spring

Violas, pansies, stocks, forget-me-nots, Sweet Williams, snapdragons and English daisy, many of which we advised sowing last month, should soon be ready to transplant into well prepared frames. The seedlings must be shaded from the sun and lath covers will be found useful for this purpose.

Chrysanthemums

These will need feeding with liquid manure once a week at least, if quality flowers are required, and where the large Japanese type is being grown the terminal bud will soon be developing and side buds must be removed. The smaller single and pom-pom types are the most useful from a decorative standpoint. They make an effective display either in the border or as a cut flower and are easily propagated by cuttings or subdivision of the roots.

Hollyhocks and Canterbury Bells

These two charming subjects are found in most gardens and can be grouped in any border. To secure hardy plants for next season's bloom, seed should be sown now. Hollyhocks come in double rose, yellow, red, white and maroon, and they may also be seen in single fringed types. Canterbury Bells come in blue, white and pink, single and semi-double. Sow in sandy soil.

Sweet Peas

Winter flowering varieties should be sown without delay. The trenches should be well prepared.

Flowering Shrubs

After these have flowered they need some little pruning and many will be better for having the dead flowers removed, of which the hydrangea is an example. Any old dead wood must be removed and those shrubs affected by scale or aphis must be sprayed.

Thalictrum Dipterocarpum

This fine perennial has fern like foliage and beautiful lavender flowers and is in bloom for several months. It is now getting very popular and should be planted in the border.

VEGETABLE GARDENING IN ARIZONA

(Continued from Page 233)

while the days are still warm, although cool nights are conducive to germination. Some practice planting on the north side of ridges running east and west. This gives just a little shade and seems to help germination. Grasshoppers are sometimes a menace to early planted gardens. The only practical means of combating these pests is with poisoned bran mash.

Several varieties of beets do well; in fact, most of the common sorts are all right. Frequent cultivation is said to prevent the woody characteristic which spoils a beet for table use. Swiss chard is being grown considerably for poultry. Mangel wurtzels are also grown and should be more extensively. I find that some grow two crops a year, the principal use being for poultry, although as a stock food they are excellent. No doubt there are many small farms that might grow a heavy tonnage for dairy cows and would thus have provided a succulent food without the expense of a silo. The fall crop may be planted at this season the same as table beets.

Cabbage plants may be put out this month, but it is better to get the ground in ideal shape and put them out next month. Cabbage does well and may in time, if freight rates permit, become a commercial shipping crop.

Lettuce is the leading commercial winter truck crop in the Salt River Valley. There are many failures, however. It is not always easy to find a reason for some failures, but in the main, thorough preparation, very heavy manuring and careful planting will insure success, provided that insects and rabbits are kept out. The New York Market is undoubtedly the best variety for shipping and is also a good variety for local consumption. The Harvey House service uses large quantities of Arizona lettuce during the season from January to April when it is available. Arizona Wonderful is an improved variety which is preferred by some.

Onions for transplanting should be planted in September. For main crop in rows where they are to grow it is better to wait until October. Onions are difficult to grow in hot weather, hence beds planted in September should be shaded.

Early varieties of garden peas may be planted now.

Spinach is one of the plants which have commercial possibilities. A considerable quantity is shipped out from the Salt River Valley by express, and quite likely with the proper development carlot shipments may become as extensive as carlot shipments of lettuce.

DRIED FRUITS IN DEMAND

That the tide has turned for the fruit growers of California, that confidence has been restored in commercial circles and pessimism has been supplanted by optimism is indicated by the announcement of the California Peach and Fig Growers that the 1920 crops of both peaches and figs have been disposed of and buying activity has made it necessary to withdraw from the market on five grades of peaches.

In making the announcement the association officials state that during the past 60 days increased buying has featured the dried fruit market, not only in this country but in Europe as well. As a result the association, which markets over 80 per cent of the dried peaches and figs grown in the state, has disposed of all carry-over fruit.

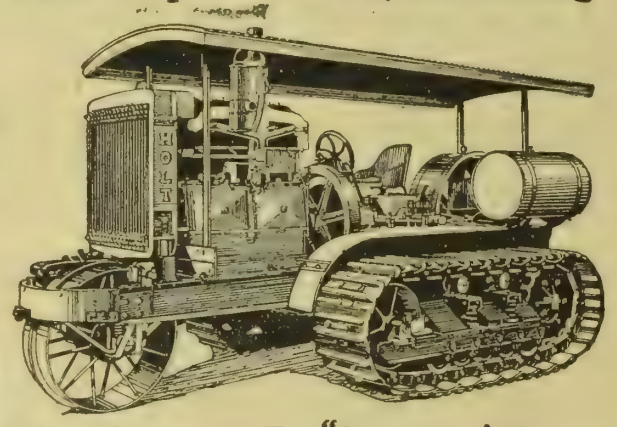
In announcing the association's withdrawal from the market on certain grades, it is stated that the prospects of a light crop and heavy buying in the past few weeks make the move necessary. The grades withdrawn are

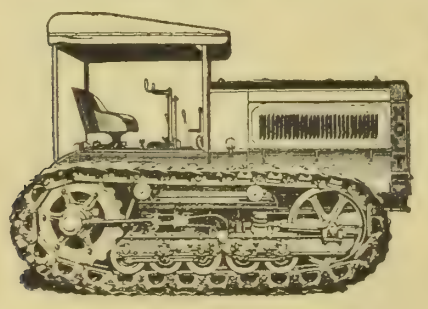
The entire NEW line of "CATERPILLAR" TRACTORS

will be exhibited for the first time in the Holt display at the California State Fair Sept. 3 to 11, including—

The NEW "Caterpillar" 75 Tractor

now offered for the first time to those who want BIG POWER, combined with a degree of dependability, economy and long life never before reached.



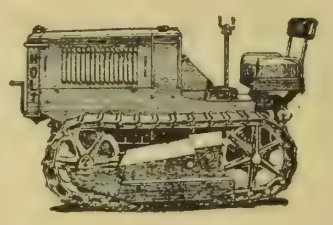


The Western 10-Ton "Caterpillar" Tractor

(shown at the left) 60-belt and 38-drawbar horsepower. This model was first announced only a few months ago, and is another important contribution to better, cheaper farming.

The NEW Little T35 "Caterpillar" Tractor

(shown at the right) now announced and shown for the first time—the supreme small tractor, with every feature of Holt dependability, long life, power and economy compacted into extremely small size. This newest development of Holt unequaled experience will prove to be the tractor sensation of the decade.



The Holt exhibit will also include "Caterpillar" Disc and Moldboard Plows, Subsoilers, Land Levelers, Stationary Power Units and Combined Harvesters, also "Caterpillar" 45 and 5-Ton Tractors.

The new machines in the "Caterpillar" line are offered at pre-war prices conforming with the price reductions recently announced.

Don't miss the exhibit at the State Fair. This offers the first and best opportunity to see these newest achievements of the world-famous "Caterpillar" line

Aggeler & Musser Seed Company
620 So. Spring Los Angeles, Cal.

Fancy Muirs, Extra Fancy Muirs, Fancy Yellows, Extra Fancy Yellows and Standard Yellows. General Sales Manager A. J. Sturtevant, Jr., commenting on the situation, says:

"We are withdrawing certain grades of dried peaches because we do not dare sell more at this time. Heavy sales and uncertainty in the matter of tonnage in these grades make this move imperative. It is our belief that these grades for 1921 fruit are practically cleaned out.

"With no carry-over of peaches and figs and with the prospects of a light crop ahead of us here on the coast, we anticipate that the 1921 season will see an early close out. With a shortage of peach crops in the East and Middle West and foreign fig production extremely low in prospect, California should experience a revival in these lines this fall."

ALMOND TARIFF FIGHT DELAYED

Manager T. C. Tucker of the California Almond Growers Exchange writes:

"Submission to the senate finance committee of California almond growers' demands for a five and 15 cent protective duty on unshelled and shelled almonds, developments in Washington has delayed tariff legislation, necessitating extension over several months of our fight for continued existence of the state's almond growing industry. Resumption of the struggle in the senate and before the conference committee of both houses will finally determine provisions of the Fordney bill. We take this opportunity to thank you on behalf of our 4,000 members for the assistance you have given them. Our battle will not be won until the tariff bill is signed by the president."

CONTROL OF NEMATODES

Because of the serious problem confronting many sections in control of the nematode pest, we give the following recommendations contained in a recent bulletin of the Florida experiment station:

For the general farmer and trucker with plenty of land the cheapest method of treating nematode infested land is to grow on it immune or resistant crops for three years.

For truckers with limited acreage who cannot spare the land long enough for the starvation method the number of nematodes can be reduced greatly by growing during the summer resistant or immune cover crops in rows which can be constantly cultivated; or by summer fallowing, if loss of soil fertility is of minor importance; or by applying fresh cyanamid at the rate of a ton to the acre a month or two before the land is to be planted; or by flooding the land with water for a week or two.

For seedbeds plant on newly cleared land; or treat the land with sodium cyanide at the rate of 600 to 800 pounds and with ammonia sulphate at the rate of 900 to 1,200 pounds to the acre. This is too expensive for a large acreage.

For the small home garden combine fallowing with the yarding of chickens.

For growing perennial plants plant on newly cleared land; mulch heavily and do not cultivate; water well; for figs, plant near a building; for peaches, graft on plum roots.

Be sure that the seedbed is free from nematodes. Do not set out in nematode free land plants from a seedbed showing any trace of nematodes.

Thoroughly clean all dirt from plows and other tools before taking them into a nematode free field.

Take the same precautions with horses' feet and workmen's shoes.

Do not allow water to wash soil from an infested field over an uninfested one.

A NEW PEACH

New varieties of peaches and other fruits are constantly being grown from seeds for the mere enjoyment of seeing what one will get. One such variety came to the Cultivator office last week, grown by a little chap who planted the seed "for the fun of seeing what would grow." The fruits are of exceptionally good size, form, color and flavor; flesh firm, not fibrous, seeds small. Tree robust and a heavy bearer. The boy is so elated that he will call it "Lloyd," for that's his name.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Mildew of Grapes

I have several Delaware, Thompson and Muscat vines, all trellised on an arbor, nicely pruned and trained. They did well, fruiting up to July 15, when the leaves commenced to wither and fall. The fruit, then about the size of peas, stopped growing, dried up and fell off. This occurred only on the Thompsons and Muscats. The Concords were not affected and are now ripening. They are all on the same arbor about eight feet apart. What is cause and remedy?—Subscriber, Pomona.

Without being able to investigate these vines it would be our guess that the Muscats and Thompsons are suffering from ordinary mildew. If such is the case your crop can probably be saved next year by thorough applications of sulphur at frequent intervals during the spring and early summer. —F. K. H.

Bean Straw for Fertilizer

I have planted Blackeye beans between my six year old oranges and walnuts, four rows of beans between tree rows. How can I get most profit from them; let them get ripe and harvest, using the straw for bedding, make manure out of it and haul it back into the orchard and sell the beans for about $3.50 per hundredweight, after paying for threshing, etc., or plow or disk them into the ground while green? How ripe should the beans be before they should be plowed or disked under?—Subscriber, Puente.

The most economical use of bean straw is as bedding or feed. Practically 80 per cent of the fertilizing value of bean straw remains after feeding provided care has been used in saving all stable waste. Besides this it is an excellent absorbent of the liquid portion of the manure, which is far richer in nitrogen than the solids.

Bedbugs

I am a subscriber of your paper and learn so much good from it. How can I get rid of bedbugs so they won't come back?—Subscriber, Paso Robles.

Pour boiling water or hot water containing corrosive sublimate into the cracks where they hide. A daily campaign with gasoline is also helpful. In case they are firmly entrenched and refuse to yield to this treatment then fumigate thoroughly with hydrocyanic acid gas. Close all cracks and openings. Use 1 ounce of cyanide of sodium for every 100 cubic feet to be treated. To this add water, 2 fluid ounces, and sulphuric acid, 1½ fluid ounces. These chemicals must not be put together until one is ready to leave the room and close the house tightly. In fact, these chemicals should be used only by those who understand their use and their deadly nature. One full breath of the pure gas is almost sure death. For particular instructions in fumigating buildings one should see California Cultivator of September 11, 1913, page 246. This number is out of print and we are unable to mail copies.

Alkali Salts

Can you tell me what is causing my alfalfa to die? Dying plants appear in different parts of the field and gradually spots of considerable area die out. I am sending samples of plants that are in different stages of the disease and you will notice that the root appears to rot. This alfalfa has had water about every ten days but I am pretty sure none of it has been scalded, as it made a four to six inch growth after irrigation.—Subscriber, Blythe.

These plants have no doubt been injured by alkali, just what salt or salts we cannot say, but a close examination of the roots indicates injury by some such agent, and no other trouble is apparent.

Potato Pests

Am sending potato leaves with worms and bugs on them. We have sprayed with nicotine and sulphured, but without relief. The same insects are eating the cantaloupe vines. What should I do?—J. L. V., Buena Park.

Eight distinct species were found on these leaves, not all of which are injurious to potatoes or cantaloupes; some are merely parasitic on other insects. The best one remedy to reach the greatest number would be the 5-5-50 Bordeaux mixture, to which add a half pound of Paris green.

Frog Pond

I have a gumbo 'dobe ranch. The soil holds water almost like cement. In my reservoir it grows a long grass that ducks, fish and most all stock relish. I have an electric pumping plant and I can easily keep a pond of ten acres covered with water. Please tell me whether or not turtles can be grown profitably in such a place. If so, what variety? How large will the largest grow and how long does it require them to develop? What is the best food for them? What do you think can be grown most profitably in such a place? Will Indian Runner duck eggs bring as much as chicken eggs? Are grape seed good duck feed? —Subscriber.

We would guess the turtles would be altogether too deliberate in growth to make them an attractive farm crop. If any of our subscribers have had experience, should be pleased to hear from them. We would suggest, however, that such a ranch might offer a frog growing opportunity. Frogs would require much less time for maturing and we believe stand a chance of proving profitable. Before embarking on such a proposition, however, one should look into the market and if possible make contract for future deliveries. Indian Runner duck eggs will not command the price of ordinary hen's eggs. They are larger and, to many of us, just as acceptable as the best of hen's eggs, but the market always cuts them in price. We have no information regarding grape seed for poultry, but it certainly has some feeding value.

Cucumber Beetles

Large numbers of bugs like those herewith enclosed are eating the young leaves of strawberry plants in this district. We have tried some sprays but without destroying the bugs or discouraging their feeding. Please tell me what they are and what I can do to get rid of them.—M. T., Perkins.

The bugs are Diabrotica Soror, the 12-spotted cucumber beetle. Nothing can be done with them that will not also injure the plants or poison the strawberries so they will be unmarketable. Their eating of the leaves is seldom serious and their season of greatest activity is nearly over. Next year they may not be present in such large numbers.

Melons and Tomatoes

Should tomatoes and melons, especially musk melons, be irrigated after the bloom and fruit sets on? I have been told that water causes the bloom to fall. I am a novice at gardening in California and have been guided solely by the Cultivator articles on gardening.—A. L. M., San Fernando.

As you have been growing, so you must continue to grow. If you have been irrigating throughout the summer you should continue to the end. This will result in a continuation of bearing or a second crop. Melons, both water and musk, also tomatoes, are very deep rooting if left to their own resources and need no irrigation if conditions were good at time of planting. We have known all three crops that had but a quart of water to a hill when set and no more until August. Tomatoes were set as plants; the melons were from seeds planted. The soil had been plowed very nearly a foot deep. The crops were fine. An examination of the root system disclosed roots four feet down in the soil. When irrigated in August both melons and tomatoes produced a good second crop. If the plants are irrigated after setting, the soil settles and packs, air is excluded, the root system remains near the surface and irrigation should continue until frosts kill the plants. The best practice is to stir the soil as deeply as possible and work it well before planting, pulverizing it as finely as possible.

Feijoas and Jujubes

What are the feijoa and the jujube, the countries of their nativity, and will they thrive in Central California? Have they any commercial value?—F. B., Modesto.

Feijoa Sellowiana is a guava, native to Southern Brazil, Paraguay, etc., an evergreen shrub of fine appearance which bears excellent fruits in the budded varieties. Jujube is native to Africa, Asia and Australia. It is in appearance quite like a prune, both green and dried, though not closely related to the prunes or plums, though it may be put to similar uses, but is far richer in flavor and food value. Plants are rare at present and extremely hard to get. Both feijoas and jujubes are hardy throughout California. Jujubes are deciduous; feijoas evergreen. Both fruits are of good commercial value.

Thornless Blackberries

Household Department

MYSELF

I have to live with myself, and so
I want to be fit for myself to know.
I want to be able, as days go by,
Always to look myself straight in the eye;
I don't want to stand, with the setting sun,
And hate myself for the things I've done.

I don't want to keep on a closet shelf
A lot of secrets about myself,
And fool myself, as I come and go,
Into thinking that nobody else will know
The kind of a man I really am;
I don't want to dress up myself in sham.

I want to go out with my head erect,
I want to deserve all men's respect;
But here in the struggle for fame and pelf
I want to be able to like myself.
I don't want to look at myself and know
That I'm bluster and bluff and empty show.

I never can hide myself from me;
I see what others may never see;
I know what others may never know;
I never can fool myself, and so,
Whatever happens, I want to be
Self-respecting and conscience-free.
—Boston Transcript.

WESTGATE'S DOG

By D. H. Talmadge, in Dumb Animals

WESTGATE'S dog was not popular in the neighborhood. He barked considerably in an annoying tone of voice, and he chased cats, and he was inquisitive in the matter of insecurely fastened ice-boxes, and he was what might be termed a blemish upon the landscape, for he had but one eye and one of his ears had been broken, causing a lopsided appearance rather inartistic, inasmuch as it was not uniform with the other ear, which stuck up.

It is to be admitted, however, that this was the only stuck up thing about him. And he was well bred. Westgate had papers to prove this.

Westgate repaid the faith of the dog with faith, occasionally going to an extreme considered by certain of the neighbors as out of keeping with his standing as a lawyer and leading citizen. As, for example, when he attempted in the course of a Sunday afternoon stroll, to call on the Martins at the Dazzle apartments, and the janitor refused to admit the dog.

"Very well," said Westgate, "we'll both stay out."

Explaining the incident later, he said, "Well, you see, it was like this: I couldn't very well go in without admitting tacitly that I was superior to the dog, which I am not. I am a somewhat different order of being, perhaps. But we sprang from the same Creation, and he knows about as many of the real essentials as I do. If there is any truth in the Love is All religion as applied to this existence, and I do not doubt that it is our only hope for salvation, that dog of mine is so much nearer the Great White Throne than is the owner of that apartment house—but shucks! there is another species of beast prohibited there also—children. What's the use?"

All of which is foreign to the story, beyond the fact that it serves after a fashion to introduce Westgate's dog and to throw a bit of illumination upon Westgate.

The Wilkins residence was separated from the Westgate residence by a strip of lawn perhaps 30 feet in width. In other words, three moderate jumps of the dog and three flops of the pendant car and the animal was in foreign territory, so to speak. And, while it was not distinctly hostile territory, it was very near hostile at times.

It came about one night when Wilkins, in company with Westgate and other leading citizens, was down town attending a protracted meeting of some sort, that the dog chased a man to the roof of the Wilkins porch, and when Wilkins and Westgate arrived they found him there, with the dog sitting tensely upon the ground below and with Mrs. Wilkins in a half fainting condition in the front doorway.

Wilkins invited the man down to be killed. Westgate held the dog. The man came down slowly, and started to run, but caught a guttural, rasping sound from behind him and stopped. Wilkins turned on the porch light.

The man grinned. "A friend down the line gave me a bum steer," he explained. "He said they'd killed off all the dogs in this town by order of the city council. Otherwise I wouldn't be here. Believe me, I keep out of doggy towns. I'm afraid of 'em."

"You are a burglar?" asked Wilkins politely, his hands opening and closing convulsively.

"No," replied the man, "I'm a manicurist."

Westgate laughed coldly. "Cut out the humor," he advised. "What were you doing here when the dog discovered you?"

"Nothin'. I hadn't begun yet."

"What did you intend doing?"

"I intended to outrun the dog, but I didn't. I'm through." He spat disgustedly. "If you gents will let me go I'll promise to leave town tonight and never come back, and I'll tell you why I'm here and all about it. You ain't got anything on me. You can't do anything more than get me sent up as a vag. What do you say?"

Westgate looked at Wilkins. After a scowling interval, Wilkins nodded.

"Go ahead," said Westgate.

"Well, I'd laid out to clean up on this neighborhood. Three times I've tried it during the week—once at that house on the corner, once at the bungalow across the street, and tonight, and every time old Lop Ear yonder has caught me at it." His eyes rested upon the dog not unadmiringly. "I don't lay it up against the dog; he's doin' his duty, and I know he's on the square. Night before last he made a big fuss, barkin' and growlin', and I rockon folks around here thought he was chasin' cats or somethin', and likely they cussed him and his owner some and threatened to complain to the police."

Wilkins glanced at Westgate, who noted something like a blush on the other's face, but said nothing.

"But he was after me, and I was after a watch and some other things I'd spotted through a window. I played tag with him for a while—thought I'd fool him—that's why he barked. He can't be fooled, that dog can't. He's considerably smarter than he looks. Tonight I brought him some meat—"

"Poisoned?" asked Westgate quickly.

"O, no! I hain't fell that low yet. If I can't beat a dog's brain with my man's brain, I give up—that's the kind of a sport I am. G' bye, gents."

"Wait," said Westgate sharply.

The man turned. "What!" he snarled, "you ain't goin' to double cross me, are you?"

"Certainly not. I want to shake hands with you, that's all. A pleasant journey to you."

As the man faded into the shadows, Wilkins spoke. "Westgate," said he meekly, "tell your dog to—to run over to our house any time he feels like it."

HINTS FROM HOUSEKEEPERS

Canned Pears Spoiling

If the lady from Santa Maria who has trouble getting her canned pears to keep will try cooking them longer she will find her trouble will disappear. For years I had the same trouble till a friend told me to cook them till they turned pink and my trouble would vanish.—Subscriber, San Fernando.

Cement Floor for Kitchen

A few weeks ago someone asked for the experience of those who had lived in homes where cement was used for kitchen floors, as she was considering such a one for her kitchen. I had a winter's experience and hope I may never have another. The principal objection is the tiring effect on the entire body. One comes to the end of the day worn out. Then the cement is so cold that one feels the cold through the shoe sole on a cold morning. Personally I would choose a bare wood floor every time in preference to cement.—Subscriber, San Fernando.

Simple Cucumber Recipe

Fill quart jar with small cucumbers well washed, crowd in close as possible. Take heaping tablespoon salt, small tablespoon mustard. Mix with a little vinegar until smooth, then pour on enough vinegar to fill the jar. Put

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Therefore, we promise to deliver all patterns ordered within **TWO WEEKS;** we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 80 of the various simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

on rubber and top tightly and keep a month before using. They will keep indefinitely. It is such a nice recipe as small or large amount can be made. M. E. H., Walnut Grove.

Pear and Peach Sweet Pickles

Take 1 quart vinegar and 5 or 6 cups sugar, whole stick cinnamon, whole cloves, small amount of each. Let come to boil, put in fruit and cook till tender, put in cans and seal. They never spoil.—M. E. H., Walnut Grove.

Canned Crabapples

In answer to the call for crabapple recipes I am sending one that my mother used when I was a girl and I have always used when I could get the crabapples, but I am sorry to say I can't get them here. I bought some nursery trees, but they did not prove to be what I ordered and we grubbed them out.

I always use the large red kind, just wash them and cut out the blossom end and as much of the core as you can with a small pointed knife, leaving the stem, and cook, using sugar to make quite rich syrup. Seal. I use a small pocketknife to core them.—Mrs. H. E. B., Galt.

Pickled Crabapples

Six pounds of fruit. Leave the stems on and remove the blossom end. Three pounds of sugar, 1½ pints vinegar, with 1 ounce stick cinnamon and ¼ ounce cloves. Boil syrup ten minutes. Steam the crabapples in a steamer until tender, then put in syrup and let boil five or ten minutes, not enough to break, and can immediately.—Mary Bosworth, Stockton.

Crabapple Pie

For these recipes you can use the crabapples that have been drained for jelly but not pressed.

Cook whole crabapples until soft. Rub through colander lightly and use pulp. 1½ cups pulp, 1 cup sugar, 1 tablespoon flour, flavor with cinnamon and nutmeg. Fill crust and smooth top. Pour over the top the following mixture: Beat 1 egg, ½ cup sugar, 2 tablespoons flour, ½ cup cream (sour or sweet), beat up together and pour over the top and bake.

Bake with 1 crust: 1½ cups pulp, 1 cup sugar, yolks 2 eggs (beaten), 1 tablespoon flour. Cover with meringue: Beat whites of 2 eggs, 2 tablespoons sugar, flavor with lemon. Spread on on top and lightly brown. — Georgia Palla, Linne.

Sugar Pie

Line pie plate with crust. Sprinkle over crust 1 cup brown sugar, ½ cup flour sifted over sugar, sprinkle with cinnamon. Turn over this ½ cup cream, sweet or sour (or dot with butter instead of cream). Bake light brown.—Georgia Palla, Linne.

How to Cook Prunes

A great many persons do not know the correct way of cooking dried prunes, so I am sending a recipe from a prune raiser: Wash the prunes through several waters, then pour boiling water on to cover well and let stand all night. In the morning put on to boil in the same water and allow to boil down slowly till the water becomes a thick syrup. Do not use any sugar; the sugar in the fruit is sufficient. They are delicious.—A. E. W., Pasadena.

The Cultivator has request for variety of prune recipes. Can our readers help us out?

HOME DRYING AND SULPHURING OF FIGS

Continuous requests come to the Cultivator for copies of the issue of June 11, 1921, giving directions for drying figs. Extra copies are practically exhausted, so that we are glad to reproduce here method given by Mrs. Malinda Woodworth, home demonstration agent in Riverside County. Mrs. Woodworth says:

"To dry, place the figs on trays in the sun, protected from fogs and insects. Dry until they still give in the hand when squeezed, not until they rattle. Wash 20 minutes in cold water containing four ounces of salt to every gallon. Dry again for one-half day. The figs will plump up.

"Pile them up for a week or two to sweat and pack in clean boxes or jars and seal.

"To sulphur figs, place them on wooden or cloth trays. Pile up trays and cover with a tight box, under which burn sulphur for two or three hours. The sulphuring bleaches the figs and helps to keep away insects. It is not essential, however."

HOUSEHOLD QUERIES

Romance of the Counties of California

There is an inquiry in the Cultivator in regard to the book, "The Romance of the Counties of California." That story has been published in serial form in the San Francisco Examiner for the past two or three months. It is, I believe, being published in book form now.—Subscriber, Turlock.

SOME UNUSUAL CONSERVES

Raisin Jam

3 cups rhubarb, 3 cups sugar, 6 oranges, 1 cup Sun Maid seeded raisins, ¾ cup chopped walnut meats or blanched almonds.

Cut rhubarb in small pieces. Add sugar and cook until tender. Add orange pulp and raisins, cut in small pieces. Cook until thick—about 20 minutes. Add nuts and cook 5 minutes. Pour into pastry shells for tarts or serve as jam. This may be served as a dessert with whipped cream, if desired. If made in a large quantity it may be poured into sterilized glasses and sealed with paraffine.

Plum and Raisin Jam

6 cups pitted plums, 3 cups water, 2 cups Sun Maid seeded raisins, 4 cups sugar.

Cook plums in water until they begin to soften. Add raisins and sugar. Cook slowly, stirring occasionally, until mixture is thick—about 40 minutes. Pour into sterilized glasses and seal with paraffine. This makes about 6 glasses.

Oriental Marmalade

2 cups dried apricots, 1 cup dried figs, 1 cup dates, 2 cups Sun Maid seeded raisins, 4 cups cold water, 1½ cups brown sugar, 2 lemons.

Cut apricots, figs, dates and raisins in pieces. Cover with cold water and soak over night. Add sugar and juice from lemons and cook slowly until thick—about 40 minutes. Pour into sterilized glasses and seal with paraffine. This makes about six glasses.

Rhubarb Compote

6 dried figs, cut in pieces, 1 cup cold water, 6 cups sliced rhubarb, 3 cups chopped Sun Maid seeded raisins, 3 oranges, 1½ cups sugar, 3 bananas, sliced, 1½ cups broken walnut meats.

Soak figs over night in cold water. Add rhubarb and raisins and cook until thick—about 45 minutes. Add orange pulp, sugar and bananas and cook 10 minutes, stirring often. Add walnuts and cook 5 minutes. Pour into sterilized glasses and seal with paraffine. This will make about 6 glasses.

Prune and Raisin Conserve

1 cup prunes, 1 cup Sun Maid seeded raisins, 2 cups cold water, 1 cup brown sugar, 1-3 cup vinegar, 1 teaspoon cinnamon, ½ teaspoon clove, ½ teaspoon allspice, ½ cup chopped blanched almonds.

Soak prunes and raisins over night in cold water. In the morning cook in the same water until prunes are tender. Discard pits from prunes and cut in pieces. Add sugar, vinegar and spices. Cook until thick—about 45 minutes. Add almonds and cook 5 minutes. Pour into sterilized glasses and seal with paraffine. This makes about 6 glasses.

Raisin and Fig Conserve

3 cups dried figs, 3 cups water, 1 cup sugar, ½ cup orange juice, grated rind of 1 orange, ½ cup lemon juice, 3 cups chopped Sun Maid seeded raisins, 2 cups broken walnut meats.

Chop figs. Cover with water and soak over night. Add sugar, orange juice and rind, lemon juice and raisins and cook slowly until thick—about 1 hour. Add nuts and cook 5 minutes. Pour into sterilized glasses and seal with paraffine. This makes about 6 glasses.

HAD NOTHING ON HIM

She (with magazine)—This article says that the emperor of Japan has 10 men to carry his umbrella.

He—That's nothing. I'll bet 20 men have carried mine.—Enid (Okla.) Daily News.

HEATING THE HOME

Heating the California home is not a very serious problem. However, occasionally one wants to know as to methods of maintaining a more equitable temperature during the months from December to March. Those who do not have sufficient eucalyptus trees to furnish a log for throwing into the fireplace on a rainy day or a cool evening may be interested in Farmers Bulletin 1174 of the United States Department of Agriculture, Washington, D. C., "One-register Furnaces."

This bulletin discusses the principles and the advantages and disadvantages of the one-register warm air house heating system. It is not the purpose to recommend this system in preference to others but to present the facts in order to assist the householder in selecting a heating system that will give the best service and most satisfaction for the money expended. The system of warm air heating treated in this bulletin is that in which all the heat is supplied through one register. It has come into much favor during the last few years. It is known by a variety of names, one-pipe, pipeless, one-heater, single-heater, one-register, or single-register, and not infrequently by the name of the manufacturer of the furnace. This bulletin explains the system, illustrates the circulation of cold and warm air in the rooms, and points out conditions under which satisfactory service can be expected.

ORANGE VINEGAR

Here are directions sent out by the California Fruit Growers Exchange for making orange vinegar:

Put the juice from six Sunkist oranges in a glass jar; also a cake of compressed yeast, dissolved in a little of the juice; cover with cheesecloth and let stand in a warm place about a month, or until sour enough to use in place of cider vinegar.

UNAPPRECIATED

"So that's the oldest inhabitant—104 years old?" said a tourist in a village. "No wonder you're proud of him." "I dunno about being proud of him," responded a native. "He ain't done nothin' in this yer place 'cept grow old, and it's took him a long time to do that!"

LIMERICK NO. 888

Once a young fellow named T8
Asked K8 if she'd be his m8.
"I'm sorry to st8
I'm married," said K8,
And such was the young fellow's f8.
—Riverside Press.

THE RACE

Griggs: I repeat, the race is not always to the swift!

Briggs: Righto! The hare gets in the soup as often as the turtle!—Cartoons Magazine.

PROMISES

"Have you kept all the promises you have made?"

"Kept 'em!" exclaimed Senator Sorghum. "I haven't even kept count."

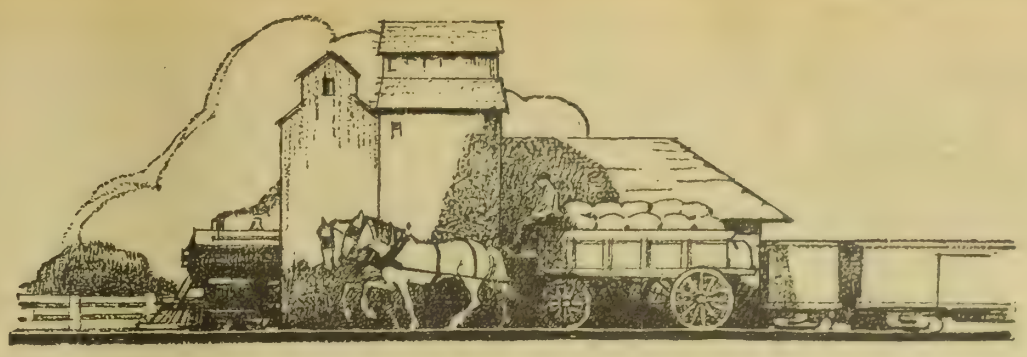
The time to fix yer tractor
Is 'afore she's on the bum,
But the feller that'll do it
I claims he's goin' some!
—Zeb Jones.

The time to lock yer barn
Is 'afore yer horse is stole.
The time to sell yer corn
Is 'afore ye've spent yer roll.

"If smoking of cigarettes on the part of women is especially obnoxious to men it will probably become a reminder of the fact that cigarette smoke is equally obnoxious to the average woman."

While the highways are getting terribly crowded with automobiles, yet the congestion is somewhat relieved by the large number being smashed up all the time.—Pajaronian.

Let scientists seek vitamines,
With Nature intervening.
Just eat eggs, butter, meat and greens,
You'll get the viti-meaning!



Has the Farmer a Real Grievance?

Yes, he has!

He has a real grievance because the prices he receives for his products have declined more than have the prices he must pay for almost everything he buys.

Because of these facts the farmers are not making as large profits as they believe they are entitled to make. Some blame their troubles largely on the railroads. "Freight rates," they say, "are the cause of low prices for grain and livestock."

The real cause lies much deeper. The decline in the prices of farm products began before freight rates were advanced, and would have occurred if freight rates never had been advanced. It is due to world-wide changes resulting from the transition from war to peace.

The Railways Have the Same Grievance as the Farmer

The rates the railways are getting, although they have been advanced, are much lower in proportion than the cost of almost everything the railways must buy.

The average passenger rate is about 50 per cent higher, and the average freight rate about 74 per cent higher, than five years ago—in 1916, before this country entered the war.

From these facts it might be thought that the railways should be making money.

BUT—the prices the railways are paying for

Materials and Supplies are now 65 per cent higher than in 1916;

Taxes are 90 per cent higher;

Coal per ton is 144 per cent higher; and

Wages of railway employees are still 124 per cent higher per hour.

In consequence of these things, while the total earnings of the railways are 60 per cent greater than in 1916, THEIR EXPENSES ARE 110 PER CENT GREATER and THEIR PROFITS, SINCE THE PRESENT FREIGHT AND PASSENGER RATES WERE MADE, HAVE BEEN LESS THAN ONE-HALF AS GREAT AS IN 1916.

What has happened to the Railroads since 1916:

Increase in Revenue [redacted] 60%

Increase in Expense [redacted] 110%

In 1916 railway wages were $1,469,000,000. After the Railroad Labor Board advanced them last year they were at the rate of $3,900,000,000, an increase of 165 per cent. The recent reduction ordered by the Labor Board was only 12 per cent, leaving wages about $2,000,000,000 greater than in 1916.

Coal cost $1.76 per ton in 1916, the total fuel bill being $250,000,000. In 1920 the average price was $4.20 per ton and the coal cost $673,000,000, or $423,000,000 more than in 1916. The average cost of railway coal is now $4.29 per ton.

With prices of materials and supplies still 65 per cent higher than in 1916, the materials and supplies which the railways bought for $447,000,000 in 1916 would now cost them $750,000,000, or over $300,000,000 more.

Present Railway Rates Chiefly Due to Labor Costs —Not to Return on Capital

Existing railway rates are higher not because railroad capital is receiving or seeking a larger return, but because railroad LABOR, and labor producing things the railroads must buy, is getting so much more than formerly.

EVERY INCREASE in rates since 1916 has been intended to meet—but has not met—these increased expenses, CHIEFLY LABOR, and NOT to increase profits.

Railway profits have GONE DOWN.

In 1916 the railroads earned 6 per cent. In 1921 they will be fortunate if, on present rates and present expenses, they earn 3 per cent.

A GENERAL reduction of rates now could not be made without BANKRUPTING most of the railways and making business of ALL KINDS much worse for everybody.

The managements of the railroads are making every effort to reduce expenses so that rates can be reduced later. Some reductions of rates already are being made.

There is NO OTHER WAY than by reductions in expenses to secure general reductions in rates that will not be ruinous to the railways and make them unable to render to the farmers the transportation service they need. Those who obstruct reduction of expenses not only hurt the RAILROADS but the FARMERS as well.

Association of Railway Executives

F. L. Washburn, for many years president and general manager of the Western Meat Co., has acquired an interest in the long established and growing business of Chas. S. Hardy at San Diego and will assume the active management of the business. The growth of Southern California, the development of the Imperial Valley and the improved conditions in the Republic of Mexico all help to give San Diego a commanding location for securing a continually increasing business.

Judges announced for stock classes at the Southern California Fair at Riverside, October 11-16: W. H. Standish, Lyons, Ohio, dairy cattle; Frank W. Van Natta, Ontario, beef cattle; Prof. E. H. Hughes, Davis, horses; Carl P. Thompson, Stillwater, Oklahoma, hogs.

A LIVESTOCK SHOW AT SAN FRANCISCO

After a lapse of a year a livestock show will again be held at San Francisco, and while it is recognized that the show this year will be held under circumstances that ordinarily would not be considered favorable, the fact that the California National Livestock Show is to be held at all indicates that there is a real need and a real place in this state for a big livestock exhibition at the close of the general fair season.

The initial show will be held in San Francisco, October 22-30, and will be housed in large tents to be erected at Twelfth and Market Streets. The premium list makes provision for cattle, horses, sheep, goats and pet stock and poultry. No swine will be shown for the reason that the health authorities refused to permit the exhibition of swine in that location. The money prizes offered for the above classes of livestock are very liberal and sufficient evidence has been manifested to assure a splendid showing. Plans are already under way looking to the financing of a permanent show beginning next year. The breeders of California are determined to have such a show and the city officials of San Francisco are entering into the project with enthusiasm.

The management of the show this year rests in the hands of the livestock interest of the state, which assures a business like exhibition. C. N. Hawkins, president of the show, is one of the best known livestock men of the West; C. R. Thomas, general manager, is well known through his connection with the Los Angeles shows, and John A. Bunting, secretary, is likewise secretary of the Pacific Coast Hereford Cattle Breeders Association. The directors are: Geo. V. Beckman, H. V. Bridgford, John A. Bunting, Owen Duffy, Ansel M. Easton, Sam H. Greene, C. N. Hawkins, Geo. H. Hecke, Frank E. Honeywell, Romie C. Jacks, H. A. Jastro, E. B. McFarland, R. P. Royce, T. H. Ramsay, B. F. Rush, Wm. H. Saylor, D. J. Stollery, W. T. Summers, J. I. Thompson, J. E. Thorp, Wm. A. Ward, Jno. P. Walker, Alex M. Wilson.

The California National Livestock Show is in every way worthy of the unstinted support of the livestock interests of the state and the entire West, and it is to be hoped that the initial show will be the forerunner of a permanent show such as will be a credit to the state.

YOUNG CALVES MUST HAVE CARE

The first important factor in raising good healthy calves is breeding, and the second is the care they receive before maturity.

The proper feeding of the calf begins before it is born. Cows in a poor condition give birth to weak calves that are difficult to raise. A cow should be dried off at least six weeks before calving. When about to freshen she should be given a clean stall to avoid danger of infection. If there has been any white scours on the place the navel should be disinfected with tincture of iodine immediately after birth.

The calf must have the first milk, or colostrum, but may be taken from its mother on the second or third day.

In case the cow should die in calving or develop disease, like garget or milk fever, whole milk from another cow should be substituted, and the calf given two or three tablespoonfuls of castor oil.

Whole milk should be fed until the calf is two or three weeks old. Skim milk may be gradually substituted. It is of the utmost importance that calves be fed the same amount of milk, at the same temperature, from clean buckets, at the same time each day. Never feed enough milk to quite satisfy hunger. Sterilize the milk buckets, which are used for feeding the calves, each day, the same as the milk cans.

You can't raise healthy calves by feeding several of them, of different sizes, in a trough. It is economy to feed calves in stanchions, asserts Geo. H. Glover of the Colorado agricultural college. They will spill less milk and cannot suck each others ears, which is detrimental. The fat that has been removed in skimming may in a measure be substituted by adding a handful of linseed or corn meal to each pail of milk. Calves will begin to eat hay and grain at an early age especially if they are in the same pen with older calves. The main thing in raising calves is cleanliness, regularity, and freedom from overfeeding.

HOW CHEESE GETS ITS FLAVOR

In perusal of standing literature by the division of animal industry, of the state department of agriculture, with regard to the production or development of the various flavors of cheese, the following reasons as gleaned from authorities on the subject may enable us to comprehend in a measure the causes of the characteristic tastes and odors of cheese.

The flavor of this product develops during the ripening process and is due to the splitting up of the casein, to the salt added to the curd, and, in some instances, to those bodies elaborated by molds which develop in the cheese. This cleavage, or splitting up, gives rise to the fatty acids and their compounds, as well as to the ammonia-like bodies of which a thoroughly ripened cheese contains a large amount.

The dissolving of the nitrogenous material of cheese and the other changes taking place are brought about mainly by the action of enzymes or micro-organisms originally present in the cheese. These changes are to be considered fermentative rather than putrefactive.

Mild cheeses are ripened in large bulk. Thus, a relatively small surface is exposed to the air, and in some cases, the rind is covered with a coat of paraffine. If, however, a strong taste is desired in cheese, it is ripened in small pieces, thus exposing more surface to the action of the air.

The preference for cheese of mild or strong flavor rests with the individual, and from the chemist's point of view there is no reason for stating that highly flavored cheeses with strong odors have undergone putrefactive decomposition.

FLY SPRAYS

Two gallons of kerosene, 1 quart of pine tar, ½ pint of crude carbolic acid. The addition of 1 quart of fish oil will improve the mixture.

Another spray consists of 1 gallon of kerosene, 5 oz. powdered napthaline, and 1 pound of laundry soap dissolved in hot water. Sufficient water is added to make 4 gallons of the mixture. It may be applied with a sponge or cloth.—Wisconsin College of Agriculture.

DONATION SALE

Following their usual custom the members of the Western Berkshire Congress will hold their annual sale of Berkshires at the California State Fair this year for the benefit of their publicity and promotion fund.

Some very high class animals are being consigned by prominent breeders of the various states on the Pacific coast and unusual interest is being manifested. The exact date of the sale has not yet been announced but will probably be held following the placing of awards in that division.

For the Prevention of
ANTHRAX
Of all livestock diseases, anthrax is one of the most fatal.
For the preventive and curative treatment of anthrax we offer
ANTHRAXOIDS
(Spore Vaccine)
For immunizing cattle, horses, sheep and mules.
Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.
Antianthrax Serum
A serum to be used when animals show symptoms of anthrax.
Anthraxoids-Antianthrax Serum
(Simultaneous Treatment)
Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.
Write for free booklet on the Prevention of Anthrax.

CATALOGUE AND BUYERS GUIDE
No. 95
Fall and Winter 1921-22

Your FREE Copy of this Book is Waiting Here for You to Write for it

PRICES are an interesting study today. There is one price here, another there, for the same article. To buy at the lowest price, you must compare prices before you buy.

Ward's New Catalogue is today indeed a Buyers' Guide, a standard for price comparison—giving you the new low prices, some astounding prices, based on the new low costs of *new* merchandise.

To have this book is to know what new goods should cost you. It tells you the prices you should pay for everything you buy—prices backed by a forty-nine-year-old guarantee and record of fair dealing.

WARD'S—The Oldest Mail Order House is today the most progressive

Any man or any business that does not go forward, goes backward. Ward's is going forward—going forward in giving you quicker and more correct service, in choosing for you only the latest and most reliable merchandise—is going forward in searching more carefully and more expertly for ways of getting lower and lower prices—to make your Savings larger, your Satisfaction more complete.

Every page in the new Catalogue we are holding for You—shows this spirit of Service and of Saving—of Progress in Service and Saving for You.

For the Home and Farm:

Ward's Catalogue shows astoundingly low prices.

	Last year's prices	This year's prices
Mattresses	$ 25.50	$13.95
Metal Beds	18.20	14.45
8-ounce Ticking	.68	.27
Percale	.38	.16
Brussels Rugs	31.95	23.95
Team Harness	118.25	80.75

For Men:

	Last year's prices	This year's prices
Sheep-Lined Coats	$ 12.95	$ 7.95
New Worsted Serge Suits	28.75	15.95
Gloves	2.94	1.98
Boys' Melton Overcoats	14.95	9.45

Every page tells a similar story of astoundingly low prices.

For Women:

Wonderful materials at prices that have not been possible for years—such as:

	Last year's prices	This year's prices
All-Wool Storm Serge	$1.39	.98
32-in. Chambray	.20	.14
32-in. Dress Gingham	.42	.30
40-in. Colored Voile	.36	.26
27-in. Outing Flannel	.39	.15

Waists, hats, shoes, all the daintiest underwear—everything for women's needs, the newest styles—at prices almost one-half.

$30,000,000 of New Merchandise Now Being Bought

Ward's is today searching the markets with ready cash, buying goods at today's lowest prices—for YOU.

$30,000,000 worth of new merchandise is being and will be bought by Ward's, bought wherever quality is highest and prices lowest.

To write for your Catalogue, to buy at Ward's, is to get new fresh goods at prices based upon the new low costs of raw materials, the new low costs of production.

Today you need to make sure that you are getting the full benefit of the big break in prices. To write for this book is a precaution against profiteering, and a measure of economy.

This page is published merely to tell you that one copy of Ward's New Fall Catalogue is waiting here for you.

You need only to fill in the coupon below, and the complete book, with Everything for the Home and Farm, Everything in Men's and Women's needs, will be sent you free.

Before you turn this page, clip the coupon and fill in your name and address for this complete guide to today's correct prices.

When Writing Advertisers Mention California Cultivator.

Blood Weighs

By Howard W. Vaughn

A SHORT time ago the local butcher of a certain California town visited Mountain View Ranch with a farmer friend who was in search of a bull calf. As the herd sire, not yet three years old, was being inspected the butcher was asked to guess his weight. With a confidence born of daily experience in estimating cattle weights he promptly answered, "1,800 pounds." The bull had been weighed over certified scales the week before when he tipped the beam at 2,060 pounds.

This particular butcher was probably an example of many country butchers in California who have developed the very unpopular but workable system of converting five cent cattle into 35 cent meat, and the majority of their stock in trade when on foot is blessed with but two dimensions, length and height. Of width or depth or thickness there is often no suggestion. When the actual weight of our herd bull was announced to the visiting gentleman he spent some minutes fore and aft and meekly replied: "I had not noticed the width of the bull. He is deeper, too, than I had thought. We are not accustomed to seeing such cattle."

I am not surprised that the man missed the weight of the bull. The cattle in which he deals have been developed by the use of generations of inferior grade bulls. What wonder that he failed to note the difference when shown a beast whose ancestors for 20 generations or more have been selected by the best farmers of Scotland and America in an effort to produce the greatest quantity of high quality beef at the earliest age. The one type, like a home in a cave, just happened. The other, as much different as a millionaire's residence, represents the life work of the world's best livestock architects.

The cattle produced in California and intended to be sold for beef represent an extreme range in type. Watch the cattle as you ride along the road. There are herds where length of legs and horns and the "coat of many colors" indicate a mixture of breeding with no thought on the part of the owner to improve the type. "Any old bull" has been good enough on this ranch. But there are other herds to be seen where wide backs, deep bodies, short legs and short, graceful horns indicate the presence on that ranch of a man who thinks and cares—someone who buys a good bull and then takes care of him. To such a farmer I always count it an honor to sell a bull, for I am convinced that the requirement of the sale was the merit of the beast. Such men always buy pure bred bulls. There are many such herds in this state. These herds, together with the example of the state college in raising and exhibiting steers that became nationally famous as exponents of the most highly developed beef type should be practical evidence enough, first, that there is a distinct type to which the best beef cattle conform and second, that cattle of this type have been and can be raised successfully in this state, and if you ask the owners of the best herds you will be told that no other type will prove as profitable.

There is something in the pure bred animal that gives him the ability to transmit his type to his offspring. We call it prepotency. The sire which lacks prepotency is of but little value. Occasionally we may get desirable offspring from heterogeneous matings, but we must have something more than the occasional production of a good calf. Within reasonable bounds, our sire must be a sure and true breeder. The real farmer is content with nothing less.

The prepotency of a sire depends largely on the concentration of his blood. The skilled stock breeder often resorts to policies of line breeding or even inbreeding in order to produce the truest types. By so doing, he puts into one animal an extraordinary power to reproduce its own characteristics. We cannot all use these methods with safety, but we can follow their principle in the use of breeding animals whose pedigrees are filled with sires and dams of special merit and in which there are no violent outcrosses.

There is nothing which lowers the standard of livestock so much as the indiscriminate intermixing of breeds. We may get discouraged if marked improvement does not occur in our herd. We conclude that we are using sires of the wrong breed. We buy a sire of an entirely different breed. If it is a cross of two beef breeds the first cross may prove attractive, but subsequent generations betray the mixture of blood. The best of individual sires are then unable, without successive generations of use, to bring back the original state of perfection.

The immediate parents influence their offspring to the extent of 50 per cent, grandparents 25 per cent, great grandparents 12½ per cent, etc. It is because of this that the more we use of good pure bred sires the less improvement we note from one generation to the next. A pure bred sire has a marked influence on a mixed grade dam, but on a seven-eighths pure bred dam of his own breed his influence is not so evident. This does not mean that there is a lack of improvement. On the contrary, every pure bred cross adds that much more purity to the blood and insures a truer prepotency.

To grade up a herd, to gain more of the "blood that weighs" is not an expensive process. The purchase of many high priced females is not essential. Use care in the selection of the bull—that he be of right type himself and that he be from good ancestry. This is imperative. Blood weighs. As long as we sell cattle by weight at a price determined by their quality the best beast is found to be the most profitable.

W. TERKELSEN OF HUMBOLDT COUNTY WINS CULTIVATOR PRIZE FOR JULY

By F. W. WOLL

Five cows owned by W. Terkelsen of Ferndale, Humboldt County, had the highest average production of butter fat for five grades in the state dairy cow competition during the month of July, viz., 66.16 pounds butter fat, and the California Cultivator prize for that month was accordingly awarded to him. The production of the individual grades for the month was as follows:

	Days in Milk.	Milk Lbs.	Butter Fat Pct.	Butter Fat Lbs.
Dinah	42	1451	5.3	76.90
Christina	101	1293	5.1	65.94
Amy	113	989	6.5	64.29
Laura	111	1283	4.9	62.89
Annie	113	1085	5.6	60.76
	96	1220	5.42	66.16

These cows are all grade Jerseys, and all but two are mature animals. They stood first among similar groups of grades in twenty-three dairy herds in different parts of the state that competed for the Cultivator prize the past month. The average production of butter fat of all but seven of these groups came above 50 pounds. The lowest-producing grades averaged 19.96 pounds.

Five grades owned by the following dairy farmers produced an average of over 50 pounds of fat during the month, viz: W. Terkelsen, 66.16 lbs.; M. Pontoni, Arcata, 64.18 lbs.; J. A. Genzoli, Loleta, 63.45 lbs.; W. F. Early, Grizzly Bluff, 60.82 lbs.; E. Graham, Compton, 59.97 lbs.; N. Hauck, Alton, 58.58 lbs.; P. Iversen, Grizzly Bluff, 55.96 lbs.; Arden Certified Dairy, El Monte, 52.44 lbs.; Adohr Stock Farms, Van Nuys, 50.95 lbs.; H. L. Wakeham, Santa Ana, 50.53 lbs.; Giacomini & Pedrotti, Waddington, 50.56 lbs.; F. F. Pellissier, Whittier, 50.03 lbs.

This is the fourth time in succession that the Cultivator prize has been won by a Humboldt County farmer. Judging from the line-up during the last few months, it is likely to continue to go to this county for some months to come. The records of production during the past month by the prize winning grades, as well as by most of the cows entered in the state dairy cow competition, are lower than during the preceding months, owing to the advance in the lactation period

of cows and, in most cases, to less favorable feed conditions during the month. Still, these grades averaged an equivalent of over 2½ pounds commercial butter per head daily for the month, and all the cows in the competition averaged nearly 2 pounds of butter a day, which is an improvement of about 100 per cent over the production of ordinary "good" dairy cows.

FEEDING MILK GOATS

By G. E. Gordon

There seems to be a popular opinion that goats will do well on almost any kind of feed, but this is entirely erroneous. There are several principles to consider in making up a ration. In the first place it must be fairly bulky, at least bulky enough to satisfy and aid digestion. It must be palatable, that is, it must be made up of feed that the goat likes in order that the goat will eat a sufficient quantity to enable it to produce milk in quantity. It must be succulent. The natural feed for animals is the succulent grass and this must be as nearly replaced as possible. If some form of green feed is not available silage is good but can only be used where a reasonably large quantity is necessary, as it spoils readily when exposed to the air. Beet pulp fills in quite satisfactorily to replace succulent feed. Pumpkins, beets and mangels can be used in reasonable quantity. The ration must be balanced, that is, it must supply the proper nutrients and the proteins must be properly balanced against the carbohydrates and fats. The ration must be economical and should contain as large a quantity of home grown feeds as possible. Roughage feeds can best be fed in the rack in the corral. Concentrates can be fed to good advantage while the animal is being milked, as the animal then is in a mood to let her milk down readily when she can be milked more easily. The advantage of root crops can hardly be overemphasized. They provide succulence and in addition the dry matter contained in roots is about equal to the dry matter contained in grain. Some succulent feed, such as silage or roots or, if these are not obtainable, beet pulp makes a good substitute, and these should be fed with the more concentrated feeds and will tend to lighten the concentrates. Mix them up with these other feeds so that in the process of digestion more can be gotten from the concentrates. Alfalfa hay is a standard roughage feed. Sudan grass and grain hay can be fed to good advantage in smaller quantities. Barley is a standard grain and this can be mixed with other concentrates. Some of the feeds commonly used and which give good results are linseed oil meal, cottonseed meal, coconut meal, bran, middlings, corn. It is well to have as much variety as possible in the ration. Only very small amounts of linseed or cottonseed should be fed. A slightly greater amount of coconut meal can be fed than either of the above mentioned, while bran or middlings can be fed in larger quantities, as can barley. A reasonably good mixture can be made up of 1 part cottonseed meal, 2 parts coconut meal, 2 or 3 parts bran or middlings, and 2 parts barley, together with about 4 parts of beet pulp. The proportion of these feeds will depend somewhat on the amount of alfalfa hay or Sudan grass or silage that can be fed.

If the above mentioned rules are followed, good results will be obtained.

Milk Fever

By G. E. Gordon

MILK fever, or parturient paresis, is one of the common difficulties confronting dairymen. Unfortunately, this trouble is confined almost entirely to the best cows. This is a paralysis in cows just before or just after calving. It is most found in cows at third, fourth or fifth calving periods and usually follows calving. A symptom of milk fever is a staring eye. The animals show weakness, especially behind, and walk unsteadily, if they are able to stand at all. They have an excited appearance and continue to be excited after they are down. They may try to get up but in most cases are unable to do so. After the trouble is farther advanced they are in a sort of coma, or sleep, and usually lie out flat with head on the ground or with the neck cramped somewhat. In this stage they are usually motionless, and sometimes appear to be about dead. The eyes may be set and glazed if they are open. At a later stage the cow may go into convulsions. In this event the animal may raise up on her stern and then fall back and strike her head on the ground. This often causes bruising about the head. Following this the eyes are usually very dry and glassy. There is no high temperature with this trouble; in fact, the temperature is below normal.

There are several complications that may set in following milk fever. It is dangerous to attempt to administer any medicine in a case of milk fever, as the animal cannot be satisfactorily drenched because she is paralyzed and unconscious and the material given may go into the lungs and cause foreign body pneumonia. There have been very rare cases of cows having milk fever some time after calving, but this is quite unusual. This trouble also usually occurs with very high producing cows and especially when they are in good flesh.

It is sometimes difficult to prevent milk fever, but from the fact that it occurs with cows that are in good flesh it is sometimes desirable to put them on a diet for ten days or two weeks before calving and feed very carefully during this time. It is also sometimes desirable to administer a dose of Glauber salts a few days before calving which should be followed by laxative feeds. The condition of milk fever is probably due to the absorption of some product from the udder which is probably protein or proteic acid.

The best known treatment is inflation of the udder with air, forcing the milk from the absorbing tissues, allowing the animal to recover. This should be very carefully done, and if the dairyman is not fully conversant with this method it is best to call in a veterinarian. An outfit for the treatment of milk fever, however, should be kept at every dairy. In administering treatment the following recommendations should be observed:

First, place the udder on clean straw. Wash udder and teats with soap and water. Disinfect udder and teats and particularly the end of the teat with a two per cent solution of lysol or some other similar disinfectant.

Next, place a clean towel under udder and teats. Remove milk from udder. Udder is then ready to have the teat tube inserted.

The instruments should be sterilized during the primary operation. The teat tube should be boiled for five minutes and the tube with cotton in it should be heated in an oven for 20 minutes in order to make sure that it is sterile. The apparatus can then be connected and the teat tube inserted.

The air is then pumped into the udder through the tube containing the sterile cotton until the udder is completely distended. After the air is pumped in a strip of cloth a half inch or inch wide should be tied around the teat to hold the air in for up to three hours.

If the animal has not fully recovered within three hours, the air should be allowed to escape, the milk again be removed and the operation repeated. Usually, however, the animal will be fully recovered before the three hours are up.

BORN TALENTED

"How you do stutter, my poor boy! Have you ever attended a stammering school "

"N-n-n-no. I d-d-d-do this naturally."
—Farm & Ranch.

Buy a pipe—and some P. A. Get the joy that's due you!

We print it right here that if you don't know the "feel" and the friendship of a joy'us jimmy pipe —GO GET ONE! And—get some Prince Albert and bang a howdy-do on the big smoke-gong!

For Prince Albert's quality—flavor—coolness—fragrance — is in a class of its own! You never tasted such tobacco! Why—figure out what it alone means to your tongue and temper when we tell you that Prince Albert can't bite, can't parch! Our exclusive patented process fixes that!

Prince Albert is a revelation in a makin's cigarette! It rolls easily and stays put because it's crimp cut! Oh, go on! Get the papers or a pipe—and some P. A.!

Prince Albert is sold in toppy red bags, tidy red tins, handsome pound and half pound tin humidors and in the pound crystal glass humidor with sponge moistener top.

POULTRY

Continued requests are being received by the California Cultivator for varieties of poultry not advertised in our columns. If any of you, our readers and friends, have any you wish to dispose of, send a small advertisement to this office and you will be doing our readers a service as well as yourselves.

Day Old Pullets—Here is your chance to get day old White Leghorn and Ancona chicks guaranteed at least 90 per cent pullets. We are taking orders fast for August and September delivery. We also have R. I. Red and Barred Rock chicks but do not separate the sex. All chicks are from strictly thoroughbred laying stock and are hatched right and shipped by Special Delivery Parcel Post. Send for prices and get your orders in at once. We also have a limited number of pullets from two to four months old and yearling hens. Orange County Hatchery, Santa Ana, California.

Petaluma Hatchery—Established 1902 by L. W. Clark. White and Brown Leghorn chicks from heavy laying free range stock, every Monday and Thursday. We positively guarantee safe arrival and full count of good strong chicks and no questions asked. Send for prices and terms. L. W. Clark, Petaluma, California.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, $1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

White Leghorn Baby Chicks — Walter Hogan stock. We get all our eggs from one flock of over 4,000 Walter Hogan hens that have been carefully Hoganized. Our specialty is first class White Leghorn hens that satisfy our customers. We will have chicks September 1st. Lyon Hatchery, Gardena, California.

Baby Chicks—Barred Rocks and Reds, 25, $5.00; 50, $9.50; 100, $18.00; White Leghorns, 25, $4.25; 50, $8.00; 100, $15.00. Shipped every Monday, Parcel Post, special delivery, prepaid. Established 1915. Hargett & Son, Route 2, Box C, Compton, California.

Chicks Every Week from good layers. Fall Broilers pay. Pullets make good layers. R. I. Reds, Barred Rocks, White Leghorns. Safe arrival guaranteed. Write for circular. Stubbe Poultry Ranch & Hatchery, P. O. Box 67, Palo Alto, California.

Baby Chicks from my heavy laying, carefully selected strain of pure bred S. C. White Leghorns. I am booking orders now for September and October delivery. Good chicks at reasonable prices. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live, vigorous chicks guaranteed. No money in advance; pay on delivery. Prices on request. Established 1898. MUST HATCH INCUBATOR CO., 438 Seventh St., Petaluma, California.

Baby Chix from selected, mature S. C. White Leghorn hens. Safe arrival, full count, strong chix, insured. Hawley's Hatchery & Poultry Farm. Route A Box 315A, Lodi, California.

Barred Plymouth Rocks — "Wonderful Layers," champion prize winners. Nothing better in poultry. Choice stock and hatching eggs. Catalog free. Charles H. Vodden, Los Gatos, California.

White Leghorn Baby Chix from Petaluma's heaviest producing stock. We guarantee safe arrival. Literature on request. Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

"Eastman's Bred-to-Lay" Barred Rocks. Fall Chicks—March, April pullets. Fairmead Poultry Farm, Fairmead, California.

Success in business is attained by experience and knowledge. The poultry business can be made to pay by following the teachings and information contained in POULTRY FOR PROFIT, $1.00 postpaid. Cultivator Publishing Company, Los Angeles, California.

RABBITS

Pedigreed Flemish Giants — No fancy prices. Maud Beeching, 1578 W. 46th St., Los Angeles.

ONE WOMAN POULTRY PLANT

(Continued from Page 248.)

Lights for Eggs

The flock is not culled for early molting because experience has shown that the use of lights in winter is apt to bring on an earlier summer molt. Beginning the middle of November, lights are turned on in the morning 15 minutes before sunrise, and this time is increased by the use of an automatic clock, 15 minutes a week till by the middle of December the lights are on a full hour before sunrise and by the middle of January they are on at 3:30. From now on the time is gradually diminished till the middle of March, when the hens are again getting off the roost by daylight. When the change is made so gradually the hens quickly become accustomed to getting up by candle light, and by December the majority of the flock are already off the roosts when the lights come on. Breeders are kept in houses without lights.

Mash for Eggs

A commercial mash is always before the flock, and the proportion of scratch grain to mash is smaller than in many flocks. On the advice of the poultry division of the college of agriculture Mrs. Wise feeds from seven to eight pounds of grain, according to season, daily to 100 hens. This small grain ration compels them to eat more mash, and a better egg yield without any falling off in health is the result. Wheat, hulled barley and corn are the grains used, cracked corn being fed to the young stock and whole to the older hens. All grain is fed in six to eight inches of litter, and the hens are compelled to scratch for every morsel. The kale and alfalfa which are used for greens are fed without cutting, so that all uneaten stems may be added to the litter. Greens are fed always in the morning, and again at night if the caretaker is not too busy.

Mrs. Wise finds men's clothing absolutely indispensable in caring for her large flock. "I tried short skirts first, and then the overalls that are made for women," she said, "but I found there was always some loose corner to catch on nails or wire, and I hadn't time to be always pulling myself loose. I simply could not do the work I do in any other attire."

Poultry Queries

(Conducted by Jean A. Koethen.)

Sour Milk for Hens

Many poultry raisers advise sour milk instead of beef scrap for laying hens. I feed mine all the milk they will consume but do not get the results I got from beef scrap. Please tell me the best ration of other feed to use with sour milk and the amount by weight for 100 laying hens daily. —Subscriber, Napa.

I know the poultry division of the state college of agriculture and other authorities say you can omit beef scrap if your hens have all the milk they can consume, but I do not know of a single poultryman who trusts to milk alone. I met a man last week who was buying buttermilk at 5 cents a gallon for his young stock, and could no doubt have fed it to his layers if he had wished, but he was giving them a commercial egg mash and no buttermilk at all. It is a common practice to keep a dry mash—generally one of the commercial mashes—before the hens constantly, and, if sour milk is available or semi-solid buttermilk is not considered too expensive, to moisten the mash with it once a day and feed what the bird will clean up quickly as an appetizer. Theoretically sour milk is a splendid egg feed; in practice it seems difficult to make the hens consume a sufficient amount to take the place of meat. If you must use it instead of meat, try keeping it before the hens all day in pans and in addition feed a mash moistened with it about 2 o'clock. Keep a dry mash before them also. The formula used at the California farm bureau egg laying contest is probably as good as any. You could omit the 60 pounds beef scrap and 60 pounds fish meal, and make the mash 240 pounds bran, 180 pounds ground oats, 180 pounds middlings, 80 pounds soy bean meal, 30 pounds charcoal and four pounds salt. The scratch mixture used with this mash consists of equal parts by weight of wheat, cracked corn, milo maize and whole barley, fed at night in litter, 10 to 12 pounds daily per hundred hens.

Sick Ducks

Kindly advise me of the probable trouble with White Pekin ducks that seem unable to stand on their feet. Their eyes swell and discharge pus, but they are otherwise strong enough to eat heartily.—Subscriber, Los Angeles.

The ducks are taking cold, possibly from damp sleeping quarters. The

weakness in their legs may be rheumatic, and from the same cause, or it may be because they are in such close confinement that their bodies have grown more rapidly than their leg muscles have developed. The cure in either case is to remedy conditions.

Mating Ducks

How many drakes should I have for six ducks?—Subscriber, Nipomo.

One drake for four or five ducks is the rule followed by duck men. Possibly one to six will be sufficient. You can tell by trying. The age and vigor of the birds are to be considered. Drakes a little older than their mates are preferred.

Hatching Duck Eggs

Can you give me some information about hatching duck eggs by incubator?—Subscriber, Compton.

Duck eggs require 28 days to hatch and are readily hatched in any good standard incubator. The heat should be run at 102 degrees for two weeks and then kept steadily at 103 degrees. The eggs require more airing than hen's eggs and should be sprinkled every other day after the first week. Sprinkle while they are out of the incubator with water about the same temperature as the eggs. On the 26th day eggs and trays should be made quite wet with moderately warm water and the machine closed to remain so till the hatch is over. If your machine is of a type in which special provision is made for moisture you may not need to sprinkle. It is best to follow the directions which come with the machine. Duck eggs should be tested out after 70 hours of incubation when the clear eggs are still marketable, again on the tenth or twelfth and again the twenty-fourth day.

Electric Hatching

Where can I obtain an electric incubator? I wish to hatch by electricity because I believe it is less troublesome and more efficient.—Subscriber, Compton.

I am mailing you names of dealers who sell electric incubators. Electricity is less trouble than kerosene and there is less danger of fire, but you may find it more expensive. It is undoubtedly efficient, and some of the biggest hatcheries are being equipped with electric apparatus.

Feeding Pullets

When should I start feeding wet mash to pullets, and when should a laying mash be given? — Subscriber, Calpella.

It is not necessary to feed a wet mash at all, but many poultrymen do add a daily meal of mash moistened with sour milk to the regular ration of dry mash and scratch feed during the fall and winter months when the pullets are laying their heaviest. The best feeders give growing mash till the pullets are nearly ready to lay, then, when combs are reddening and an egg or two is found in the nests, change to a conditioning mash containing less beef scrap and more corn meal. This is used to delay production a little and keep the pullets from laying a clutch of little eggs and then going into the molt. When the pullets are from five to six months old and can no longer be held back from production the laying mash is placed before them. A good many successful poultrymen omit the conditioning mash and give pullets the laying mash at from three to four months of age.

Another Turkey Ration

A Vacaville subscriber who has had a good deal of experience with turkeys writes that she gets the best results when she feeds the following mash twice a week:

To a pint of bran and a pint of bread crumbs add enough boiling water to make a crumbly mash. Let this cool till it is only slightly warm and add 1 quart chopped greens (lettuce, kale, tender grass or alfalfa), 1 small chopped onion or onion tops, and 1 cup chick grit or sand. For each 10 turkeys to be fed add 3 drops turpentine and ¼ teaspoon ginger. This is fed twice a week in place of the regular mash and twice a day for three days if white spots on the back of the legs (a diarrhoea symptom) are noticed. The regular mash, which is fed in the morning until the poults are three months old, consists of 1 medium sized onion chopped fine and added to 1 quart chopped greens, 1 pint bran and 1 pint hulled barley or oats. This is made into a crumbly mash with sour milk, and ½ cup of chick grit added. The grain mixture contains 2 parts whole barley or oats and 1 part wheat. In starting the poults chick feed alone is used from the time they are 60 hours old till the end of the first week. Then wheat and barley are gradually added and amount of chick feed diminished till the birds are on wheat and barley alone. Mash feeding begins at the end of the first week and the ginger and turpentine mash is given in its place two mornings in the week. Baking soda is given in the drinking water twice a week, ¼ teaspoon soda to 1 pint water. If sour milk is used at first for moistening the mash sour milk must be used thereafter. Sweet milk is just as good, but there must be no change. The mash containing turpentine and ginger is believed to prevent diarrhoea.

INTERNATIONAL COOPERATION

The coming World's Poultry Congress, which is to be held at The Hague, Holland, September 5 to 10, by the International Association of Poultry Instructors and Investigators, will bring together poultry experts from all over the world, and it shows the growth of the cooperative idea in this industry.

California is to be represented by Dr. J. R. Beach of the University of California, who is to attend the conference in order to secure the latest information relative to means and methods of combating poultry pests and diseases. This has been made possible by the raising of a special fund of $1,000 for this purpose by Poultry Producers of Central California, Inc., Poultry Producers of San Diego, Inc., Hayward Poultry Producers Association, Poultry Keepers Association of Petaluma and the Poultry Producers of Southern California, Inc., Dr. C. M. Haring, head of the University of California experiment station. J. H. Barber, manager of Poultry Producers of Central California, Inc., who is now on his way to London to make a survey of the British egg market in the interests of his association, will also attend the World's Poultry Congress as a representative of the San Francisco organization.

ATTRACTIVE PREMIUM LIST FROM SOUTHERN CALIFORNIA FAIR

The premium list is out for the Southern California Fair which will be held at Riverside, October 11 to 16. This will be the ninth annual session of the fair and each year has worked a steady and consistent growth and development. This year the premiums in practically every department show marked increase over last year and in the important agricultural and livestock departments they rank with those of the state fair. An interesting feature is the special attention given to the boys' and girls' clubs and all forms of junior agricultural work. There has been great activity in the junior club work this year and it is estimated that 50 to 60 clubs from all parts of Southern California will contest for premiums at Riverside.

The livestock judging clubs from high school agricultural departments from all parts of the state will be judged at Riverside by a committee of judges selected by the state university. It is planned to send the winners in the contest to the National Livestock Exposition.

CALIFORNIA EFFICIENCY

(Continued from Cover Page)

the first paragraph above. In homes equipped with electric lights or gas there are three states which lead in actual numbers. These are in the natural gas sections and are Ohio, Iowa and Pennsylvania. California comes fourth with 30,519. New York, Illinois and Indiana follow with six to ten thousand fewer homes so equipped. We wish the census bureau had given us information as to homes equipped with electric lights only.

OUTWEIGH SCRUBS

"My steers as yearlings go over the scales at from 1,200 to 1,225. The ordinary scrub steers go out of here as three year olds weighing from eight to nine hundred." With this comment in a letter to the United States department of agriculture, a stockman in Elko County, Nevada, points out the benefits which he has derived from the use of pure bred sires.

"In my opinion," he adds, "even in this country everyone should breed some pure bred strain. Nevertheless the scrub bull dominates even in the face of facts and figures. The average ranchman does not take into consideration that it costs no more to produce a good animal than it does to produce a scrub, and the pure bred is cheaper in the long run."

FAT HOG AUCTION DATES

The California Farm Bureau Marketing Association announces hog auction dates: Wasco, September 3; Modesto, 6; Tegner, 7; Chowchilla, 8; Fresno, 9.

San Fernando Valley Fair people are making final arrangements for the great tents and some of the special features to be noted at the fair which will be held September 19-24. Superintendent O'Neil of the tractor, implement and farm power section, is making final arrangements for the great combined demonstration and "still" exhibit of tractors and implements, and that stock judging arena, the largest ever, is made necessary because of the great number of livestock entries.

A New Fashioned "OLD COUNTY FAIR"

(Official Los Angeles County Fair)

At SAN FERNANDO, CAL. SEPT. 19th to 24th

Six Wonderful Days Six Wonderful Nights

It's Your Fair. Make It a Fair Week.

$1000 a Night Horse Show

With some 800 of the most famous cattle, swine, horses, mules, goats and sheep in California, this show will equal if not surpass the Live Stock Show held last year at Exposition Park.

Los Angeles County Livestock Show

A Style Show of over 200 famous horses of the Pacific Coast. They will be seen in action, running, jumping and in amusing games. Every rider, ring master, attendant and groom will be garbed in superb attire. It will be a genteel performance that will stand out in your memory.

Tractor Demonstration

See in operation the different kinds of Tractors, from the little garden variety to the huge crawler type, combined harvesters, grain and bean threshers, power cultivators, sub-soil and deep cultivators, automatic hay loaders, plows, harrows, automobiles, trucks, and trailers. The tractor demonstration will be larger than anything of its kind ever held in the Southland and will include a complete Power Farming Exhibit.

American Poultry Association Show

This will be the only official American Poultry Association Show held in Southern California this year and on this account it is attracting poultry breeders from all parts of the state.

WINDMILL PRICES REDUCED

For the second time this year the prices of the Auto-oiled Aermotor have been reduced. We are glad to give our customers the benefit of the lower costs of raw material, and of every other saving which our enormous output enables us to make. At the present low prices of Aermotor goods there is no reason why anyone should postpone buying. You can now buy an 8-foot Auto-oiled Aermotor and heavy 33-foot tower for $92.00 f. o. b. Chicago. Prices of all other sizes are proportionately low. Why climb a tower to oil an old windmill when the self-oiling Aermotor, which runs for a year with one oiling, can be bought at such low prices?

A One-Woman Poultry Plant

By Jean A. Koethen

THE question, "Can a woman succeed in commercial poultry keeping?" has been answered more than once in these columns and always in the affirmative. A woman may lack the muscle of her husband or brother, but she is usually able to make her head save her heels, and if she likes chickens well enough to undertake their care on a large scale her sympathetic understanding of the temperamental biddy and her instinct for handling baby chicks more than make up for any lack of physical strength. Mrs. Rose Marie Wise, a clever little Alhambra woman, had always loved chickens, long before she ever thought of keeping more than a back yard dozen or two, and when she ventured into intensive poultry keeping as an outlet for her superabundant energy it was because her love for good fowls led her on. While I talked with Mrs. Wise in a corner of one of her 500-hen units a vivacious White Leghorn hen stood on a box beside us, entering into the conversation whenever there was a second's pause, and assuring me the little lady's love for her snow white pets was reciprocal.

"I can drive a nail with the best of them," declared the little lady, drawing her trousered figure to its full height. "This is a one-woman venture, and there is no place on my program for expensive hired help. Just now for the first time I have hired a boy to clean houses and carry feed. I cared for 2,000 hens by myself, but now I have 3,000 layers and pullets nearly ready to lay I find I must have a little help in the heaviest work."

Last spring Mrs. Wise brooded 3,000 chicks and raised 1,100 pullets, and this fall she plans to brood another 2,000 chicks and bring her flock up to 4,000 by next spring.

An Early Lunch

Mrs. Wise feeding one unit of her 3000 hen flock. The circular spots overhead are burlap sacks laid on the wire to give shade.

It was just two years ago, in August, 1919, that Mr. and Mrs. Wise, with 500 pullets of Mrs. Wise's own raising, moved from Los Angeles to their two acre ranch in Alhambra. These 500 pullets had been raised in a back yard and were the net result of a thousand chicks hatched and brooded the previous spring. As Mr. Wise has his own business in the city it was distinctly understood between them from the first that the chicken business was hers, not his, and must support itself. Mr. Wise agreed to do the carpenter work and give whatever help could be given out of business hours, but the business must stand on its own bottom, and it has done this from the first.

That year egg prices as well as feed prices were at the peak, and the 500 pullets did so well that Mrs. Wise felt justified in increasing her flock. In the spring of 1920 she brooded 5,000 chicks, besides caring for her 500 layers and helping Mr. Wise build the new houses, which were called for more rapidly than he could find time to finish them.

Culling the Young Stock

The chicks are culled with the greatest severity from the day they are hatched. No cripples are allowed to reach the brooder, and on the second day every unthrifty chick is killed. From the second day till the end of the eighth week every chick that lags behind the others for any reason whatever is promptly removed from the flock. After eight weeks, when cockerels and pullets are separated, every scrubby or backward bird is removed to a separate pen. These culls are fed up for a week or so, then either given away or sold for a song to people who like a few hens in the back yard and are not particular about vigor or high production. For the commercial plant Mrs. Wise believes only the very choicest stock is good enough, and only the birds which show every sign of vigor and have never lagged for a moment are allowed to remain. The pullets are culled again when they go into the laying house, and the flock that begins laying in September is as perfect as care and culling can make it.

(Continued on Page 246)

POULTRYMAN'S CALENDAR—SEPTEMBER, THE CULLING MONTH

While it is true that in a sense every month is a culling month, and while the use of lights during the long winter nights often causes a molt at the wrong time, nevertheless, September may be called the culling month. Now is the time to cull by color, separating the birds with yellow shanks and bright, glossy plumage from the ragged, faded layers which have not yet finished the year's work. The bird with shrunken comb and dull eyes may safely be removed from the flock, and those which show by their bright color that they have finished molting can be put in the doubtful pen and tested out.

September is also an excellent month for hatching if the spring hatch has been short or if market birds are desired. Reds, Rocks or Wyandottes hatched in September make wonderful growth and are ready for frying by Christmas or for roasting by February when they bring the year's best prices. They may be raised in fireless brooders or by hens, 25 chicks to a hen, and are raised with less effort than at any other season.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Moldy Hay

I ordered baled hay guaranteed to be first-class. Upon opening several bales I found that it was wet and blue with mold. The outside of the bales had dried so that there was no indication of the interior condition. I refused to accept the hay and have notified the seller to remove it but he has paid no attention. I again notified him, saying that I would have it hauled to the warehouse. Could he require the warehouse people to deliver the hay without paying charges? Could I collect storage for the time it has been in the barn? Are my proceedings lawful?—Subscriber, Hemet.

Even without the warranty that the hay was first-class the law requires a warranty in the case of provisions that the seller by the sale warrants that they are sound and wholesome. The buyer at all times has a right to inspect a thing sold and may rescind the contract for breach of warranty. By rescinding the contract the situation is as though no contract had been made. In an instance such as this where the property has been delivered the prospective purchaser would become a depositary and liable only for his negligence concerning such property. A depositor, that is to say, the seller of the hay, would be required to pay to you all expenses incurred, such as reasonable value of the storage in your place. If the hay comes in actual danger of perishing you may sell it for the best price obtainable and keep the proceeds in lieu of the deposit. Upon your giving reasonable notice to the owner to remove the hay and the owner failing to do so within a reasonable time you are entitled to sell the hay in order to satisfy your lien for storage. It will be unnecessary for you to haul the hay to a warehouse for storage, as in such instance as above it would doubtless be that the hay would not be worth the price.

Subdividing Property

If I subdivide a tract of land and cause streets to be graded and dedicated to the county, can I charge the purchaser for land to the centers of the road?—Subscriber, Walnut.

If the streets are in fact deeded to the county they cease to be the property of the owner. The usual method in such instances is, however, merely to grant a right of way. In such instance the original owner owns to the center of the street. However, when a person sells property he may, of course, put any price on the property he may see fit and can induce the purchaser to pay.

Water Company

I bought property, including water shares in a certain well. After the purchase a mutual water company notified me to pay charges. The lot had a two-inch outlet. Now the water company requires me to reduce it to a one-inch outlet. Can this be done? The agreement of sale provides that the source of water supply is a certain well located on a specified lot in the tract, to which the lot sold to me is entitled to one share, which share shall perpetually be appurtenant and shall remain as a part of the land when sold.—Subscriber, El Monte.

As regards the rights of the water company, it would seem that there necessarily would be a monthly charge for the upkeep of the water plant, which would be equitably divided among the parties obtaining water. You should know that it invariably costs something to operate a water plant, and no seller could reasonably sell and give water forever free of charge. As to the change of outlet, that would seem to be a different matter, but an examination would necessarily have to be made of the by-laws of the company in order to ascertain if there is any right to make this reduction. It may possibly be, upon examination of the whole transaction, that you have a right to rescind the contract of purchase.

Loses Citizenship

When an American woman marries a foreigner does she give up her citizenship?—Subscriber, Lodi.

Congress has enacted a statute which provides specifically that any American woman who marries a foreigner shall take the citizenship of her husband. At the termination of the marital bonds she may resume her citizenship. If abroad, she may resume her citizenship within one year by filing declaration to that effect with a consul of the United States or by returning to reside in the United States, or if residing in the United States at the termination of marital relation, by continuing to reside therein. This act has been held to be constitutional and a valid enactment by the supreme court.

PACIFIC COAST NURSERYMEN ELECT

At the Nineteenth Annual Convention of the Pacific Coast Association of Nurserymen held at Seattle these officers were selected:

President, Henry Evarts Weed, Beanerton, Oregon; vice presidents, F. W. May, Yakima, Washington; C. D. Hobbs, Milton, Oregon; Carl E. Wright, Kimberly, Idaho; A. W. Wagner, Pasadena; Frank Walton, Salt Lake City, Utah, and Richard Layritz, Victoria, B. C.; trustees, J. J. Brownell, Seattle, Washington; S. A. Miller, Milton, Oregon, and F. A. Wiggins, Yakima, Washington; executive secretary, C. A. Tonneson, Burton, Washington.

OREGON PRUNE PRICES

Opening prune prices of the Oregon Growers' Co-Operative Association for the 1921 prune crop, bulk basis, were announced last week at 10¾c for 30-40, 9¼c for 40-50 and 7¼c for 50-60, and 6¼c for 60-70.

The prices average about 5 cents lower than the opening quotations of last year. The association estimates the Northwestern crop at 22,000,000 pounds this year.

FESTIVAL OF DATES

J. Win. Wilson of the Coachella Valley is appealing for help in making known to the world the greatness of the date industry. To that end the people of the valley have staged a festival of dates to be held in the Coachella Valley, where dates grow, October 21-23.

A date growers' institute will be in daily session, cultural and harvesting questions will be discussed, and there will be opportunity to get complete information regarding the date industry in America. It is expected that 18 or 20 experts of the department of agriculture will be in attendance.

Southern Manitoba, in common with North Dakota, has suffered from extreme heat coupled with unusually dry weather in July. As one proceeds northward conditions improve, but entire southern section from Red River to western boundary, except some fortunate localities, must be satisfied with light wheat crop average, about ten bushels. Wheat cutting practically complete, threshing general. Support is lent to theory that corn belt is moving northward by many excellent fields of corn, and silos are making their appearance in what was once exclusively wheat country. Hay crops and rye good.

Tulare County's horticultural commission is keeping up its fight on squirrels.

FROM A KODAK NEGATIVE

They are *your* Pictures

It is when the picture shows something that *you* are interested in, that *to you*, it becomes worth while. You do not, perhaps, care anything about taking pictures (though many people think it great fun) but the pictures themselves you do care for when they are of people or places or things that are yours or that you are interested in.

There's a personal, human touch in pictures of your home, your children, your broad meadows and your fine cattle. There's interest to you in pictures that tell the story of your auto trip, your camping party or of the picnic where your children had so good a time.

It is because such pictures have the personal appeal that, in millions of homes, the snap-shot album has become the most thought of book in all the house.

Picture taking is very simple with a Kodak or Brownie, and less expensive than you think.

Ask your dealer or write us for the 1921 catalogue of Kodaks and Brownies. It's free.

Eastman Kodak Company Rochester, N. Y., *The Kodak City.*

Figs: Supplies liberal. Market weak. Locals: Per box 1.00@1.50; poorer 50@75.

Grapes: Supplies liberal, movement slow, market weak. Wide range in quality. Thompson Seedless 3@4; Muscats 4@5; black varieties, 5; fancy Hamburg, 5½@6; Tokay, 9@10.

Peaches: Supplies heavy. Demand moderate, market firm. Freestones mostly 90@1.10, few fancy 1.25@1.50, poorer 60@75, Clings 90@1.00, few best 1.10@1.25; poorer 50@60.

Pears: Demand and movement good, market firm, Bartletts mostly 5; few fancy 6; poorer 3@4 per lb.

Plums: Supplies light, market dull. Satsuma plums 4@5 lb.; Kelsey, 4@5; prunes, various varieties 3@5.

Quinces: Lug, 1.00@1.35.

Watermelons: Supplies very heavy. Demand slow, market weaker. Locals: Klondikes mostly 1 per lb., few 1¼; poorer ½@¾ per lb.

CITRUS FRUITS

Grapefruit: Supplies liberal, movement moderate, market firm. Local: Per box, market pack, 2.00@3.00, mostly 2.50@3.00.

Lemons: Supplies liberal. Demand moderate, market weaker. Local: Market pack mostly 3.00@3.50; loose box mostly 2.00@2.50; poorer, 1.50; lug 65@75.

Oranges: Supplies moderate. Demand moderate, market firm. Market pack 3.00@3.50, small sizes 2.25@2.75, loose pack 1.00@1.50, mostly 1.00@1.25.

GRAIN AND FEEDS

Grain Exch. price bid August 30:
Barley: 100 ton lots, 1.65.

HAY

Alfalfa Growers of California report:

Movement very light. Demand slow but steady and prices show hardening tendency.

Present prices are still so very unsatisfactory to growers that all those who are able to hold back are doing so, and the others do not market more than absolute necessity compels. Heavy production is about over; ordinarily this is also the period of stocking up by users and dealers, but this year very little of this has been done. This puts on the growers the burden of carrying their hay until it is needed for consumption, a task so far beyond their financial strength that it brought about the present ruinously low prices.

The situation is a good deal the same as prevails in other principal farm products, and to relieve this situation congress has now given to the war finance corporation authority to give to farming interests credits up to a total of a billion dollars for the moving of the crops. While these credits are for the present to be used only for the purpose of facilitating exports and therefore are not available to us, prospects are very favorable for prompt credit assistance also being extended to us through other channels.

Growers are paying power companies as high as $2.50 an acre for a single irrigation in many localities in the San Joaquin, an excess rate at the very time they are in the most unfavorable position for meeting it, and if they cannot meet it promptly, and the power is shut off, they loose the benefit of the later much lower rate and, of course, they also lose the later cuttings.

We have taken this matter up with the heads of one of the big power companies who explained that they are compelled to make the graduated charge as they would lose money if the charge to the growers of grain, etc., who use the power only for one or two irrigations in the early part of the season, were made at the same average rate as to the customers who use the power all through the irrigation season.

It would seem to us that this rate schedule could be changed so as to be more favorable to the alfalfa growers while at the same time protecting the interests of the power company, but for the time being we have to take the situation as it is. We therefore asked the companies to be more lenient with our members in enforcing the shutting off rules. They explained that their delinquencies are already increasing at a disquieting rate and would be bound to increase still more rapidly if they were to stop enforcing their rules with our growers generally. They are willing to consider individual applications for extension of payments, in special cases recommended by the association, with its assurance that the respective grower is able to and will soon pay the bill with the proceeds of his hay when sold. We have no doubt the power company will be as accommodating on this basis as it is possible for it to be under existing conditions, as it of course does not want to cut off any of its revenue that it can help.

There were 700 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending August 27, with 240 tons held over.

Prevailing prices last week f. o. b. Los Angeles:

No. 1 Dairy	19.00
Standard Alfalfa	15.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	20.00@24.00
Standard	16.00
Straw	8.00

San Francisco Markets

San Francisco, August 30, 1921.

Wheat: Milling, 1.90@2.00; feed, 1.90 @2.00.

Barley: Feed, 1.20@1.25; shipping, 1.25 @1.42½.

Oats: Red Feed, 1.30@1.50.

Corn: California yellow, 1.50@1.55; No. 2 Eastern, in bulk, 1.50@1.57; do, No. 3, 1.50@1.55; No. 2 kaffir, in bulk, 1.65@ 1.70; do No. 3, 1.65@1.70.

Citrus Markets

Los Angeles, August 31, 1921.

Many Valencia packing houses have finished on their season's output and are closed. They are still going out, however, around 100 carloads daily. Market conditions rather easy.

The lemon situation is very favorable to the grower though the season for spectacular sales seems to be over.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California, Oranges, 35,924 cars; lemons, 10,062; total, 45,986. To same date last season: Oranges, 27,809; lemons, 7,380; total 35,189. From Central California to date this season: Oranges, 6,644; lemons, 212; total, 6,856. To same date last season: Oranges, 5,377; lemons, 289; total, 5,666. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 23; total, 284.

ORCHARD MANAGEMENT STUDIES IN TULARE COUNTY

(Continued from Page 231.)

of water applied at each application has been approximately the same on the two blocks). This is another example of the danger of growing summer covercrops where a thoroughly adequate water supply is not assured. Despite the need for organic material, it should not be grown in the orchard at the expense of the constant and liberal water supply for the trees.

Our work on the tillage of the adobe soils has been continued with some definite conclusions and other suggestive observations. Those who have followed this work realize that we have attempted to compare several radically different methods of culture in the hope that some one or more might prove particularly effective and practical. The first of these methods to be relegated to the discard is the growing of alfalfa on alternate middles between the trees. We had hoped that this deep rooted legume, grown on less than one-half the land at any one time, might prove of benefit in opening up the soil. The injurious effect on the trees was, however, so plainly shown in a dropping of foliage and general yellowing of the trees that, at the end of the second year, the treatment is to be discontinued. Numerous cases are on record where alfalfa grown in every middle in mature orchards has been injurious, but it had been thought that with alternate middles clean cultivated the competition, or the toxicity, or the whatnot, would not be too great. Such was not the case, however, and hereafter we will feel justified in condemning any practice of growing alfalfa in a mature orange orchard.

The plots upon which summer covercrops have been grown and the plots covered with a summer mulch of straw have no outstanding developments that warrant either rejection or advocacy of these treatments. They will, therefore, be continued until they give more positive account of themselves.

The surface soil on the plots tilled almost entirely with a plow has continued, throughout the two years, to maintain the best physical texture of any in the experiments. Our moisture determinations continue to show that there is a better penetration of irrigation water on the plots so handled which we believe has definitely been to the advantage of the trees. Certain it is that the trees on these plots are in splendid vigor, although the production has not yet increased as much as might be desired. It will take at least another season to demonstrate whether or not this practice is conducive to heavy fruiting. It may be, also, that the constant plowing will eventually form a serious plow-sole condition. This does not seem to have occurred as yet.

When the condition of the soil, the vigor of the trees, and the amount of fruit set are all considered it seems that nothing has yet clearly surpassed the standard treatment of fall planted covercrop with plowing in February or March, followed by deep summer cultivation. Very careful attention has been paid, however, both to the time and the depth of cultivation, and to this attention we lay the marked improvement both in tilth of soil and condition of trees on these plots as compared to two years ago. Certain growers have, in the past, cultivated their soil when it was too wet, which practice is particularly injurious to adobe soil in the hot summer. Also, much so-called cultivating has in reality been nothing more than surface tickling which tends rather to pack the soil than otherwise.

Just as deep and timely tillage is proving of advantage on the adobe soil, so we believe it will on the other types of citrus grove soils in Tulare County. Our observations convince us that there has been far too much shallow cultivating, too much wet cultivating, and even too much too dry cultivating on all soil types throughout the county.

In brief, then, the key-words to the successful care of orange groves in Tulare County would seem to be consistency and thoroughness. Consistency in fertilization, in pest control, in the application of water, and in tillage; thoroughness in tillage, in irrigation, in pest control, and in fertilization.

QUESTIONS AND ANSWERS

(Continued from Page 238.)

vator if enclosed leaves are Cory or Burbank blackberry. — Subscriber, Lankershim.

The leaves are from the Burbank. They are flat, fairly smooth, slightly notched on edges, not more than two inches long or more than an inch wide. But the most marked difference is that the Burbank leaf is almost white on under side while the Cory is a clear green beneath, but little paler than on the upper surface. The Cory leaves are much larger, coarser, larger notches in edge, ruffled, not flat, almost grape-like in general appearance and green on both sides.

In order to get an unbiased opinion we wrote to E. W. Jamison, Ontario, who grows, or has grown, heavily of Burbank, Cory, Mammoth and other berries. Mr. Jamison says: "The Burbank, if heavily pruned, will bear after the second year only. The berry is small and round and uncertain as to maturity. I would hesitate to recommend it as I do not think it would pay commercially. On a recent trip to and through San Diego County I found a great deal of complaint about it and can find none who say it does well or makes good berries. In Santa Barbara I recently saw vines which had been well pruned and taken care of, but the results were not very good, so I am satisfied it is time and money wasted to plant them in the south end of the state. They may do better in the north.

"The Cory is like the Mammoth in most respects, though it is a little larger around, a little firmer and a little more tart. It is, I believe, a little better in all respects than the Mammoth and if picked before getting too ripe is a good shipper for short distances. The only objection to the Cory is that an occasional shoot has thorns. I have three vines now with thorns on all canes, but only three in a one-acre patch. These I shall dig out and the occasional thorny shoots I prune off."

PLANTING AND CARE OF SUB-TROPICALS

"Citrus and Tropical Fruit Trees, a Monograph on Planting, Culture and Care," a book of nearly 70 pages and filled with color plates and half tone illustrations is the newest and most valuable addition to information on history and culture of sub-tropical fruits in California. The R. M. Teague Nurseries of San Dimas are the publishers of the book which treats on the principles and practices of citrus and tropical fruit culture from the nursery tree to the full bearing orchard, together with timely suggestions on harvesting, packing and marketing, based on 33 years' experience in California. In a way the book is an advance salesman for fruit trees but it is far more than that in the fund of information which it contains on production of nursery trees and more on planting and culture.

The color plates are excellent in showing form and color of Washington Navel, Valencia, Eureka lemon and Marsh Seedless pomelo. Also a new color plate giving the first look at avocados in natural color reproduction. This plate shows three varieties of avocados, the Puebla, Sharpless and Fuerte. That portion of the book given to sub-tropical fruits other than the citrus is mostly devoted to avocados but a bit of story and cultural information is given as to feijoa, cherimoya, sapote and different varieties of the guava. The book will be mailed by the Teague Nurseries, San Dimas, for 50 cents.

The Fall River and Hat Creek farm centers are sponsoring the third agricultural fair at McArthur, Shasta County, September 8-10.

Important to Bean Growers

The handling of beans with a side delivery rake is certainly the most practical and economical way to handle the crop provided the rake used is properly built and properly geared for the handling of beans.

In the ordinary side delivery hay rake the cylinder is speeded entirely too high for beans. When the cylinder runs at a high speed the beans are handled so roughly that a great many are threshed out of the pods and lost. The Thomas Side Delivery Bean Rake is especially geared for the handling of beans. The cylinder moves much more slowly than it does in a hay rake.

Dixon & Griswold at No. 130 North Los Angeles Street have in stock the Thomas Side Delivery Rakes geared especially for beans and also have them in stock geared for hay. They are offering them at a special price of $100.00 each f. o. b. any railroad point in California or Arizona. Your dealer can easily get a Thomas for you at this special price. If there is no dealer in your section you can order a rake yourself by 'phone. The telephone number is 62825 Los Angeles.

Let us have your name and address and we will mail new Price List when printed

Geo. C. Roeding, Pres.

Fancher Creek Nurseries

Fresno, Cal.

FOR JUST THREE REASONS

We propose to stage the greatest Bargain Sale of first class Nursery Stock ever offered in California.

REASON I

We desire the people of Southern California to become acquainted with the fact that we have the largest variety of fine ornamental and fruiting plants to be found within the borders of the State, and, we thoroughly believe, the United States.

REASON II

We have to make room for our large stock of fine plants now growing on RANCHO POMOFLORA and at Colorado St. and Hill Ave.

REASON III

We have the ambition to build up here in Pasadena one of the greatest nurseries in America and for our expansion we can use to advantage a few thousand dollars.

To convince you that we mean business we are going to offer, beginning September 1, any or all of the stock in our lath-houses on the south side of Colorado St. at Hill Ave., at just

HALF PRICE

Here are some of the bargains; all our fine 75c Roses, including such varieties as "Ophelia," "Hadley," "Sunburst," "Columbia" and many others at 40c for one, or two for 75c.

AVOCADOS

We have a fine stock of budded "Fuertes," "Spinks" and others. Any $5.00 tree at $2.50. We will have a nice lot of thrifty budded trees that will go at $1.50 each.

You will find our regular retail price marked on each block of stock, and 50c on the dollar takes any of it. In addition we will have a large block of stock somewhat overgrown that you can have at 25c on the dollar, or less.

This is strictly a Cash Sale and no deliveries will be made of orders under $10.00.

This sale price does not apply to our wholesale department on the north side of Colorado St., nor to any stock now growing in the field. The sale will continue for two weeks, or until we have realized what we have started out to do. Business hours 8 to 5. No orders at sale prices will be taken over the telephone and no replacements will be made.

wherever motor cars travel on boulevards, mountain grades or country roads, in dry or wet weather

REMEMBER THE HORSE SHOE TREAD

The Built-in-Endurance of Horse Shoe Cords has been proven by the long mileage they give and their dependability under the grueling test of rough use on country roads.

The Horse Shoe tread wears smoothly and evenly with seldom a blister or blow-out. And mileage records show a lower cost per mile in almost every case.

Come in and we will give you a demonstration. We want you to know why more than a million motorists recommend Horse Shoe tires.

Old Olive Trees at Mission San Diego

THE first olive trees planted in California were at the San Diego Mission. This photo, taken by R. R. McLean, gives a view of some of them. Mission is shown in the background.

Early historical records show that in 1769 Jose de Galvez, commander of the two ships bearing the colonists who founded the Mission San Diego de Alcala, imported various fruit and vegetable seeds from Mexico and planted them at the mission here. It is assumed that among these seeds were those of the olive, for olive trees grew up around the Mission, and in after years cuttings from them were secured by the padres and planted at the other missions as they were built, and in this manner the "Mission olive," as it is still known, became established all over California. In fact, until about 1880 this was the only variety with which Californians were familiar. A very strong proof of the origin of this variety from seeds lies in the fact that, like the Mission grape, the Mission olive has not been identified with any old world variety, although undoubtedly of European origin.

Among the olive trees at the Mission San Diego some of the old palms, presumably planted at the same time, are still flourishing.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

One of the best things apparent at the state fair is the interest in various county and other fairs. Many of the exhibitors, especially those of pure bred stock, are planning for the circuit as soon as their stock is released. In fact, several strings have come here from the Santa Rosa fair of last week.

* * *

O'Connor says regarding that North of Bay Counties Fair at Santa Rosa that it proved a distinct surprise to the home folks. They knew Sonoma County was able to produce fruits, vegetables, farm crops and pure bred livestock, but few realized that she has done it so perfectly as was shown at that exhibition.

* * *

One of the drawing cards at the fair is the Speedway. It's an honest-to-goodness "fastest on earth." Here's the proof: "110.84 miles per hour." This is nine miles better than previous records.

* * *

Nor was the racing confined to the realm of gas, for the ponies at the fair just ended hung up a record of 1:43, while the trotters fixed upon 2:14 as the right figure.

* * *

One of the most notable features at the state fair is the force of experts from the state university, ready to give information on carburetors, transmission, oiling and greasing, or any other problem of the power farmer. Tractor parts are there in all stages of tearing down. The inquirer is quickly shown the working mechanism of his type of tractor or of one so closely allied that it is exceedingly informative. The objection to this exhibit, or rather school, is that it is located in about the most remote part of the grounds.

* * *

Professor Fletcher is in charge of the school, and he suggested that: "The success of any machine depends to a very large extent upon the ability of the operator to properly care for it. With this in mind, we have arranged to demonstrate in this school tent the common repair operations on tractors and trucks, such as bearing fitting and adjusting, ring fitting and valve grinding, together with such other work as magneto care and timing, carburetor adjustment, lubrication information, etc. It is intended that those people desiring information concerning the repair or care of their automotive equipment ask the instructors to show them how these various jobs should be done. In other words, it is to be a 'cafeteria' school. Naturally, all instruction is free and there will be nothing for sale in this tent."

PRESIDENT HARDING COMPLIMENTS CALIFORNIA AS LEADER

A wire from the President to Director Hecke at State Fair, Sacramento, says:

"California has led not only the nation but the world in the highly valuable and important work of standardization and distribution of fruits and vegetables. There could be no better testimony than the California fruit and vegetable industry which is a monument in a broad way. The entire agricultural interests of the nation are certain to profit greatly whenever these methods can be extended throughout the world. This is the most perfect possible marketing."

SAVE TAHOE

Nevada is trying to get Lake Tahoe. California is saying quite loud: "NO!" Its waters are, of course, very valuable for Nevada lands, but California has proven the wonderful value of its greatest asset—beauty. And the idea of taking away this beautiful lake and leaving only a mud hole is almost sufficient to cause civil war. However, we think there is no occasion for being heated up at all, for Director of National Parks Mather is wise to the entire situation.

D. B. MACOUN

One of California's doers of things, D. B. Macoun, died recently at his home in Willows, Glenn County. Mr. Macoun was one of these hard working men who felt that duty called for his remaining at his post and working quietly, so that his circle of acquaintances may not be as large as some, yet he was loved because of his dependable work and whole-hearted friendliness.

He was a native of Canada, came to California in the early eighties, lived in Riverside as superintendent of the Arlington Heights Fruit Company's orchard properties. A dozen or more years ago he went with Mr. Mills to Glenn County to superintend the work in the Mills citrus orchards. His passing was as quiet as his life, and only by merest accident we learned of it a few days ago.

MORE COOPERATION

President Howard of the American Farm Bureau Federation has appointed a committee of 21 to serve as a Farmers Fruit Marketing Committee. This committee is to be instructed to evolve a plan whereby the fruit producers may establish and conduct cooperative fruit marketing organizations.

The committee will include the following: W. B. Armstrong, Yakima, president Washington Farm Bureau Federation; Sheridan W. Baker, Santa Rosa, chairman horticulture department of the California Farm Bureau Federation; A. E. Johnson, Grand Junction, Colorado, president Mesa County Farm Bureau; W. S. Keeline, Council Bluffs, Iowa, National Horticultural Congress; C. I. Lewis, Salem, Oregon, manager Oregon Growers Cooperative Association, and R. S. Peters, Devore.

Baker and Peters are live wire Californians. Something doing if the others are as well qualified.

GAMBLING

The country has been generally gratified by the fact that "the biggest gambling institution on earth," the pit at Chicago, has been brought under at least a measure of control by a recent action of congress. Thousands of other smaller institutions are maintained which unfortunately are giving to our children ideas which may lead to bigger gambling institutions in the future. We refer to the fortune wheels, dice, and a thousand and one other features in our parks and at various pleasure resorts. We had occasion nearly a year ago to refer to a similar state of affairs at the state fair that year—nearly 100 of these institutions were given a most prominent place on the grounds and were surrounded almost continually by crowds of men, women and children, gambling for kewpies, Teddy bears, hams, canary birds, in fact every form of merchandise, and especially attractive playthings which caught the eye of children. We believed the tendency entirely wrong for an educational institution, and the state fair is an educational institution.

The conditions were appreciated by the people of Sacramento, and this year the city council made enactment, putting an embargo on all wheels of fortune and purely chance gambling schemes. This has greatly reduced the number of these institutions, but there are still a score or more operating under the guise of "Games in which Skill is Required." Instead of simply watching the wheel of fortune stop on the lucky number, or usually the reverse, now either Dad or Mother must throw a baseball and strike the nigger baby or toss a ring over the knives or knock down a certain number of ninepins, or perform other "skillful" operation. Slightly less objectionable, but teaching the same lesson.

With the host of high school clubs and school children from every section of the state invited, and attending, the state fair, let us give to them the most wholesome lessons. It can't be done with these loud barkers calling their wares, to secure which involves a lesson in gambling.

MOVE THE CROPS

The other day we stood on the wharf in San Francisco and saw coming from the hold of a vessel just in from Hong Kong and Yokohama many an eight bale derrick load of raw silk. We were told those eight packages contained somewhat over $8,000 worth of material, each bale weighing 133 pounds, and the entire shipment was valued at over four millions of dollars.

The steamer was a fast one, chosen by the shipper because of that fact, and alongside it had been run the express cars which were to convey the raw product to the eastern manufacturer. It was to remain on the San Francisco wharf but an hour or two and was to go through to New York on express time, which it was hoped would not exceed five or six days. It required many cars to handle the entire shipment.

The occasion for the haste was simply the saving of time and money. Owing to the great value of the shipment, insurance rates and interest on investment were of greater import than express charges. The sooner delivered, the sooner the handlers were released from responsibility.

It occurred to us that therein was a lesson to the farmer in handling his crops. We have known of farmers who never seemed to consider marketing or disposal of the crops until harvest time. In fact, many seem to plan purposely to delay marketing. Many such farmers are paying large sums in interest and sometimes in storage, besides losing in shrinkage, and, if wise, are keeping their products insured. These expenses eat bigger holes than one realizes and they should expedite marketing operations.

SAVE THE WATER AND POWER

A very active campaign has just been started to further California's water and power act. The act is a proposed constitutional amendment to make possible the use of state credit in order to supply power and water to ourselves at cost. The committee organized to advance the interests of the state through this measure is composed of:

William Kent, Kentfield, chairman; Dr. John R. Haynes, Los Angeles, vice-chairman; Rudolph Spreckels, San Francisco, executive director and treasurer; Dr. Horace Porter, mayor of Riverside, secretary; Clyde L. Seavey, city manager of Sacramento and former manager of the state board of control; L. L. Dennett, state senator from Modesto; William Mulholland, Los Angeles, builder of the Los Angeles aqueduct; William J. Locke, secretary of the League of California Municipalities, and city attorney of Alameda; Esto Broughton, assemblywoman from Modesto; Mrs. Anna L. Saylor, assemblywoman from Berkeley; J. L. Matthews of Los Angeles, member of the state water commission; Louis Bartlett, mayor of Berkeley; Franklin Hichborn, publicist, Santa Clara; Mrs. Herbert A. Cable, deputy labor commissioner, of Los Angeles; C. W. Koiner, city manager of Pasadena.

Headquarters will be opened in San Francisco; other offices in Sacramento, Los Angeles and Riverside.

This certainly is far more patriotic—likewise sensible—than to join in the campaign made by large hydro-electric interests to prevent communities from securing these power and water rights. Apparently the present effort will lead to various communities of the state uniting in securing use of the power and water at cost of providing them.

One of the forces combating this effort to secure power and water at cost—in order to finance its campaign—is offering exceptionally long interest rates on stock sold to its patrons, ourselves. Payment of this high interest rate outwardly comes from the company doing the developing; we all know that it comes from the consumer.

California Cultivator

Vol. LVII, No. 11 Los Angeles, September 10, 1921 One Dollar Yearly

Sixty-Seventh Annual State Fair

Editorial Correspondence

IT'S a boys and girls fair, that is, it's educational, and some of us must confess that boys and girls are more eager to take advantage of these opportunities than we who may be a bit older. Today, Opening Day, high school clubs have been contesting in judging of cows and of calves, and girls have been showing their handiwork in almost every conceivable way in the educational building. Educators have been meeting at the University of California headquarters and discussing how they can keep up with the demands of these bright youngsters. Besides the Boy Scouts have drilled, have saved one of their own number from drowning, have taken poles which, with their coats, have made stretchers, and carried off the "dead," and all round it has been a girls' and boys' day.

And this is all occurring on the river of the Holy Sacrament, the river which pours out its wonderful blessings on a large portion of the great central valley. It is the state fair, the sixty-seventh since the one which was first held in 1851. I cannot say, yet, as to how great will be the observation of the anniversary of the state's birth, which will be on Friday, the 9th, when we are promised fine attendance. It is thought, however, that Monday next, or Labor Day, will be the banner day in attendance.

Charlie Paine is somewhat of a pessimistic optimist. I asked him this morning as to his hopes of attendance, and he seemed rather blue and remarked: "Well, I am $90,000 in the hole now; I don't know where I will be by the end of next week." But the crowds are coming very satisfactorily, and Monday's and Friday's attendance will go a long way toward pulling him out of that hole.

It is hardly probable that last year's big record will be equaled. That was the biggest ever and may stand for some time as the top notcher.

President Jastro, and Directors Borden, Bull, Delorey, Dudley, Franklin, Harvey, Mitchell, Perry, Pierce, Ramsey and Roeding are all on the ground, and with coats off. However, let me say right here that Sacramento climate is outdoing itself this year, the weather is simply perfect, and of course the Sacramentans are saying, "This is just as we always have it," to which we all agree.

As to the exhibits the headlines of the local papers are using largely of superlatives. We note: "California's Wonder Pageant," "Gifts of Nature to a Wonderful State," "Great Abundance of Natural Wealth," "Amazement at the Wonderful Exhibits." And I believe I may say that the arrangement and the wealth of the products as shown in the main or Horticultural Building have not been excelled at former fairs.

Turning to the right as we enter the Agricultural Building, we find Yolo County in her old time location with, of course, Fred Shaffer in charge. Fred vouches for there being 80 varieties of grapes in his exhibit, and we confess Yolo is some grape county. Besides, of other fresh fruits there are 75 varieties, and I may add that a whole lot of them are plums, for there certainly is a magnificent showing of plums. Of pears there are some 21 or 22 varieties, and 16 of peaches. There is an exhibit of Eureka rice, said to ripen three weeks or more sooner than the ordinary early variety. Then there is ramie and a still larger exhibit of hemp. Hemp is but little planted in California but an experiment farm in Yolo County is proving its worth and possibilities under irrigation, and the time may come when California will consider this humble member of the nettle family one of its great assets. Not only is the plant shown in all stages from the green and immature plant, but some of its products are shown, and in addition a bulletin issued by G. William Schlichten is freely distributed, giving the results of Mr. Schlichten's many years' experience in growing this fiber. A striking feature of Yolo County's exhibit is a monster safe lettered "Yolo is a Safe County."

Alameda County is next. Alameda has a novelty in a great book, the leaves of which are of monster cardboards on which the sign painter has written in some of the great productions and things accomplished by that county. Ed Stearns is one enthusiastic believer in that county and he has a mass of information regarding Alameda's diversified crops, two great cornucopias pouring out a wealth of, may I say hundreds, of products, and I say correctly, for there are by actual count 244 varieties of fruits and vegetables. Of the summer squash there are some specimens that will provide meals for a family for weeks. Immensity is not the only qualification, for Mr. Stearns assures me their quality is in every way equal to their size. The biggest exhibit of chestnuts on the grounds is in this exhibit.

Calaveras exhibits little of interest to agriculture, though there are a number of fine apples and vegetables. Her great showing is of minerals. Calaveras is one of the greatest gold producing counties in the state, but she is featuring more particularly asbestos. Within her borders are some eight million tons of asbestos rock, and a company is now opening up the veins and contemplates adding to California's productions one which is produced nowhere else in the United States. Our principal supply now comes from Canada.

Occupying its usual place at the far southern end of the building is the California state department of agriculture. This is too important an exhibit to attempt to describe after the once over, so we will speak of that more at length in another issue.

Down through the center of the great building are exhibits by the U. S. bureau of public roads, the division of forestry and many counties. The division of forestry has one of the most artistic and realistic exhibits in the building. It's a combination of fine art in the background, with real animals and the greenery of the mountains. At least one-half of the picture is of green growth while the other half represents only the sere and brown of trees and plants devastated by fire.

Next comes the Almond Growers' exhibit, artistic, exquisite and, I may add, decidedly appetizing. The usual plate glass cases and cut glass jars are filled with almonds in shells and in almost every conceivable manufactured form, but there is one glass case by which we all stood and looked longingly. It is filled with almonds in the form of all kinds of confections, made from almond paste, from broken nuts, from chopped nuts. There are creams, there are hard candies, there are fancy pastries, there is even an almond pie, a monster 16 or 18 inches in diameter and said to be a particularly choice edible in southern France. This exhibit is under direction of David Bailey.

Next door is Riverside County, G. A. Packard in charge, with Mr. Baxter featuring the Sunni-Hunni exhibit. Raymond Cree is in charge of the dates, and that date tree is perhaps the most prominent exhibit in the whole building. It is an 18 year old Coachella Valley seedling with 15 monster clusters of ripening dates. The tree was taken up bodily, and these great clusters of dates strapped to braces fastened to the tree, and the tree, perhaps 20 feet in height, set on flat car and shipped nearly 600 miles. The clusters of dates are estimated to weigh about 120 pounds, and valuing them at $1 per 12 ounce carton, which some of Coachella Valley's finest dates are sold for, one gets an idea of the sacrifice made by Coachella Valley people in sending this one plant as an educational feature to this state fair.

Fresno always puts up one magnificent exhibit. 1921 exhibit is no exception. Naturally raisins make the greater portion of it, although the real raisin exhibit is in an entirely different section, up in the gallery, featured by the California Associated Raisin Company. But of peaches and table grapes she certainly makes magnificent showing. These, likewise, are given the advantage of an additional showing in the California Raisin & Fig Growers' exhibit, also in the gallery.

Then comes San Joaquin with a decidedly marine look to her exhibit. From the background is emerging a monster ship's prow, her decks laden with wool and other San Joaquin products. In front are great barges loaded to water's edge with products, principally fresh grapes. This is to feature particularly San Joaquin's shipping facilities—"We are on tidewater," and her great commercial advantages. This exhibit is in charge of C. C. Jensen.

Then comes the rotunda, and after that the exhibit of Placer County. Placer County has no old Spanish Missions, but she has a fine new one in this exhibit. She has appreciated the beauty of mission architecture and has worked it into her exhibit scheme perfectly. The center piece is a beautiful bird fountain, product of one of her clay products companies. In addition, there are large jars for plants, jardinieres and various glazed and unglazed clay vessels. Citrus fruits also enter largely into her exhibit, and the county claims greatest diversity in fruit production of any in California.

Next come the huckleberries. They are in the Mendocino County exhibit and are fresh, just from the bush. Everyone who has ever eaten huckleberry pie is likely to migrate to Mendocino County when he learns of her huckleberry possibilities. They are not cultivated in that county; they just naturally grow, and one little community known as Albion is the huckleberry center. While these huckleberries are growing wild either on public lands or lands which will not for a long time be brought under cultivation, they are known as huckleberry ranches, and by common consent of the huckleberry pickers the hillsides are apportioned by some sort of unwritten law to the different families, and every family recognizes and respects the rights of the neighbors to their particular "ranch." The automobilist passing through and gathering his "mess" for his own use is good naturedly tolerated, but should he locate and proceed to make permanent claim to that which for many years has been regarded as the "property" of another, he is soon made aware that he is incurring the displeasure of the entire community. The huckleberries are shipped by parcel post, some days two great auto truck loads of parcels being required to carry the mail to the nearest railway point. Then Mendocino shows 40 varieties of apples and innumerable other exhibits, most attractive of which are sections cut from great redwood trees. They are worth a story another day. The exhibit is in charge of Robert Austin of Ukiah.

Kings County shows monster dining room table. How many it will seat I don't know, but say 100, and it is loaded to capacity with peaches, apples, figs, apricots, grapes—but why mention all of California's products; they are all there. A back-east Thanksgiving time look is given to this exhibit by liberal use of corn and pumpkins.

Stanislaus County is featured by a beautiful grape arbor with pergola approach. Monster grape bunches hang in profusion and the background is sheaths of dozens of varieties of grains, with spuds, squash (one a yard long), melons, in fact, truck loads of all kinds of farm products.

Los Angeles County shows diversity of products, but the one central and big feature is a striking exhibit of her hydro-electric power system. Los Angeles carries her domestic water about 250 miles, or, say, as far as it is from San Francisco to Reno, Ne-

(Continued on Page 270)

Agricultural News Notes of the Pacific Coast

Northern California

The rice mill at Colusa is working day and night on last year's crop.

Several carload shipments of cattle were made from Livermore last week.

The territory about Oroville, Butte County, has 500 acres in bearing olive trees.

The wild plum crop of Sierra County is very light this season due to severe April frosts.

Tehama County hog auction at Red Bluff, October 21; Butte County, October 19.

A bulk rice and grain elevator is to be built two and one-half miles south of Willows.

The Almond Growers Exchange closed its membership roll for the 1921 crop on September 3.

An egg laying contest is to be a feature of the Tehama County fair to be held at Red Bluff October 3-8.

The Sonoma County fair held last week at Cotati was a thorough-going success especially in fruit display.

Russel T. Robinson of Marin County has been named farm adviser of Alameda County to succeed Mark Lee.

Shipment of 27,000 bags of paddy rice was made last week from the Sperry mills at Biggs, Butte County.

Napa County schools will have no "prune vacation" this year because there is ample supply of other labor.

Short courses in land colonization and settlement are announced by the University of California September 5-7.

County Horticultural Commissicner Flournoy of Tehama County says that he has found a way of controlling citrus blast.

A brisk demand for rice is reported from Willows, Glenn County. "After-rain" rice is being sold at 75 cents a sack; "pre-rain," $2.10.

The Sutter County farm bureau will hold a hog auction at Yuba City, October 18, in which it is expected that Yuba County will join.

Several shipments of eggs have been made from Petaluma to New York by way of the canal by the Poultry Producers of Central California.

The Pacific Rice Growers Association held get-together meetings August 15, Biggs; 16, Franklin Corners, Sutter County; 17, Willows, Glenn County; 18, Colusa.

The Eden Township Farm Products show at Hayward recorded an attendance of 30,000 for the four days of the show. The management is planning to make it a county fair next year and claim state aid.

Local meetings of the Tehama County farm bureau: Squaw Hill, September 12; Dairyville, 14; Corning, 15; Bend, 16; Liberal, 22; Bowman, 24; Los Molinos, 26. Directors meeting, Red Bluff, 24, 10:30 a. m.

At the recent annual meeting of the Pacific Coast Association of Nurserymen at Seattle H. E. Weed of Beaverton, Washington, was elected president. C. A. Tonneson of Burton, Washington, is executive secretary.

Browns Valley farm bureau fair, Yuba County, was held the last of August in a grove on Dry Creek. No buildings were provided to house exhibits but none were needed say the visitors as the grove was ample shade and shelter.

Central California

Kings County fair receives $817.50 from the state.

San Joaquin County fair will be held at Stockton, September 12-17.

Tulare Livestock and Agricultural Show, Tulare, September 13-17.

The Associated Raisin Company has announced prices on the new crop.

Hog auction sales in Kern County at Wasco, September 3; Bakersfield, 17; McFarland, 30.

Calf club exhibitors at the Patterson fair received awards of $10, $8 and $7 from the American Jersey Cattle Club.

Donald M. Smith has been appointed assistant county agent in Stanislaus. He will have special charge of livestock work.

A correspondence course on peach culture will soon be ready for sending out from the college of agriculture at Berkeley.

Prices for figs delivered at the Peach Growers Cannery at Turlock have been raised to six cents for first quality and four cents for seconds.

Many Turlock growers who are discouraged with this season's returns from cantaloupes are talking of putting in cucumbers next year.

Export to English markets of Fresno raisins has recommenced, more than 1,200 tons of Thompson Seedless being shipped in the last month.

Santa Cruz supervisors are taking up the case of fruit truckmen who are hauling heavy loads to Watsonville warehouses to the damage of the roads.

The Associated Raisin Company estimates that the raisin crop of the state will fall 40 per cent short of normal production. Severe April frosts are chiefly responsible.

Two of the large pumping plants of the Lindsay-Strathmore district north of Exeter, Tulare County, were burned last week. One hundred acres of pasture was destroyed in the fire.

Saturday, August 27, was Governor's Day at the annual Patterson fair, Stanislaus County, and the biggest day in point of attendance of all the fair days. The livestock parade was the main feature of the day.

Season tickets costing $2.50 and entitling the holder to admission every day are an innovation of this year's Fresno district fair, September 26 to October 1. These tickets will admit to the 150 mile auto classic race on Saturday with the additional payment only of the war tax.

Farm center meetings in Stanislaus County at Wood Colony, September 19; Keyes, 19; Sylvan-Claus, 28; Patterson, 22; Ceres, 22; Fairview, 16; Laurel Lodge, 26; Mt. View, 2; Hughson, 5; Jennings, 7; Tegner, 9; Denair, 12; Mitchell, 13; Valley Home, 14; Hickman-Waterford, 21.

The cut of one-third in raisin prices effective October 1, has resulted in sales of 16,000 tons, valued at approximately $3,000,000. Shipment of these will be made by 11 special trains, five of which have left Fresno for eastern points. This takes care of one-third of the 1920 holdover crop, while the success of the five cent package campaign is expected to make a considerable hole in the remainder.

Southern California

Carpinteria bean growers have commenced harvesting.

The Yucaipa Apple Growers Association expects to pack over 100,000 boxes of apples.

The park board of Pasadena has appropriated $250 for poisoning ants in the city parks.

The Ventura County chamber of commerce is embarking on an extensive publicity program.

Walnut orchards at Goleta, Santa Barbara County, have been in serious danger from forest fires.

The dove season opened the first of the month. Hunters are allowed 15 birds for one day's shoot.

The opening of the new highway has made the Salton Sea accessible to bathers who are enjoying salty dips.

The La Habra farm bureau held a meeting the first day of September to discuss possibilities of securing an insectary.

A recent meeting of the Associated Chambers of Commerce at Santa Ana, Orange County, criticised the county supervisors because of road work.

The Associated Chambers of Commerce of Imperial Valley are planning to attend Coachella Valley's date festival in an "automobile caravan."

The Festival of the Moon held by the Tejunga Valley in Los Angeles County was held the first five days of September with a big attendance.

The Anaheim Citrus Fruit Association will hold a meeting September 16 to act upon proposal to increase its capital stock from $50,000 to $200,000.

Six carloads of Muscat grapes were shipped from Rialto vineyards one day last week. It is expected that 150 carloads will be shipped out this season.

The El Cajon district of San Diego County shipped its first grapes east on August 16. The crop will be about 60 per cent of last year's crop of 154 cars.

Horticultural Inspector Hodges of Covina is experimenting in excluding ants from citrus trees in order to protect parasites brought in to subdue scale.

The San Bernardino County farm bureau has been working to secure reduction in power rates for growers and packing houses. The entire county will be canvassed.

It is proposed to open up the Santa Barbara national forest as a resort to be known as Frazier Mountain Summer Recreation Ground. The proposed park will take in 25 square miles.

Because of some complaints of increase in rates and discontinuance of service the railroad commission has ordered investigation of service of the Whittier Water Company, California Domestic Water Company and La Habra Water Company.

The fall semester of the southern branch of the University of California at Los Angeles opens September 13; registration of new students, September 8 and 10; former students, September 12. In addition to the work of the junior college and the course leading to elementary teachers' and special certificates four year courses for teachers are now being established.

The Coast and General

Washington's peach crop is estimated at 25,000 tons; pears, 30,000.

A good roads association has been formed in Coos County, Oregon.

The annual hog and dairy show at Banks, Oregon, will be held, October 6-8.

Colorado reports demand for feeder lambs from Eastern states.

Grain sorghums in Arizona have been greatly benefited by recent rains.

Wireless telephones are used by the United States forest service in Idaho reserves.

The station of the weather bureau at Phoenix reports abundance of water on ranges.

The Oregon prune growers are placing on the market a prune bar similar to the fig bar.

Spokane, Washington, Valley orchardists expect to ship about 1,400 carloads of apples.

Sunflowers are popular for silage with dairy farmers of Wallowa County, Oregon. A thousand acres have been planted to this crop this year.

Recent heavy showers in Arizona have removed fears of grass shortage. It is said that the range in many open sections resembles a meadow.

Clarke County, Washington, potato growers have formed a cooperative association and will market through the Washington Growers' Packing Corporation at Seattle.

More than 100 Lake County, Oregon, ranchers and stockmen attended the second annual field demonstration recently. Twenty-eight cars made tour of fields examined.

The largest prune crop in years is predicted for the Walla Walla Valley of Washington, approximately 1,500 carloads. Many growers have contracted to sell at $50 a ton.

Nut bearing trees for highway planting are recommended by the Good Roads Association of Michigan, especially the black walnut because of its timber value and rapid growth.

Apple growers of the Wenatchee Valley, Washington, have a cooperative organization with a membership of 500 growers controlling 4,000 to 5,000 carloads of fruit. It markets under the "Jim Hill" brand.

J. M. Rodgers of Wellington, Colorado, has been elected president of the state farm bureau to succeed W. G. Jamison, whose duties as member of the legislative committee of the American Federation require his presence in Washington, D. C.

Director Fawcett of the wool marketing department of the American Farm Bureau says that 2,000,000 pounds of pooled wool moved the last two weeks of August. Fine and medium staple brought 28-30 cents; half-blood staple, 26-28 cents; three-eighths staple, 23-25 cents; quarter-blood staple, 21-23 cents; low quarter, 16-18 cents; braid, 12-14 cents.

According to a recent decision of the Washington Growers' Packing Corporation, an organization which represents 90 per cent of the Clarke County prune acreage, pickers will be paid 6 cents per box, with a 2-cent bonus for staying through the picking season. Kiln keepers will be paid $5 a day while common labor will receive $3 per day. Ten dollars will be charged for drying, which is just half of what it was last year.

Pruning Citrus

By R. W. Hodgson

THERE is probably no horticultural operation about which more dogmatic advice has been given than pruning. Among growers as well as investigators there is still much diversity of opinion, and every degree of severity in pruning practice from no pruning whatever to absolute butchery is still to be found in the citrus orchards of California. This situation is due primarily to the fact that fundamental investigations of pruning have only been undertaken during recent years and the principles involved are not yet sufficiently clear with most fruits, and particularly the evergreens, to make it possible to codify them, much less to originate systems of pruning based upon them. It is also attributable to the rule-of-thumb methods which have been used so largely during the past half century in the pruning of all classes of fruits, without any inquiry as to the reasons why various cuts were made and the responses which followed the treatments given. There are a few general principles which the grower would do well to bear in mind in regulating pruning practice. These are principles of plant physiology and apply to all trees and plants. The details of application naturally vary for different plants and with evergreens, such as citrus, are not the same as with deciduous.

General Considerations

The greater part of the plant is composed of carbon which is secured from the carbon dioxide of the atmosphere taken in through the leaves, where in combination with water absorbed by the roots, in the presence of sunlight, starches and sugars are formed, these furnishing the main source of food for the elaboration of the living substance. If the plant is to grow normally and vigorously there must be a large actively functioning leaf surface. This is the reason why severe pruning, which accomplishes too great a reduction of leaf surface, is especially objectionable to evergreen trees. The result is starvation. Citrus growers are now generally agreed that it is easier to starve a tree by severe pruning than by failure to furnish fertilizers.

The most recent researches on plant nutrition indicate that there is an important relationship between nitrogen intake through the root system and carbon intake through the leaves, in the determination of the amount of fruit borne by the trees. If the nitrogen intake is below the normal the trees will be found to be unhealthy and unfruitful. If the nitrogen intake is abnormally large, vegetative growth and again unfruitfulness is the result. If the carbon intake is low vegetative growth and unfruitfulness result, while if the carbon intake is large, other things being equal, the plant is found to be healthy and fruitful. Pruning therefore partakes of the nature of a change of environment insofar as it regulates the carbon-nitrogen ratio.

The present attitude of the best growers toward the pruning of citrus trees may be expressed in the statement recently made by one of our most prominent citrus experts, "I prune my trees with hesitancy and regret." This should not be construed, however, to mean that citrus trees do not profit from pruning. We hear little of the "Let Nature have her way" sentiment in these days of scientific horticulture. While our old sweet seedlings may have developed into fairly satisfactory trees with but little attention, our budded varieties most certainly require pruning for the production of maximum crops.

In California fruit trees are naturally fruitful, due to the large amount of sunlight which they receive, tending to the production of abnormally large quantities of carbohydrates. The unusual prevalence of bright sunshine, with our tropical evergreens is not an unmixed blessing. In an effort to protect themselves our trees have a tendency to grow very thick and dense. In so doing they exclude sunlight from the interior at the expense of fruit bearing. It must be remembered that the leaves manufacture carbohydrates only in the presence of sunshine.

Pruning for Production

Upper: Upright shoots on good branch, "riders;" mechanically weak and undesirable. Navel orange.
Middle: This vigorous upright has the key to the pantry. It should be taken out bodily. Navel orange.
Lower: Headed back lemon tree one year from pruning.

Practical citrus growers agree on about three reasons why citrus trees require pruning. Under favorable soil conditions, with adequate irrigation, citrus trees if unpruned are likely to grow too large for economical orchard handling. Fumigation costs are among the most important factors in costs of producing citrus fruits. It costs a great deal more to fumigate a large tree than a small one. And by proper pruning it is possible for the medium sized pruned tree to carry as much fruit as the large unpruned tree. The same applies to spraying. In practically all citrus districts the trees require frequent spraying and annual or semi-annual fumigation. It should also be borne in mind that the picking of citrus fruits is an expensive operation since the fruit must be clipped, in the case of lemons using a ring. It is therefore desirable to grow trees from which the fruit can be harvested without too great expense. All of which renders it desirable to have medium sized rather than large trees.

If citrus trees are unpruned it is well known that they become so dense as to cease carrying fruit on the interior. Interior fruit is usually of better quality than exterior fruit so that it is of importance to secure as large a crop on interior fruiting wood as possible. The growth of healthy fruiting wood in the interior of citrus trees may be secured only by judicious pruning whereby the trees are opened up sufficiently to permit light to enter.

Normal citrus trees may and frequently do produce vegetative and fruiting growth. In the former class are sucker wood, white wood, etc., vigorous and sometimes not very fruitful, almost certain to gain the ascendancy in competition with the slower growing true fruit wood. They are weak mechanically since they are of rapid growth, long and spindling, and made up of large cells with thin cell walls. Altogether these types of growth must be considered as undesirable.

The injurious results of severe pruning of citrus trees have been emphasized by a number of our best informed growers and have been mentioned previously. It has been rather conclusively shown that severe pruning of normal, healthy citrus trees is repressive, resulting in less fruit and smaller and weaker trees than where the trees are not pruned severely. There are instances, however, where the wood is old and decadent, where severe pruning is not without its beneficial effects. Such cases, however, are for the expert to judge and are by no means the rule.

One other practice, more or less common in the pruning of citrus trees in the past, and which has been shown to be injurious, is the heading back or "stubbing." Heading back results in accentuating length growth, the three or four buds below the cut being forced into very vigorous vegetative growth. This is wasteful of the energies of the trees and results in growth which is mechanically weak and has to be cut out later.

The object, then, in pruning citrus trees should be to prevent them from becoming unduly large, to keep out all undesirable vegetative and mechanically weak types of growth, and to maintain the trees in a reasonably open condition so as to encourage interior fruiting.

The Young Tree

The first requirement is to head the trees correctly. Unfortunately, the grower usually has little to say in regard to this matter, since the trees come from the nursery with the heads already established. In all too many instances but little attention has been given to the formation of the main framework. Usually the scaffold branches are allowed to come out at approximately the same point. When trees of this sort reach mature age some of the branches are certain to be caused to decline on account of crowding. The usual height to which citrus trees are headed is from 28 to 32 inches. It is desirable to have the main framework branches distributed over the upper 12 to 15 inches. Whenever two branches grow out from one bud one of them should always be removed. All shoots which put out from the lower 15 or 20 inches should also be removed.

After planting the main object is to encourage the young tree to take hold quickly and to develop a large bearing surface as quickly as possible To accomplish this end it is necessary to have a large leaf surface, for the trunk and root system are nourished by the leaves. It is therefore clearly inadvisable to severely prune young citrus trees and ordinarily the only treatment necessary is that of rubbing off suckers or water sprouts from the trunks of the trees and cutting out specially vigorous upright shoots which seem likely to dominate the rest of the branches. It is best to take such branches out before they have reached large size, so that during the first year or two it is desirable to go over the trees at least every two months.

All the pruning the trees require during the first few years may be done with the thumb and first finger. If this system is followed the trees should have reached good size and be ready to come into fairly good bearing by the fourth year. From this time on a little more pruning is required since the trees have now reached sufficient size to have considerable interior bearing surface which must be kept fruiting by opening up the outer shell of foliage.

The Bearing Tree

The navel orange and grapefruit are similar in their habits of growth and require about the same pruning treatment. They are inclined to be ball shaped and very dense in growth. At least once a year they should be gone over and the outer shell of foliage either thinned uniformly throughout its entire surface or holes made here and there.

Growers vary in their opinions concerning the proper method of permitting light to enter but all agree that light must enter if fruit is to be borne there. All specially vigorous upright shoots should be carefully removed as these are undesirable and for the first few months of their life are truly parasitic.

The Valencia orange and lemon are somewhat different in habit of growth from the navel orange and grapefruit. They are much more upright and of a more vigorous nature, hence they require somewhat more pruning in order to keep in shape. The Valencia is so vigorous a grower that unless

"My Motorcycle and I"
(By a New York State Farmer)

"In April, 1920, I got a new Harley-Davidson motorcycle with side car, and it has been in service every day I have had it.

"I have taken my milk to the station every day, four cans at one time, and three times every day. I also take the eggs to the station three times a week, two and three cases at once, and also draw all the feed from the mill.

"In fact, our horses have been off the farm but very little since I got this machine. It takes the place of a big car at so much less expense.

"No one would ever imagine what a valuable thing on a farm a machine like this is. In the ten months of hard service that this machine has had, it hasn't cost me one penny for repairs.

"The Harley-Davidson will stand the banging, take it from me, and I cannot speak too highly of it."

Yours very truly,
(Signed) FRED C. ACKER,
Central Bridge, N. Y.

The Harley-Davidson's 50 miles for a dollar—gas, oil and tires—is real economy these days. Let us show you how a Harley-Davidson can pay a farmer big dividends.

PRUNING CITRUS

(Continued from Page 257)

carefully watched during the first few years it is almost certain to develop a framework which is decidedly weak and which under the heavy fruiting which is characteristic of this variety requires either propping or bracing by wires. The prevalent mistake made in handling the Valencia is in permitting too many framework branches to develop, the result being crowding and long weak shoots which, after they elongate and carry fruit on the ends, are subject to much breakage. Not more than six main framework branches should be allowed to develop the head of the trees. To secure this result rigorous thinning will be necessary during the early years.

This same situation obtains with the lemon. In the past it has been the custom to prune lemons much more severely than other citrus trees and there have grown up a large number of so-called methods of lemon pruning all of which may be reduced to about three systems.

The first, and now the most common and also the most in accord with our knowledge of the physiology of the citrus trees, is the so-called Englehart system. In this system all vigorous types of growth are eliminated and the tree formed of the slow growing, rather pendant, small leaved fruiting wood. This system requires a minimum of pruning and since the leaf surface is not reduced to any appreciable extent it encourages maximum fruiting. It is essentially the system outlined above under general principles.

Another system much used in the past but now losing ground is the so-called Fleet system. This is a combination of heading back vigorous upright growth for the formation of framework branches, together with selection of the best type of growth produced as a result of the heading back. This system, if rigidly followed, will produce good trees which bear satisfactory crops. It is a costly system to practice, however, as it requires that the trees be pruned regularly twice a year. It is also wasteful of the energies of the trees since vigorous upright growth is encouraged only to be cut off at the next pruning.

The third system has no particular name but in reality consists of no pruning at all except cutting off low hanging branches when they begin to get in the way in cultivation. As mentioned above this system produces very large trees of very loose and weak framework formation, and is not a reasonable system for California horticulturists to follow in the light of our information concerning the needs for pruning citrus trees.

It formerly was the custom of many lemon growers to arbitrarily decide upon a certain height above which the tops of the trees were sheared off exactly as a hedge is trimmed. This system, being a purely mechanical one, as might be expected proved unsatisfactory. It is now practically abandoned in all districts. The result of this system was to encourage a very vigorous, dense growth on the tops of the trees at the expense of fruit farther down.

Bud Selection and Pruning

In a very important sense the pruning of citrus trees should begin with the selection of buds for propagation. It is well recognized that the best strains of our standard varieties are those which require the least pruning. It will undoubtedly be true that as our orchards are topworked to the better strains and as the new orchards planted with trees propagated from selected buds come into bearing, the pruning problem will decrease in importance.

These selected strains do not have so great a tendency to produce coarse, vegetative growths as do the poorer strains which are now all too prevalent. It is therefore of the utmost importance, not only from the standpoint of yield, but as well from the point of view of reducing pruning to a minimum, for growers to insist on the planting of trees propagated from the very best selected buds.

Disposition of Prunings

If prunings are to be hauled out and burned they should be removed to some distance. Citrus trees are extremely susceptible to injury from the heat of fires. In a country such as California, where humus forming materials are scarce, it is wasteful to burn prunings. They should by all means be chopped up fine and plowed in. On many of the large ranches power choppers run by gasoline engines are drawn through the orchards, the prunings being chopped up where they are, followed by plowing under.

Pruning Tools

The saw in most general use by citrus pruners is one which originated in Japan and is a pull saw with a blade 8 to 12 inches long, the cutting edge of which has a decided curve to it. There are many types of this saw on the market at the present time, of which the Tyler and Bonita are perhaps the best. One of the best saws for use in citrus orchards is known as the California Pruning Saw with reversible blade.

A satisfactory outfit for the citrus tree pruner may be enumerated as follows:

1. A short, light stepladder.
2. One pair strong leather gloves.
3. One pair hand shears (Reiser pattern preferred).
4. One Tyler pruning saw.
5. One California pruning saw (six extra blades).
6. One pair lopping shears with riveted wooden handles.
7. Bucket of wound compound with brush for dressing large wounds.

Wounds and Dressings

All large limbs should be sawed off close to the trunk of the mother limb in such a way that new bark will grow over the cut surface from all directions. Stubs are a source of danger to the tree and reflect discredit upon the orchardist. In moist regions near the coast germs of decay are apt to gain entrance through wounds incident to pruning, and such decay extending into the heart of the tree soon brings about its decline. In the dry interior valleys the danger of decay is not so great, but wounds tend to dry out with constant checking of the wood. It is therefore wise, in order to encourage rapid healing over of the wounds, to protect all cut surfaces greater than two inches in diameter with some antiseptic dressing which will not only prevent decay but keep the wood from drying out.

The requirements for a satisfactory dressing are several. It must be comparatively cheap. It must also be rather permanent, at least not losing its effectiveness within a few weeks or months. Such a dressing must remain on the surface and not penetrate to any marked extent, and under our particular climatic conditions must have considerable elasticity in order to take care of large fluctuations in atmospheric temperature. Such substances as whitewash, lead paints, and varnishes or shellacs do not satisfactorily meet these requirements, since they soon dry out and lose their protective qualities. Grafting wax, while excellent in many respects, at present prices for beeswax is expensive.

Probably the most promising class of available materials is of those with asphaltum base. Asphaltum roof paint has been used by some with good results. Grade D asphaltum, which is a liquid form, is popular among some growers. A liquid preparation made by dissolving asphaltum in gasoline or distillate is recommended by certain authorities. Boiled coal tar has been used somewhat in the past and there are a number of commercial preparations on the market used to a certain extent. Probably the best dressing for the purpose is still to be worked out. There is much need of further study along this line.

The important thing, however, is for citrus growers to recognize the importance of treating all wounds of an inch or more in diameter and to make certain that all such wounds are well coated with some dressing which is renewed occasionally as needed, as determined by frequent inspection.

Railroad men have estimated that it will require 30,000 cars to handle crops of the Walla Walla Valley this season. 27,000 cars will be required for the wheat crop; 1,600 for the apples.

The pear crop of the Hood River district of Washington is estimated at 110 to 120 cars.

FRESH FIG SHIPMENT

Fig growers are much encouraged over successful shipment and sale of fresh figs in Eastern cities. The Fig and Olive Journal comments: "It is a little early yet to attempt to measure the effect of these first tests on the fig industry. It would appear at this time as though the fresh shipping of figs might rapidly develop into an important branch of the fig business, in which event the grower will have a much wider outlet for his fruit than before and correspondingly a more profitable market. With the fresh fig eagerly sought after in the East at remunerative prices to the grower, the great plantings of figs made in the past four years in the San Joaquin Valley will quickly come to have an established value, and a high one at that."

The new Sykes paper pack has been a very important factor in the success of the shipments and the California Peach and Fig Growers has this season held a number of demonstrations of the new pack.

VEGETABLE AND FRUIT SHIPPING SCHEDULES

Of general interest to all shippers of perishable products are the following schedules of fast fruit trains on the Southern Pacific to eastern markets:

Vegetable and green fruit trains from Roseville to Chicago through Ogden, 154 hours; Brawley melon trains, 153 hours to Chicago, 50 to El Paso; Colton vegetables, deciduous fruits from Southern California, 154 hours to Chicago, 53 hours to El Paso; Turlock melons, 166 hours to Chicago; Yuma vegetables to Chicago 141 hours (handling Imperial Valley and Coachella Valley vegetables and fruit from the San Diego district); Oregon fruit from Roseburg to Roseville, California, 48 hours. (Oregon cars re-iced at Roseville and placed in the fruit block which moves every few hours.)

PROFIT MAKING GRAPES

The Coachella Valley is each year adding fresh proof that she produces early table grapes of exceptionally fine quality and profit. Amongst the favorites are the Malaga and Dattier. One of the small vineyards on the place of Messrs. Cardwell and Petty, southeast of Coachella, made sales from July 11 to July 18. On July 11, 91 crates of Malagas were sold in New York, bringing to the grower $473.50. Freight, packing house charges and commissions amounted to $207.47, leaving net $266.03. On the 12th shipments of Dattiers and Malagas totaling 50 crates netted $115.16. A 94 crate shipment on July 18 netted above all packing and shipping expense $174.02. Another shipment of Dattier netted $60.05 for 36 crates.

Mr. Petty summarizes some of the facts connected with these shipments, which were made through cooperative marketing associations, as follows: 237 crates marketed through association, average $2.35 per crate, net returns 9.8 cents per pound (24 pounds in crate. 237 crates shipped east, 5,688 pounds, cost for packing, freight, refrigeration and commissions $510.72, nearly 9 cents per pound. 273 crates grown on 790 vines, five years old. Vines set 8 by 12, 453 vines per acre. 790 vines is almost 1¾ acres. $618.93 net return from 1¾ acres is $353 per acre.

TULARE CITRUS PROBLEMS DISCUSSED

Friday, August 26, was a very profitable day for the citrus growers of Tulare County. The many problems incident to producing fruit on the so-called "dry bog" adobe soils were discussed from every angle by the two men who know most regarding these problems. Prof. R. S. Vaile, of the citrus experiment station at Riverside, and Gordon Surr, who has spent the past two years in Tulare County studying conditions there first hand. The meeting took the form of a traveling conference, the growers first meeting the university men and County Farm Adviser Connor at Lemon Cove where fertilization and irrigation experiments have been under way for two seasons. Practically every feasible method of handling a grove has been tried out on this block of trees, and some of the results were readily apparent to every one present.

After covering each of the plots of this grove carefully the party journeyed to the Captain Anderson grove east of Lindsay where Mr. Surr has been making careful moisture determinations in cover cropped and clean cultivated blocks of the same grove.

In the afternon the party again met, this time in the Plano district south of Porterville, and heard an interesting field talk on the work of covering trees with muslin to determine effect on the June drop. It is interesting to note that the covering apparently had no effect on June drop but did practically eliminate thrips injury. On the same grove careful irrigation records have been kept and various methods of fertilization tried out. At eight o'clock a meeting was held in the new Strathmore union high school. This meeting was so well attended that the regular assembly hall was crowded and it was found necessary to adjourn to the school auditorium.

Two papers were given at this meeting, one by Mr. Surr which discussed the question of excessive lime in the "dry bog" soils of Tulare County and its effect on citrus trees. Professor Vaile's paper covered in detail the work of the two seasons in Tulare County, giving valuable suggestions to growers as to how they might get their soils in such shape that they will permit normal moisture penetration and aeration.

SULPHUR TO SAVE RAIN DAMAGED PRUNES

Professors Cruess and Christie of the state college of agriculture are continuing this season their experiments to determine the best methods of preventing rain damage of prunes. They have found that partially dried prunes can be saved by being placed in fumes of burning sulphur in ordinary sulphuring boxes for about one hour while freshly dipped prunes require only one-half hour of sulphuring to prevent moulding during the rainy weather.

CORRESPONDENCE COURSES

Correspondence courses on citrus fruits, semi-tropical fruits and others are now being offered by the college of agriculture. All these courses are described in Circular No. 113, which may be obtained from Division of Agricultural Education, College of Agriculture, Berkeley.

A Real Orchard Plow for Small Tractors

THE John Deere No. 8 Orchard Tractor Plow has special advantages that every user appreciates.

Reversible Hitch permits setting the plow to either side for close work in throwing either to or from the row. Note the illustration at the right.

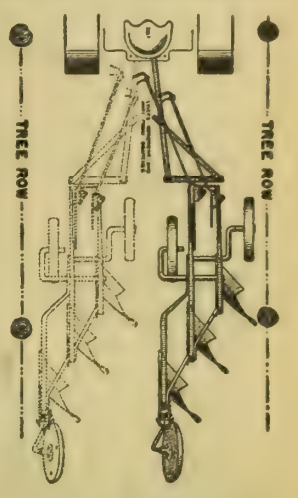
Levers can be angled in when the plow is set to either side—they are always within easy reach from the tractor, out of the way of branches and free of the tractor wheels, when turning short.

Levers set low when the plow is at work.

Doesn't scar trees—note the wheel base design which permits close work without scarring trees—land wheel set inside line of third beam; furrow wheel set inside line of inner moldboard wing.

Simple, positive power lift; great range of adjustment for deep or shallow plowing; unusual clearance; bottoms that insure good scouring and pulverizing, and strength throughout to stand the strains.

Just the size for small tractors—three ten-inch bottoms—pulls light. Can be reduced to two bottoms by removing one beam, bottom and brace, and using a short connecting rod furnished as an extra.



Tell your John Deere dealer to show you this plow. Remember, John Deere implements and repairs for western territories are kept in stock by John Deere branch houses at San Francisco, California; Portland, Oregon; Seattle and Spokane, Washington, and Boise, Idaho. These branch houses and John Deere dealers in every farming community insure quick and satisfactory service.

Write today for a free booklet describing the No. 8 fully. Address John Deere, Moline, Illinois, and ask for Booklet OP-76.

McQUAY-NORRIS LEAK-PROOF REG U S PAT OFF PISTON RINGS

In every size and over-size up to 5 inches

The largest sales in our history have made it possible to lower the price of the genuine Leak-Proof Piston Rings to below pre-war price.

Can you afford to have poor piston rings wasting power and gas when your repairman or dealer can supply genuine Leak-Proof Rings for $1.25 each — with Supercyl Rings for the top grooves at $1.00 each?

For those who want a lower-priced installation—a one-piece ring—nothing in the low-priced field equals the Jiffy-Grip Ring. It has an improved "non-butting" joint, and its velvet finish "seats in a jiffy."

All McQuay-Norris Piston Rings are made of the famous McQuay-Norris Electric Metal.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Property Restrictions

The deed to my property contains restrictions that if a building is erected within ten feet of the boundary or liquor sold on the property it will revert to the grantor. Is this binding and can I sell property without such clause in the deed?—Subscriber, Live Oak.

Such restrictions are entirely valid if coupled with the proper provisions made in the deed as to time of duration and provisions for the re-entry of the grantor. They constitute an encumbrance upon the property, but a deed of the grantee holding under such restrictions may merely recite that property is subject to restrictions and reservations of record.

Release from Trust

A conveyance contains a statement that the described real property is released from the terms of the trust deed made by first party to second party for a third party and that said property is reconveyed to first party, release being without prejudice to the security afforded by the real property described by the trust deed and on the release. What does this mean?—Subscriber, Live Oak.

The method of securing indebtedness by means of a trust deed is somewhat different from that of mortgage; in a trust deed the real property is deeded or conveyed to a trustee to hold in trust for the performance of the matters recited in the deed of trust by the party who conveys the property, who is termed the trustor. In case the party does not perform his agreements, such as in the usual case, the payment of the moneys recited in the note, for which the trust deed is secured, then the trustee executes the trust by making sale of the property. If the trustor does perform, then the trustee conveys the property described in the trust deed back to the trustor. In the above stated case, evidently a portion of the property conveyed was reconveyed under a provision that upon the payment of a certain amount some particular described lot would be reconveyed, leaving other property subject to the trust deed.

Hen House Near Dwelling

How near a dwelling house may one build a hen house? How many feet from the road is he required to build it?—Subscriber, San Gabriel.

There is no general law covering the above matters. They may, however, he controlled by city ordinances.

Wife's Checking Account

If a wife has no checking account in her own name, should she have the privilege of signing her husband's name to checks?—Subscriber.

A question such as the above is not within the province of this department as there is no law concerning such matters of domestic arrangement.

Wife Liable

In 1905 I gave a note for two years with my husband. He represented to me that the money was to be used for the purchase of a home and the property purchased was to secure payment of the note. He signed a paper to this effect to the lender. He never purchased the lot and took the money thus obtained, together with other moneys, and went away. Later I secured a divorce. I have been lately notified that suit will be brought against me on the note. Can collection be made?—Subscriber, San Jose.

Whatever the fraud from a legal standpoint it would be available only to the lender, and it undoubtedly would be true that the wife in the above case would be obligated to pay the note. However, it appears that the note matured in 1907. The statute of limitations would run out in 1911 so that the note is undoubtedly barred, and if action was commenced and the statute of limitations were pleaded, you would be exempted from any payment.

Support of Step Children

I was a widower with two children and married a widow with two children. Since marriage my wife's two children have inherited an income of $44 each per month. Can I be forced to pay for the support of these children?—Subscriber, Live Oak.

You are not legally liable for the support of these children even if they had no separate income. Having such income, it would seem that you are neither legally nor morally liable to them.

Farm Name

What is necessary to do to secure the exclusive use of a fictitious farm name? If, having obtained such name, I should use this fictitious farm name in making out checks, would it be construed to be doing business under fictitious name?—Subscriber, Los Angeles.

There are several means for the registration of such names, one of the least expensive of which is that provision set forth for the registration of farm, ranch and villa names. Under the act any farm, ranch or villa owner may upon payment of one dollar to the secretary of state have the name of his farm, ranch or villa registered in the register which the secretary of state shall keep for such purpose and shall be furnished with a certificate, setting forth the name and location of the farm and name of the owner. Any other person who shall use such registered name is guilty of a misdemeanor. This act is probably in the nature of a trade-mark, which can be placed upon the products of the ranch. It hardly seems that it would entitle a person to actually conduct business under the fictitious farm name. In order to conduct business under the fictitious farm name, a party must file with the county clerk a certificate, stating his name in full and place of residence and publish said certificate once a week for four weeks in a newspaper published in the county. The only penalty for failing to file and publish this certificate is that any person doing business under such fictitious farm name who has not filed the certificate can maintain no action upon the contract made or transaction had under the fictitious name. Any party desiring to avail himself of the registration of the secretary of state in making any contract or transaction could make such in his own name. He could then bring action upon the contract. Thus it has been held that a party who made a contract in a fictitious name, signing his own name as proprietor, was entitled to maintain action.

FAIRY TALES

I smiled at little Johnny,
Who fairy tales believes,
And at his childish fancy
Which such a tale deceives.

And then an oil stock salesman
Came 'round the other day,
And when he was departing
He had my six months' pay.

—A. F. C.

Experience keeps a dear school, but fools will learn in no other.—Poor Richard's Almanac.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dividing Lilacs

When is the best time to separate lilac shoots from the main stalk for transplanting? Can a five year old rose bush be moved successfully? When is the best time?—Subscriber, Burbank.

Midwinter, or any time after lilac bush has become thoroughly dormant, will do to divide. Do not leave the job too late for sap begins to run very early in lilacs and bleeding should be avoided. A five year old rose bush may easily be balled and moved at any time except during the hottest weather or period of active growth. Stop watering it the first of August and move immediately after the first rain of autumn.

Cherries at Sunland

Kindly advise me through the Cultivator if Royal Anne and Black Tartarian cherries will grow in Sunland or Tejunga which is located about 15 or 17 miles from Los Angeles.—Subscriber, Yucaipa.

They will grow and make beautiful trees but we question very much as to any crop. Cherries are, as a rule, not a success under conditions which obtain in that portion of Los Angeles County.

Time of Freshening

We have a heifer that was bred March 27, 1921, and we would like to know when she will drop the calf.—Subscriber, Riverside.

The period with the cow is 283 days, which in this case would make the date of the cow's freshening January 3 Of course there may be slight variation.

Spotted Alfalfa Field

I have a field of young alfalfa that has large spots in it where the soil seems to run together and pack and consequently will not take enough water when irrigated to make it grow. There is very little humus in the soil and of course under these conditions the plants root down very slowly. I would like to know if liming these spots during the winter will tend to open the pores of the soil and relieve this condition without injuring the alfalfa in any way. If so, what kind of lime would be best to apply and how much would be a reasonable amount to use? — Subscriber, San Jacinto.

Here is opportunity to test out the value of dynamite or of subsoiling in opening up these hard spots. Under such conditions a subsoiler would call for a good big tractor or a half dozen draft horses, but we believe the plowing of this soil to a great depth is the only salvation. Then there could be worked into the soil coarse strawy manure through liberal use of disk harrows. Reseeding, say early in October, should be done, and then if March does not show a good stand, disking and giving another good seeding at that time should prove beneficial. Again, it is possible these are alkali spots, but if not too strongly impregnated with alkali the subsoiling will perhaps admit of sufficient drainage that heavy irrigation may carry down the alkali and you may get a good stand. Positive answer can be given in this case only after personal examination of the soil. If it is a case of hard adobe then the application of lime would prove beneficial. It would lighten up the surface soil, but even this may well be used with the heavy application of manure. We would prefer an application of finely pulverized limestone or the decomposed marine lime. An excellent article in both of these forms is now available. In case the spots are impregnated with black alkali an application of half a ton or even a ton per acre of gypsum would prove beneficial.

Garget

What is the cure for garget in a cow's udder?—Subscriber, Ferndale.

When cows are fed highly about calving time the blood is apt to be too thick and rich and that causes congestion of the udder. A week or two before calving a cow should be fed very sparingly and about that time given a dose of salts; that will thin the blood and they very seldom have any udder trouble. When the udder becomes very full of milk even before calving it should be milked out to relieve the pressure and this also will help to prevent congestion or inflammation. Congestion causes the milk to coagulate and come in lumps until the inflammation subsides. This is apt to recur at intervals. The remedy is to thoroughly rub the udder and milk it out clean regularly, also give salts in her feed to thin the blood. Mix three pounds of epsom salts with two pounds of common salt and give her a handful in the feed once a day for a week or two. If the trouble returns give her more salts.

Sunflower Seeds

We have nine acres of sunflowers and would like to know when they should be threshed to get the seeds. Should they be allowed to ripen on the stalk or be cut before ripe and dried?—Old Subscriber, Santa Ana.

Cut just before ripe or the seeds will begin to fall out. Dry for about one week, or until seeds are loose, and then thresh.

Planting Strawberries

I would like to know at what time of year it is best to plant strawberries to be able to get a crop next year. I would also like to know how many crops can be taken profitably from them.—Subscriber, Santa Maria.

If planted in February strawberries will yield a crop the first year from May to July. In frostless sections a few growers withhold water supply in late summer and get a winter crop, a crop wholly dependent upon water supply. Other growers in the same sections report planting in November and getting a light crop in March, this continuing into a normal May-July crop. But early February planting gives a crop as above, May-July. We presume your second question is in regard to years of bearing. This depends almost wholly on treatment given and is largely in the control of the grower.

Avocado Leaves

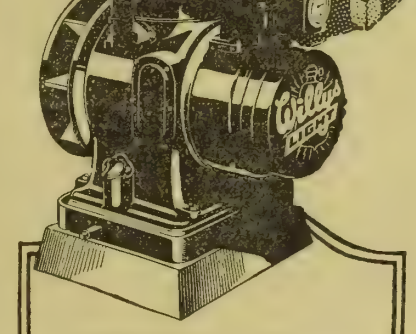
Enclosed are avocado leaves from seedlings eight months old, grown in hothouse and planted out two weeks ago. Please tell me trouble and remedy.—P. W. P., Los Angeles.

A close examination under a microscope failed to reveal anything organic the matter with the leaves. We must conclude the injury was due to sunburn or something wrong in care of plants.

Budding and Grafting

Please tell me when to bud and graft; I know how, but am a recent arrival from Ohio.—F. S. Los Angeles.

Grafting is usually best done in early spring, but in this sub-tropic clime there are many plants and trees that may be grafted at almost any time with a reasonable assurance of success. Budding is done from early spring to June. The latter is a favorite month for spring budding of



Willys Light Proved Mechanically Perfect

Mechanically Willys Light is built with the precision of a watch and the sturdiness of a tractor. The engine generator unit is simple, compact, reliable, efficient and economical. It is made up of a Willys-Knight, sleeve-valve, air-cooled engine, a direct connected generator and a simplified control. All moving parts are enclosed.

The Willys Light battery is of large capacity (240 ampere hours) assuring long life and abundance of power and light. It consists of sixteen cells of the sealed glass jar type and is ready for use when you receive it.

The air-cooled Willys-Knight engine burns kerosene, gasoline, gas, distillate or alcohol. There are no belts, no chains, no magneto, no radiator, no geared fan, no water pipes, no switchboard, no exposed terminals, no carburetor, no grease cups, no springs, no valves. The Willys Light is semi-automatic—is self-cranking and self-stopping. Has only one place to oil and can be operated by a woman or child.

In all, the Willys Light can be depended upon to furnish constant, ever-ready, efficient power and light service for your farm—any hour or all of the twenty-four in a day.

There is a size to fit your needs—as much or as little power as you may require.

California Farmers, Listen! Willys Light Pays Its Own Way

Time has given the **proof.** Every farm can now have all the advantages of electric light and power, because every farm can now afford Willys Light.

Take the word of men who **know**—who live right in your own state—who speak from **experience.**

Every Willys Light user in your state is **satisfied**—and **more**—with his investment. These men **know.** They have found profit as well as comfort and convenience. They will tell you they would not think of doing without Willys Light. Ask them. We will send you their names.

They will tell you there is no longer a question as to the practical utility of electric light and power—that Willys Light is the most needed addition to the American farm today—that it will give more actual returns and raise the standard of your home higher than any other assistance you can employ.

Willys Light is not a novelty—not an imitation of city luxury—not an untried, unproved invention. It is built for **constant, reliable, lifetime, practical electric service** on your farm at the convenient touch of your finger—with **no more personal attention for care and operation than you give to any other good farm machinery.**

Economical—Practical—Reliable

Willys Light pumps the water for house, barn and garden—runs the cream separator, corn sheller, grindstone, fanning mill, churn and washing machine—at less cost than the very cheapest labor. And there is light in the sheds, the barn, granary and garage for work or chores. And in the house there is the cheery, steady, wholesome illumination that makes the home happy—also the conveniences for wife and mother that make life worth living on the farm.

No matter where or what the size of your place, you should get complete Willys Light information and free estimate at once. There is a size to fit your farm—as many or as few lamps as you wish—as much or as little power as you need—**at a price to meet your requirements to your profit.**

Telephone or call on the Willys Light dealer in your locality, or write to us for free catalog and illustrated information circulars today. Address Dept. 78 .

citrus trees. October and November is the favored time for fall budding. The buds lie dormant through the rainy season and develop in spring. Again, some trees are budded at almost any time except during the three or four coldest months.

Strawberry Troubles

I am sending specimen of diseased strawberry plant and with it sample of surrounding soil. The plant comes from a field set in March. Until several weeks ago all were in a healthy condition, but then in different parts of the fields plants began to wilt in the crown and dry up. The roots also decayed. I water them twice a month. Could that be too much for them at this time of the year? Or is it the soil condition? — Subscriber, Riverside.

No fungus or other disease is apparent. We believe your plants may be getting too much water, but not often enough, especially if they were planted on ridges. Strawberries need frequent light irrigations. Heavier and less frequent waterings will not suffice. You may have alternate stagnation of water and drouth. Your soil shows considerable alkali and this may be a contributing factor, though strawberries are quite tolerant of alkali. Heavy irrigations but twice a month may bring alkali to the surface each time and allow it to dry about stem of plants.

Quinces

Would you kindly advise me as to cultural requirements of the quince, soil and climatic, and as to its use as root stock for Bartlett pear? Any suggestions would be appreciated.—Subscriber, Mountain View.

Quinces need rich soils, but not wet soils. The trees are known as shallow rooters, therefore cultivate lightly but frequently. Climate is not a serious factor. As the trees are dwarf, 15 feet apart is a good planting distance. The roots are used for dwarfing pears and for this use the Angiers stock is best, though any will do. Quinces are notoriously slow-growing, gnarly trees and one must be patient in caring for them.

Himalaya Blackberry

Regarding the following description of my Himalya berry plants can you inform me why they are not producing satisfactory results? The plants are about seven years old, have been pruned each year at correct time and also have been irrigated sufficiently Up until last year and this season they have had a good crop of berries, and have yet, but the present crop only ripens half way, leaving the top of the berries a bright red, which never ripens, and of course this condition keeps us from being able to sell any of them.—Subscriber, Sunnyvale.

It is quite possible for your berries to come to normal production yet. They should fruit from now to Christmas, or until frosts catch them. We know of nothing that would cause such conditions as you describe. However, as you have had present vines for seven years it may be necessary to root new ones and reset. This we certainly would do if fruit continues to remain immature.

Worms in Cat

Please inform me how to get rid of worms in cats. The worms are a flat white worm about an inch long, and seem to cause the cat considerable annoyance.—Subscriber, Van Nuys.

Have your druggist prepare the following: Pulverized areca nut, 2 drams, made into 12 powders. Give one powder in a little milk every morning. Also get ten 3 grain tablets of santonin and give one every night.

Tb. Testing

To whom shall I apply to have my cow tested for tuberculosis?—Subscriber, Porterville.

Apply to your county veterinarian at Visalia.

Potatoes in the Moon

Is there any truth in the old theory of planting potatoes in the light or dark of the moon?—Subscriber, Porterville.

The department of agriculture has made most careful trials with planting various crops in both the light and dark of the moon and has announced it can determine no material influence of the different phases of the moon on plant life.

Ant Powder Kills Diabrotica

Sometime ago I read a rather despairing reply to some subscriber about killing diabrotica. I've tried lead arsenate, blackleaf 40, etc., with no appreciable results. Only recently they have been swarming to the electric lights and I've used ant powder, and it surely does the work.—Subscriber.

THE FEW

The easy roads are crowded;
And the level roads are jammed;
The pleasant little rivers
With the drifting folk are crammed.
But off yonder where it's rocky,
Where you get a better view,
You will find the ranks are thinning
And the travelers are few.

Where the going's smooth and pleasant
You will always find the throng,
For the many, more's the pity,
Seem to like to drift along.
But the steeps that call for courage
And the task that's hard to do
In the end result in glory
For the never-wavering few.
—Edgar A. Guest.

LUCY BARNHILL'S GARDEN

By J. Grace Walker in Youth's Companion

ABOVE the continuous din of half a dozen sewing machines and the accompanying clatter of tongues a single sentence reached Mrs. Wiersema's ears where she sat making row upon row of beautiful buttonholes—her stint in the day's work of the Ladies' Aid society.

"It seems as if some of us ought to go down there 'fore she goes, and give her a piece of our mind!"

The speaker was Mrs. Ezra Shoemaker in the full tide of righteous indignation. Mrs Wiersema hitched her chair round until she could touch Mrs. Bailey on the shoulder with her thimble.

"Who they talking about, Mary? Who's going, and where they going to?"

"Why, that Lakin girl that lives kitty-corner from you. She's going to leave her father and them two little half brothers and go back to clerk in the store at King's Mills where she was before they come here," explained her friend.

"All 'tis, she hates to do housework," Mrs. Shoemaker went on. "She don't like to scrub floors and such, and she's going to keep her hands out the wash water if she has to leave that poor helpless family to starve to death. I say it's a burnin' shame and ought to not be passed over without her knowing how respectable people feel about it."

"Some folks hates housework worse than others," little Mrs. Thoms admitted. "Now I love it, scrubbin' and all, but I've got a cousin—"

"She'd ought to do her duty by her fam'ly regardless," put in Julia Butler. "Nobody could hate to scrub worse than I do—seems to me I never get done—when 'tain't the kitchen floor it's the baseboard in the dining room or the pantry ceiling—but I'll say this for myself, I do my duty by that house if I am skin and bone in consequence."

"Yes, you do, Julia," half a dozen assured her.

"Course Rhoda Lakin ain't but 17," Mrs. Thoms added after a moment of silence.

Mrs. Shoemaker turned on her a reproving face. "Candace Thoms," she inquired in a loud, scandalized voice, "do you mean to say you think 17's too young to know right from wrong and do it? Why, every lady of us here was a member of the church before we was 16—"

"What I want to know is, who'd she tell?" Mrs. Wiersema put in unexpectedly. "Sounds to me like hearsay. To my knowledge there ain't a soul ever goes there, and she ain't a girl, from her face, to talk much to folks she don't know. I think she's lonesome, that's what I think."

"She's likely to be lonesome the best part of her life if she leaves her plain duty," Mrs. Shoemaker said severely.

"It seems she was next to Elvira Shoemaker in the bank this morning," Mrs. Bailey explained in an undertone to Mrs. Wiersema. "Elvira noticed she'd drawn out all she had in,—$12,—and said, 'You must be goin' into the city to shop with all that.' You know how young folks will speak, even when they don't know each other. And this Rhoda, it seems she threw back her head and says, 'Yes, I am; I'm going away from this town tonight, back to King's Mills. And I wouldn't come back here to live if I was to be drawn by wild horses!' Course Elvira flew home and told her mother, and she thinks the girl ought to be spoken to by a committee."

Mrs. Wiersema's face settled into lines of grim amusement.

"I'm not one to want to serve on that committee," she asserted.

A stir among the ladies round the dining-room door announced the coming of refreshments. Ravelings were brushed to the floor and laps smoothed, preparatory to the passing of napkins and plates. Mrs. Wiersema was thoughtful while she stirred her coffee; she gave but slight attention to the sandwiches and scarcely noticed when she began on Mrs. Postle's velvety angel cake. Mrs. Bailey undertook to rally her and received only a blank eye in return. Finally Mrs. Wiersema glanced down at her plate. "Goodness me, have I eaten my cake?" I've a mind to ask for another piece."

Ten minutes later she made a glass of water an excuse to follow her hostess into the kitchen.

"I know it ain't manners to eat and run, Mrs. Postle," she explained behind the door, "but I've just recollected something I got to tend to, so I'll have to leave early. I'm taking a bundle of work along, and I'll turn it in tomorrow. Can't I go upstairs the back way to get my things? If one goes early, it always sets the rest of 'em off, and it appears to me there's lots of work yet to be done."

"Take buttonholes!" Mrs. Postle urged.

Mrs. Wiersema looked through the trees to the town clock before she turned in at her own back gate. It was barely half past three. In the house she stayed only long enough to search out a seed catalogue that had come the day before. After that she locked the door behind her, stiffened her shoulders and made straight for the Lakin house across the street and up to its screened front door.

Her knock resounded through the house. In the silence that followed she could hear the drip-drip of water from a loose kitchen faucet; but there was no answer. The two little boys were still at school, and if their sister was at home she made no move. But Mrs. Wiersema kept on knocking, and after a while there was the quick sound of an impatient step, and Rhoda Lakin came out of the front bedroom and stood looking through the screen at Mrs. Wiersema out of dark, hostile eyes. The room behind her was spick and span, but in the bedroom beyond dresses hung over a chair, and a suitcase lay in plain sight, spread out on the bed. This Mrs. Wiersema took in with a quick glance before she said:

"I know you're Rhoda Lakin, but I don't suppose you have the ghost of an idea who I am."

The girl only looked coldly at her visitor and said, "No, I don't know you."

"The more shame to me then," said Mrs. Wiersema briskly. "I'm your neighbor across the street in the house with the blinds. Your little brothers play with my Jimmy—Jimmy Wiersema."

The girl continued to look at her with tightened lips.

Mrs. Wiersema's eyes twinkled. "There's one thing I'm not," she declared whimsically. "That's a book agent."

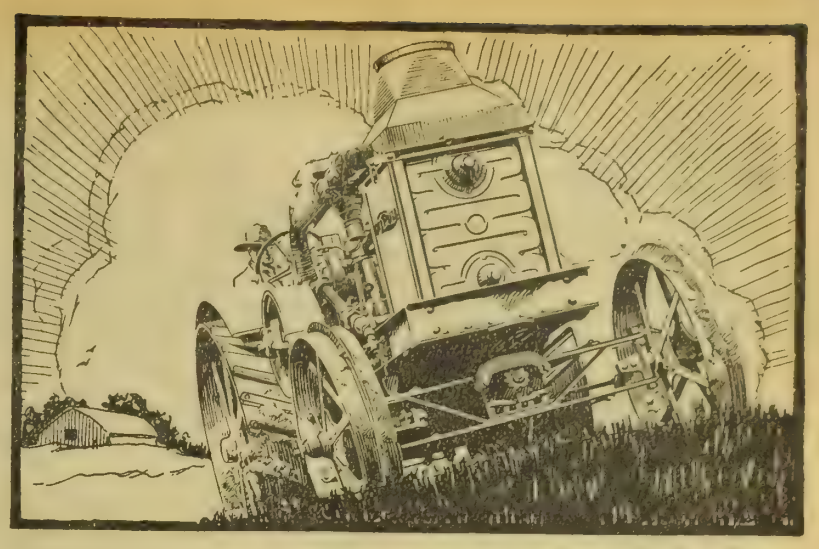
A glimmer passed over the girl's face. "I beg your pardon!" she said dryly. "Of course—come in. I'm rather busy just now, but if there's anything —" She led the way into the front parlor and with an ungracious hand indicated a chair.

"I'm not one to beat about the bush," Mrs. Wiersema began briskly; "so I'll say right out I've come to ask you something and to tell you something. And the first is, Did you ever raise flowers?"

"Not any to speak of," the girl replied coldly. She cast a disinterested eye on the seed catalogue in Mrs. Wiersema's hand. "There's some people flowers won't grow for," she added. Her face fell into bitter lines.

(Continued next week)

"The kiss of the sun for pardon,
The song of the birds for mirth;
One is nearer God's heart in a garden
Than anywhere else on earth."



How long should a tractor last?

Is 5 years the average tractor life? Or should yours last 10, 15, even 20 years?

Choose a Rumely OilPull and you'll get one of America's longest lasting tractors. This is proved by hundreds of OilPull records like the following:

"Old Number One," the first Rumely OilPull built, is 12 years old and still in service. It has turned 1750 acres of wild sod, 5600 acres of stubble and has supplied power for 302 days' threshing—over 750,000 bushels. All with a repair expense averaging only $16.66 a year.

OilPulls No. 8, No. 9, No. 11 and hundreds of others have built up similar records. For long life, low upkeep cost and day in and day out dependable service, probably no records in tractor history equal them.

These remarkable tractor records are due to the famous Rumely OilPull design. For over 12 years this original design has stood the test of severest field conditions. In that time it has not been fundamentally changed.

True, refinements have been made, parts have been strengthened and performance has improved. But there still remain such tested features as Triple Heat Control, which permits burning 15c kerosene; stove tops, etc.; oil cooling; heavy duty motor; spur transmission; straight membered frame, etc.

Your Rumely OilPull dealer is an expert in rendering tractor service. He will gladly demonstrate these unusual OilPull features. See him, or write for new book describing the four OilPull sizes. It is free.

The Iron Food for Vitality

How to Feed Men on a Farm

—*what a cook found out*

A COOK had a problem in left-over bread (as you have, no doubt). This is how he solved it.

He made *raisin*-bread pudding — not plain *bread* pudding, for his men had frowned on that. The raisins made the dish *new* with new appetite appeal. The men ate all and asked for more. Next day they asked for it again. Soon he had to make it *twice a week*. He had to bake bread *extra* for that pudding!

All the men did *better work*. It became less trouble to get help. The outfit was soon *famous* for its food. Men *wanted* to work there. There was *more* efficiency, *greater* output, *less* expense.

All started by a simple recipe for *raisin*-bread pudding!

Sun-Maid Bread Pudding

To a pint of bread crumbs add a well-beaten egg, a cupful of milk, one-third cupful of molasses and 1 cupful of Sun-Maid Seeded Raisins cut in halves. Mix well together, then stir in ½ teaspoon each of cinnamon, salt and soda. Turn into a buttered pudding boiler and cook two hours. Serve with the following sauce: Beat to a cream ½ cupful of butter and gradually beat into it a cupful of sugar. Add any preferred flavoring. When it is smooth and creamy pile it roughly on a pretty dish, place it where it will get cold, and before serving grate over it a little nutmeg.

Raisins are cheaper by 30% than formerly—see that you get plenty in your food.

Try It With Your Men

Try with *your* men. Note the recipe for the pudding printed here. See how quickly you use up left-over bread. Serve it twice a week *beginning now*. See how many ask for second helpings. Learn what this delicious dish can save you in time, trouble and cost.

Raisins add *nutrition* as well as luscious *flavor*—1560 calories of energizing nutriment per pound. So they're food for men who *work* hard—food that *satisfies*.

SUN-MAID RAISINS

Sun-Maid Raisins are the finest grown—made from choicest tender, juicy California table grapes. Seeded (*seeds removed*); Seedless (*grown without seeds*); Clusters (*on the stem*). Be sure to get the Sun-Maid Brand.

HOME ECONOMICS FOR A COMMUNITY

By Jean A. Koethen

THE sight of a hundred or more women gathering month after month just to learn more economical ways of running their homes and dressing themselves and their children is one so rare that it is outside the experience of most of us. "The best of it is," declared Mrs. E. E. Dotson, secretary of the home department of the Escondido farm bureau, who told me the story, "that it is all done without tea and wafers. There are no eats in it at all. If it is necessary for us to have an all day meeting we bring our own sandwiches and cookies and put them all together. There are no cliques, no exclusive circles of lunchers. We are all sisters, though not all farmers' wives, and each is for all and all for each. If some woman who is down and out comes with her children to learn to make them dresses and waists out of flour sacks and hats for a few cents apiece we all take hold and don't let go till they are outfitted. The woman who has all the clothes she needs is glad and happy to give her day a month or more to help in the general work, whether it be dressforms or hats."

Sounds Utopian, doesn't it? But it is just what has been happening in Escondido for three years. I heard of it as soon as I got into town, where I had gone to look up poultry matters, and I kept on hearing of it. They are mighty proud of their home department there at Escondido, and no wonder, for it bears the distinction of being the biggest organization of its kind in the United States.

The French have a motto, "Look for the woman" (Cherchez la femme), which they use when anything out of the ordinary happens. As might be expected, there is a woman behind this remarkable home department. "It is simply tragedy," declared Mrs. Dotson, "that Mrs. Matzen is out of town today. She has been president for three years, and it is her vision, her push and energy that are in the main responsible for what has been done. She is tireless in her efforts to bring every woman into the organization and to bring to its monthly meetings the best instruction that can be obtained. A busy woman, running a farm and helping often in her dentist husband's office, she still finds time to give the best of herself to the women of her community."

After meeting Mrs. Dotson I feel sure Mrs. Matzen is not the only enthusiast on community home economics. The willingness with which officers and leaders in the department give their time for being instructed and then passing on the instruction they have reecived to others shows that there are many earnest spirits among them. "We never dare stay away from a meeting," the secretary assured me, "because we know we will miss something good if we do." This is the secret, in part, at least, of the remarkable attendance Mrs. Matzen, Mrs. Dotson and their helpers have been able to secure.

Last year the department had 130 members. This year, because it has been more difficult to secure instruction from outside, little effort has been made to bring in new members, but the attendance at the millinery meeting in March was 65 the first day, 81 the second day and 78 the third. And to have 100 women present at the regular monthly meeting at the Woman's Club house is by no means uncommon.

Hats and Dress Forms

At the October meeting last year 100 hats were made, and at the March meeting this year a still larger number. A specialist from the home economics department of the University of California, Mrs. Powell, was at these meetings with buckram frames which she sold to the women at cost. The women were urged to bring old pieces of silk, ribbons, any old scrap that could be worked into a hat, and the result was a marvelous collection of inexpensive and beautiful hats. Mrs. Dotson said she made an elegant one out of an old silk skirt, and she showed me one her little daughter made out of braid. The average cost of these hats was not over $2.50, and 104 of them were made at the March meeting. Think what a saving to the community!

Dress Form Meeting of Escondido Farm Bureau Home Department

Even more interesting from the Cultivator standpoint was the dressform meeting last May. Following directions published in the Cultivator of May 28, 1921, 130 dress forms were made of paper and shellac, and 130 women rejoice in dress forms that would cost $15 if bought at retail, for the trifling expenditure of about $1.50. Strips of gummed paper are pasted over a knit undervest on the body of the woman who is to use it, covered with shellac and then allowed to dry before it is cut off. When this is mounted on a wooden pedestal which brings it to just the right height it makes a dress form equal to any.

Miss Theda Smith, San Diego County farm bureau demonstrator, has been the greatest possible help to the Escondido women. She is present at nearly every meeting, bringing either a specialist or some new idea which she demonstrates, first to a chosen committee, and then with them to the others. At the June meeting the subject was interior decoration, and Miss Smith brought a specialist who lectured on draperies and furnishings. At another meeting instruction was given in making men's ties out of ribbon, a yard and a half of ribbon making a $1.50 tie.

How to make a nice dress out of an old coat suit, to make pretty wash dresses out of dyed sugar sacks, to draft patterns and change old patterns to suit modern styles; to take dresses by measurement; to clean and press their own and their husbands' suits—these are just a few of the useful things these women learn at their meetings. And not only is instruction brought by outside specialists. Every woman who comes into the valley with any special gift or knowledge is straightway brought to the meeting and required to impart it to the department. And every woman who picks up anything new in the course of her reading or travels is expected to pass it on. This home department is a real clearing house for useful household information, and the best of it is that the women who need the help most are those who get most of it. "Uplifting" themselves and everyone they can reach is an art these San Diego County women are learning through their home department.

The Cultivator Patterns

3699-3698. Ladies' Costume.—Waist 3699 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3698 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress for a medium size will require 8¾ yards of 32 inch material. The width of the skirt at the foot is 2½ yards. TWO separate patterns 10 cents FOR EACH pattern.

3688. Girls' Dress.—Cut in four sizes: 6, 8, 10, and 12 years. A 10 year size will require 3¼ yards of 38 inch material. Price 10 cents.

3706. Ladies' Apron.—Cut in four sizes: Small, medium, large and extra large. A medium size will require 2⅝ yards of 36 inch material. Price 10 cents.

3711. Boy's Suit.—Cut in four sizes: 3, 4, 5 and 6 years. A 6 year size requires 3⅜ yards of 27 inch material. If made as illustrated trousers and collar will require 1⅞ yard of material and blouse 1½ yard. Price 10 cents.

3471. A Pretty Dress.—Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The width of the skirt at lower edge is 2 yards. A 38 inch size will require 4⅝ yards of 44 inch material. Price 10 cents.

3703. Junior's Dress.—Cut in three sizes: 12, 14 and 16 years. A 14 year size requires 3¼ yards of 40 inch material. Price 10 cents.

3517. Work or Morning Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. For a medium size six yards of 36 inch material will be required. The width at the foot is 2¼ yards. Price 10 cents.

3506. Girl's Dress.—Cut in four sizes: 6, 8, 10, and 12 years. An 8 year size will require 1⅝ yard of 36 inch material for the guimpe, and 2½ yards for the dress. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

RANCH DESSERTS—WITH CREAM

By Mrs. G. W. Squire

I am sending four recipes for ranch desserts which I claim to be more or less original. I have never seen exact duplicates, and I warrant them to please the farmer—and his cook, if she has plenty of cream.

The many good recipes have increased the interest of the Household Page; we shall soon have a complete Cultivator Cook Book. I like to see the stories. My four year old always asks if there is a "little" story this time.

Farmer's Dumplings

Put through the food chopper one cup walnuts. Into simmering, sweetened stewed apples put these drop dumplings: Two cups flour sifted with half teaspoon salt, four tablespoons sugar and a sprinkling of cinnamon; moisten with one teaspoon melted shortening in two-thirds cup of water. Drop by tablespoons. Boil gently 20 minutes without removing lid. Serve with fruit around the dumpling, thick cream drowning it, and ground walnuts on top.

Rosy Love Pudding

Into three cups of boiling Satsuma plum juice stir three tablespoons of instantaneous tapioca and half cup of sugar. Cook smooth and serve hot or cold in thick or whipped cream.

Honey-Boy Peach Rolls

Make paste of one-half cup cooking oil, two cups flour, pinch soda, one level teaspoon salt and about one-half cup water. Roll into rounds the size of a saucer. Put stoned peach with sugar in each round and roll up into a boat shape. Rub over with sweet cream to give gloss and flakiness. When baked, serve hot with cream around it and a little honey or syrup in the boat-like hollow.

Sundae Cream Puffs

Two cups chopped apples, one cup ground walnuts, one pint whipped cream. Puffs: Put two cups water with one-half cup butter in kettle and bring to a boil. Stir in one cup flour, dry, stirring fast till smooth. When cool enough not to cook egg, beat in gradually three unbeaten eggs. Put one teaspoon of the batter in each gem pan and bake. Slit puffs and fill with nuts and apples folded into the whipped cream. Sprinkle with powdered sugar. Apples or nuts can be omitted if you flavor the cream with vanilla. These puffs never fail if oven is hot.

HINTS FROM HOUSEKEEPERS

Preserved Figs

Wash and weigh figs. To each pound add ½ pound of sugar and enough water to make the figs float and vinegar to make it a little tart. Five pounds figs 2½ pounds sugar, 1½ quarts water, 1 cup vinegar, 1 tablespoon whole cloves, 1 stick cinnamon. Cook one hour and let stand until next day. Turn figs well and cook one hour the second day. Third day cook until the syrup is thick. They can stand until cold and if syrup is not thick enough, cook again. Take out cinnamon and put in fresh pieces top and bottom of jar.

These I have used as Christmas gifts to friends in the East, wrapping jars in corrugated paper, then putting in breakfast food boxes. They went through the mails without breakage and seem to have been heartily appreciated.—E. L. B., Los Angeles.

The worst incompetent in any business is the person who is so cocksure he knows everything that he doesn't take the time to learn anything. This applies to employer as well as employee.

"The meek shall inherit the earth—but they must not grow impatient about it."

Formaldehyde, one to nine of water, is excellent fly poison. An inverted glass on a blotter makes an effective self-feeder to kill the pests.

A little flour dusted over top of the cake before it is iced will prevent the icing running off.

If you think you are bright, keep it dark.—Boston Transcript.

RONDEAU OF A HOT STOVE

"When winter comes," says Ma, "I go
To where the summer's overflow
Of all the things our garden grew;
Our berry patch; our orchard, too;
Stand waiting in a shining row

"Atop my pantry shelves. You know,
They're pretty, even as they grow,
But prettier, I'm telling you,
When winter comes!

"But stoves are hot in summer, so
There's many hunts the portico,
And fans themselves, and takes the view;
(I understand their feelings, too!)
The same hot stove's a blessing, though,
When winter comes!"
—Ohio Agricultural College.

THE HOUSEHOLD BUDGET

Much of the financial difficulty in a great many American homes, the advocates of the household budget assert, is due to the lack of some system suitably apportioning the family income to cover the cost of food, shelter, savings, clothing, and the other things which must be provided for decent and comfortable living, not forgetting provision for education and wholesome recreation. The problem cannot be solved by merely living within the family income.

PROVIDED HOUSEHOLD SUPPLY

The problem of having running water in the house, as well as on the farm, is one which farmers everywhere are struggling to meet. The county agent of Cabarrus County, North Carolina, employed by the United States department of agriculture and the state agricultural college, was able to persuade one of his demonstrators to dig out a basin on the side of a hill near his house and line it with cement instead of building a tower. The elevation was about 20 feet above the top of his house, which gave sufficient pressure. The outlay for placing water in both his and his brother's house was $400. The basin holds about 2,000 gallons and keeps the water at a more uniform temperature than would a tank in a tower, which would have cost twice as much.

WEARING ON BANKROLL

"Are you saving for the proverbial rainy day?"

"No. It's all I can do to keep up with the present dry spell.'—New York Sun.

Advice to parents: Pass the buck to the schools and then wonder why your children laugh at your advice and follow your example.— Kansas Industrialist.

The lime requirement of growing children is relatively very high on account of the growth of bone and other tissues which is taking place. A pint of milk a day in the diet of every person insures safety against a possible deficiency of lime, which might result in lowered vitality and disease.

When the City of Happiness is placed on the map, it will be found in the State of Mind.—Southern Pacific Bulletin.

"Feed me," cries the Bolshevik Russion, "that I may renew my strength to tell the world the blessings of communism."

As mortals go, how few possess,
Of courage, trust and faithfulness,
Enough from which to undertake,
Without some borrowed traits to make,
A decent dog.—Joe Anderson.

It is not always easy to keep out of the rut, but the fellow who does gets a lot of joy out of life.—The Retail Baker.

Wisdom is knowing what to do next. Skill is knowing how to do it, and Virtue is doing it. — David Starr Jordan.

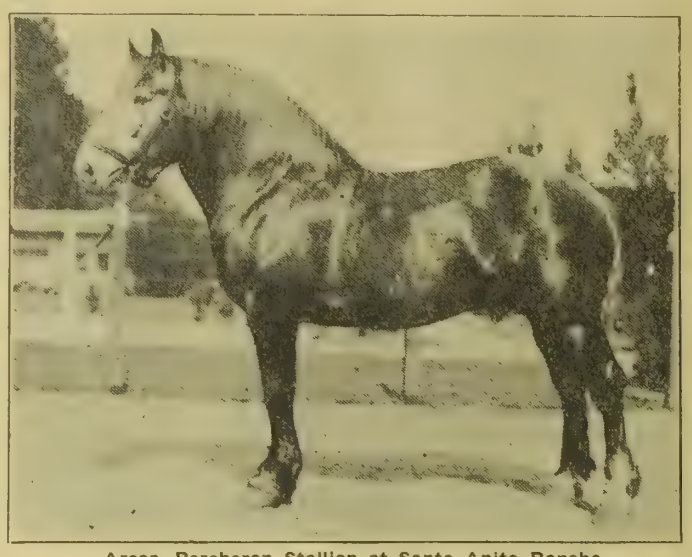
California Breeding Farms

By Jack Klein

SANTA ANITA RANCHO

FOUNDED in 1873 by the late Elias J. (Lucky) Baldwin, the Santa Anita Rancho has always stood for the best in everything pertaining to livestock. The original ranch contained 8,500 acres, but these were augmented by other purchases until at one time 54,000 acres of the most fertile land on the Pacific coast were included in the domain. It was imperative that this great tract, which included the entire San Gabriel Valley be subdivided and colonized by thousands instead of remaining in the hands of one family, so from time to time portions were sold, and the Santa Anita Rancho of today contains about 3,500 acres of the most fertile land which surrounds the old Baldwin home.



Arsar, Percheron Stallion at Santa Anita Rancho

From its earliest day the ranch brought honor to its owner and to California through the Thoroughbred horses which were bred and trained there. In 1885 the great colt, Volante, won the American Derby at Chicago, the greatest three-year-old race in America. Three times after that the black shirt with the red Maltese cross of the Santa Anita Rancho flashed under the wire in this race ahead of all other entries. No other breeder nor owner was ever able to capture this event more than once.

The present owner is Mrs. Anita M. Baldwin, the younger daughter of the founder. Mrs. Baldwin inherited all of her father's love for livestock and under her direction the Santa Anita Rancho has progressed very rapidly in other lines as well as in the horses. Given a perfect site, with countless great live oaks, fertile land and an abundance of water, she has created a ranch which is at once the joy and envy of all who visit it.

The Thoroughbreds are still a very considerable portion of the ranch's activities and the descendants of the great sire, Emperor of Norfolk, who won the American Derby in 1888, are in constant demand by the men who follow "the sport of kings." At the head of the stud is the well known stallion, Adalid, who is assisted by the youngster, Lantados. The mares are beautiful creatures and include Reina De Santa Anita who was junior champion Thoroughbred mare at the P. P. I. E. and a most wonderful filly named Cruzada.

Along with the runners we find an excellent stud of Arabians headed by Ibn Mahruss who was presented to the cartoonist Homer Davenport by the Shah of Persia. This horse is said to be one of the greatest Arabian stallions in the world. The mares are of the highest type and are capable of sustaining the reputation of their consort.

Another part of the ranch is set aside for the use of the Percheron stud, and here are many of the great individuals of the breed. The young stallion, Arsar, who was grand champion at Los Angeles and Riverside last year, heads this department. Sired by Imp. Jusque, the great prize wining iron gray who so long headed the stud, he is out of Oaklawn Queen who has been pronounced the greatest American bred Percheron mare. Arsar has proven himself to be a horse of the highest type, and his colts follow him very closely in type and conformation. The mares have been great prize winners wherever shown and the youngsters have all done their bit to keep the name of the rancho in the front ranks. The care given the young stallions when they are growing and being schooled is a very valuable asset as they are always gentle, and perfect strangers are as safe in the stalls with them as they would be with an ordinary gelding. It is the owner's wish that they be treated as gentlemen, and a whip is a thing unknown to any of them, so that even in the breeding yard they can be relied upon to behave themselves. Young stallions which have gone out from this ranch have always proven to be all that is desired in every way.

In the draft division there is a large stud of Mammoth jacks and jennets. When the stud was established the foundation stock was all brought from the prominent farms of the Blue Grass state, and King Bersheba, who won sweepstakes for jacks of all ages at the Lexington, Kentucky, Blue Grass State Fair in 1914 was placed at its head. He is one of the largest jacks in service, standing 15⅝ hands high with a girth of 66 inches, and has a 9 inch bone. As an individual he is a wonder and his get follow him very closely. He is of the type that shows great strength and early maturity, and a mule colt sired by him, shown last fall, was the joy of all who saw him. At one year of age this colt weighed nearly 1,700 pounds and was as big as the ordinary mule when full grown.

One of the best known activities of the ranch is the herd of Holstein cattle. Numerous purchases of the best animals to be found have provided an excellent foundation. The best known individual of the herd is the bull, King Korndyke Pontiac Acme, who was purchased from A. W. Morris and Sons at the National Sale in St. Paul for $41,000. This bull combines the greatest families that have ever been developed in the state. His sire, King Korndyke Pontiac 20th, was dropped on this ranch and sold as a calf for $6,500 to W. J. Higdon of Tulare. He was sold in Mr. Higdon's sale last

A fine young bull out of an advanced registry dam for your next herd sire. Write us about him.
Elkhorn Ayrshire Farm Watsonville, Cal.

year to Burr Farm of Los Angeles for $12,000. The sire's dam, Miss Valley Mead De Kol Walker, is one of the greatest cows of the state and has twice made over 1,000 pounds of butter in ten months, as well as making 36.81 pounds of butter in seven days. She holds the world's eight-months-after-calving record for the class, 25.15 pounds of butter when three years old. She is a daughter of Prince Gelsche Walker.

The dam of King Korndyke Pontiac Acme is the remarkable heifer, Miss Aaggie Acme Burke, who made 1,034.44 pounds of butter from 24,338.8 pounds of milk as a two year old. Her milk record was a world's record for a time. It was beaten by a cow in Washington who has since died. On test at four years of age she made 35.38 pounds of butter in seven days and has made 825.68 pounds from 18,393.1 pounds of milk in seven months.

This bull has a very enviable record behind him. His six nearest dams average 1,113.58 pounds of butter for the year and five of them have made world's records. His seven nearest dams average 1,058.16 pounds of butter in 365 days and some of the records were made by young cows. He has quite a show record and his calves are of the type that please the breeders. He is being given heavy service to some very wonderful cows and promises to make a name for himself. The rancho gives every cow an official test and usually runs her for the year. Conditions for testing are ideal, with wonderful equipment, and some very fine records have been made there. At present the herd numbers nearly a hundred head, with some very excellent heifers due to freshen soon from service to the great young herd bull.

The rancho also maintains a fine herd of Poland China hogs in which are many prize winners. The two young boars, Santa Anita Orange 2nd and 3rd, by Orange Boy and out of Santa Anita Orange Bud, who was grand champion at Los Angeles and Riverside, are being used as herd headers. These junior yearlings were winners in the shows last fall and are proving themselves great sires. Santa Anita Rancho has always been a winner in the Poland China classes and the present herd is far above any they have had previously. Every animal is big type from the beginning and is just what the public demands in both pork and breeding hogs.

Mrs. Baldwin has been very fortunate in securing the services of Chas. MacDonald, formerly of Toyon Farm, as manager of her great estate. Mr. MacDonald is a thorough livestock man as well as farmer and is well fitted for the varying duties he is called upon to perform. Under his direction the Santa Anita Rancho cannot help but come to the front even faster than before and be able to hold its place as one of the really great breeding establishments of the entire country.

ARIZONA RANGES WELCOME RAINS

The U. S. weather bureau station at Phoenix, Arizona, reports:

"Too much water on the range is a statement difficult to believe in the light of many months' drouth, yet that is the report from the observer on the northeastern plateau with headquarters at Pinto. That section continues to report heavy showers and there is an unusual amount of water standing in tanks and water holes. At Pinedale immediately north of the Mogollon rim heavy rains have continued and range and water are 200 per cent compared with normal and cattle are excellent. Moderate to heavy showers continue on the drainage basin of the Roosevelt reservoir and the run-off is considerable; range conditions and stock are excellent. Rainfall was lightest in the southeastern section of the district but range and stock are reported good. Owing to the local character of showers at Williams the town reservoir is dry while range in that vicinity is good and the water supply plentiful. Moderate rainfall occurred in the vicinity of Grand Canyon and over the Prescott national forest and the range and stock are in good condition. Wild grass has been cut for hay to a considerable extent during the week for which purpose the weather has been fairly good.

"While the atmosphere has been fairly moist during the week it was somewhat drier than the week preceding and cotton made fair progress. Oranges are doing well and sizing up nicely in both the Salt River and Yuma Valleys. Potatoes continue in good condition in the northern counties and a good crop is in prospect. Dates from local trees are in market and are of attractive appearance."

BULLETIN ON MILK GOAT

A bulletin, "The Milk Goat in California" has just been issued by the experiment station of the state college of agriculture. It is written by E. C. Voorhies of the animal husbandry department and gives general information regarding milk goats and the products obtained from goat milk. It also records results of experiment work in this field by the station from 1914 to 1916.

This bulletin may be secured free by any Californian on request to Agricultural Experiment Station, College of Agriculture, Berkeley.

CATTLE SLAUGHTERED IN CALIFORNIA

Figures compiled and sent out by office of cattle protection, state department of agriculture. These figures cover the first six months of 1921:

Cows, 127,584; calves, 96,403; steers, 142,906; bulls and stags, 4,437; total slaughtered, 371,330.

Number of cattle shipped from counties in state for slaughter at larger slaughtering centers in California, January 1, 1921, to June 30, 1921: Cows, 49,488; calves, 50,833; steers, 85,599; bulls and stags, 1,696; total, 187,616.

Number cattle shipped from California to adjoining states for slaughter January 1, 1921, to June 30, 1921: Cows, 1,414; calves, 495; steers, 2,615; bulls and stags, 66; total, 4,590.

Number of cattle shipped into California for immediate slaughter from adjoining states and Canada January 1, 1921, to June 30, 1921: Utah, 627 cows, 1,459 steers, 1 calf, 176 bulls and stags, total 2,263; Oregon, 280 cows, 2,077 steers, 12 calves, 1 bull or stag, total 2,370; Idaho, 82 cows, 904 steers, 140 bulls and stags, total 1,126; Texas, 100 cows, 865 steers, total 965; Arizona, 62 cows, 298 steers, 1 calf, total 361; Nebraska, 157 steers; Nevada, 1,299 cows, 1,547 steers, 92 calves, 110 bulls and stags, total 3,048; New Mexico, 11 cows; Canada, 49 cows. Total, 2,510 cows, 7,307 steers, 106 calves, 427 bulls and stags. Grand total 10,350.

Number cattle slaughtered in state under meat inspection ordinances and regulations January 1, 1921, to June 30, 1921, 241,598. Number cattle slaughtered without meat inspection, 127,827.

LIVESTOCK AT SAN FERNANDO FAIR

Hamilton (Horse) Bassett, who is managing the $1,000 a Night Horse Show to be held in connection with the Los Angeles County Fair at San Fernando September 19 to 24, has just returned from a trip through Northern California where he has visited owners of famous horses in that section. His first act upon arriving home was to order two more rows of box stalls built, in addition to the 116 box stalls and 50 plain stalls that were already ordered. When finished, the huge arena will be flooded with a beautiful soft white light and will be decorated in the liveliest fashion to furnish a proper background to the 200 or more wonderful horses that will be seen at this show.

The horse show and the livestock show will be the two premier events of the big county fair, although the power farming machinery department and the tractor demonstration, the national poultry show for California for 1921 and the agricultural and industrial departments are all organized on a tremendous basis that will be a credit to the county.

M. H. Adamson and E. J. Sturgis, chairman and vice chairman of the livestock show, are in San Diego at the present time and they send word that Dr. A. B. Wessells and Walter Dupee will both be here to show a herd of animals. There will also be two carloads of Ayrshires from A. MacMinn, Phoenix, Arizona.

SONOMA COUNTY FAIR

Sonoma County has a just pride in the results of the fair ending last week. It is already shouting: "Bigger and better next year. It will be a real fair."

One of the leading exhibits at the fair was the "Egg to Egg" exhibit. Practically the whole of the poultry industry was shown in this feature, and the whole of the poultry industry, from Sonoma County's standpoint, is some story. Besides poultry, livestock, especially dairy cattle and Berkshire hogs, made a showing which was really a wonder. The Guernseys and Jerseys were strong. In livestock there were exhibits from Thorp, Humphrey, London, O'Connor, and others, but these names are given in the list of awards.

The association now owns about 160 acres. It is erecting permanent buildings to the value of nearly $150,000.

Appointment of Milo D. Campbell of Coldwater, Michigan, president of the National Milk Producers Federation, to fill a vacancy on the federal trade commission on expiration in September of Commissioner Pollard's term, is being urged by many strong national farm organizations.

A score or more of the state's most famous pedigreed horses will be seen out in the trotting and pacing events at the Fresno district fair, September 26 to October 1. There will be keen rivalry between some of last year's eastern and other winners and seconds at Fresno.

Report of State Dairy Cow Competition, July, 1921

By Prof. F. W. Woll

List of cows producing 50 pounds of butter fat or over during the month:

Adohr Stock Farms, Guernseys and grades: C-115, 1,535 lbs. milk, 66.01 lbs. fat; C-310, 1,314, 55.19; C-319, 1,066, 53.30; C-269, 1,231, 51.70; Daisy of Sunny View, 1,023, 51.15.

Arden Dairy, grade Holsteins: 982, 1,500 lbs. milk, 66.00 lbs. fat; 58, 1,429, 51.44; 188, 1,175, 50.53.

Anita M. Baldwin, Holsteins: Lady Lilith Walker DeKol, 2,193 lbs. milk, 79.81 lbs. fat; Thelma Riverside Walker, 1,943, 60.63; Ellen Walker Hartog, 1,678, 57.73.

Dean Beeman, Holsteins: Jacobina, 2,166 lbs. milk, 63.69 lbs. fat; Capunista, 1,918, 59.45; Bernice NaDean DeKol, 1,709, 58.62.

Berylwood Stock Farm, Holsteins: Fay Tritomia H. W., 1,949 lbs. milk, 65.08 lbs. fat; Douwe Pontiac, 1,530, 56.93; Romeana Douwe, 1,733, 56.14; Holland Pietertje H. II, 2,107, 55.62.

E. Biondini, grade Jerseys: Rachel, 1,469 lbs. milk, 71.98 lbs. fat; Midget, 1,469, 70.51; Twinnie, 1,246, 64.79; Brownie, 1,234, 64.17; Shortie's Best, 1.060, 63.60; Hannah, 1,048, 59.74; 1910, 1,389, 59.73; 62, 952, 57.12; Judy, 1,197, 53.87; Rosalie, 809, 50.97; Dottie, 1,097, 50.46.

N. L. Browning, Holsteins: Segis DeKol Bess, 1,805 lbs. milk, 56.85 lbs. fat.

Leo Christen, grades: Mama Jersey, 1,333 lbs. milk, 65.32 lbs. fat; Newberg, 1,683, 58.91; Buttercup, 967, 56.09; Black Beauty, 1,358, 54.32; Mousie, 1,082, 54.10; Blue, 1,460, 52.56; Lily, 1,169, 51.44; Young Lumpjaw, 1,646, 51.05.

M. P. Christensen, Holsteins: Marken Louise, 1,491 lbs. milk, 58.15 lbs. fat.

D. F. Conant, Jerseys: Lady Kate's R. of R. S. M., 1,020 lbs. milk, 50.57 lbs. fat.

J. W. Coppini, Jerseys and grades: Noble's Sayda Polo, 878 lbs. milk, 64.08 lbs. fat; Olga Fern's Olga, 1,026, 59.49; Lady Mc., 1,370, 57.81; Hazel Marigold of F., 961, 51.20.

W. F. Early, grades: Little Darling, 1,156 lbs. milk, 64.74 lbs. fat; Rosy, 1,299, 63.65; Pencil, 1,321, 59.45; Roany, 1,500, 58.50; Butterfly, 1,256, 57.78; Creamcup, 995, 55.72; Black Ward, 1,026, 55.40; Darky, 1,339, 54.90, Lineback, 1,061, 54.21; Granny, 1,290, 54.18; Humboldt Maid, 973, 53.52; Novene, 1,032, 50.57; Jack Rabbit, 884, 50.39.

El Mirador Dairy, grade Holsteins: Belle, 1,504 lbs. milk, 60.16 lbs. fat; 53, 1,259, 50.36.

J. A. Genzoli, grades: Dollie, 1,627 lbs. milk, 86.23 lbs. fat; Sarah, 1,423, 78.27; Jill, 1,103, 67.28; Blue Spot, 1,481, 66.65; Brownie, 1,047, 60.73; Pansy, 1,091, 58.91; Princess, 939, 57.28; Fannie, 1,119, 55.95; Baby, 1,202, 54.09.

Earl Graham, Holsteins and grades: Princess Maida V., 2,355 lbs. milk, 75.61 lbs. fat; Gamma Sarcastic of L., 1,964, 67.17; Hauser, 1,758, 66.80; Pansy, 1,575, 64.58; Pinkie, 1,531, 62.77; Montana, 1,447, 57.88; Cora Jarie P., 1,385, 57.75; May Walker G. K., 1,576, 55.01, Niger, 1,448, 53.58; Peg, 1,100, 52.80; Black Emma, 1,448, 52.13; Tomie, 1,358, 51.60; Miss Segis P. W., 1,287, 50.82.

W. B. Gries, grade Jerseys: Nig, 964 lbs. milk, 55.91 lbs. fat; Brindle, 1,125, 54.00; Bessie, 778, 52.13.

H. G. Gross, Jerseys: Lydia's Valentine, 957 lbs. milk, 55.98 lbs. fat; Cynthia of B. V., 1,086, 52.13.

J. B. Harbers, grade Jerseys: Bertha, 1,032 lbs. milk, 54.70 lbs. fat; Polly, 939, 54.46; Clara, 828, 52.16.

Fred Hartsook, Holsteins: Bessie Snowball DeKol, 2,297 lbs. milk, 77.42 lbs. fat; Parthenia Paul S., 2,266, 75.44; Miss Aaggie DeKol M., 2,095, 75.21; Segis Tubie Col., 2,134, 74.25; Parthenia Champion, 1,945, 73.52; Junette Heng. Cloth., 2,413, 71.67; Athenia Rod. Luecke, 2,541, 69.63; May Altoona P., 2,052, 68.14; Fascination DeKol II, 2,106, 67.82; Beryl Mortum L. DeKol, 2,048, 64.92; Ciruela Caroline W. De Kol, 1,852, 64.26; Miss Aaggie O. S., 2,172, 64.07; Annie Langtry DeKol, 2,016, 58.27; Mutual DeKol Johanna, 1,717, 56.50; Sarcastic Blanche C. De Kol, 1,931, 55.43.

Nate Hauck, grades: Brindle, 1,903 lbs. milk, 79.93 lbs. fat; Red, 1,503, 70.64; Chub, 1,618, 69.57; Nigger, 1,333, 62.65; Brownie, 1,131, 56.55, Slow, 1,162, 55.78; Speck, 1,426, 55.61; Beauty, 1,221, 54.95; Lily, 1,348, 53.92, Bird, 1,240, 52.08; Bally, 1,627, 52.06; Ring, 1,206, 50.65; Strap, 1,069, 50.24.

C. D. Hayworth, Jerseys: Lorna of Rico V., 1,454 lbs. milk, 55.54 lbs. fat.

Peter Iversen, grades: Old Jersey, 1,054 lbs. milk, 62.19 lbs. fat; Kicker, 1,355, 56.91; Marcella, 1,128, 54.14; Red, 1,135, 53.35; Poor, 1,132, 53.20; Freddie, 1,017, 51.89; Yellow Jersey, 970, 51.41; Old Red, 1,200, 50.40.

C. D. Kennedy, Holsteins: Salma Bess DeKol L., 2,220 lbs. milk, 63.03 lbs. fat.

Los Angeles County Farm, Holsteins and grades: Whittier Pontiac N. IV, 1,712 lbs. milk, 68.99 lbs. fat; Tuolumne, 2,280, 55.88; Trinity, 1,996, 55.80; Princess, 1,274, 50.96.

Palo Alto Stock Farm, Holsteins: Kiatta Pontiac P., 3,313 lbs. milk, 85.48 lbs. fat; Thelma Hartog S. DeKol, 2,360, 78.82; Irene Segis Pontiac, 2,059, 76.40; Alta Pappoose, 2,158, 72.92; Alta Johanna Princess, 2,064, 71.83.

F. F. Pellissier, Holsteins: Princess Tolia W., 1,814 lbs. milk, 64.76 lbs. fat; 2403, 1,646, 60.90; 2479, 2,238, 60.43; Mamie Pontiac, 1,386, 54.61; 1917, 1,581, 53.75; Brudorin, 1,460, 51.10; 2423, 1,727, 50.08.

M. L. Pontoni, grade Jerseys: Paddy, 1,377 lbs. milk, 70.23 lbs. fat; Klamath, 1,376, 68.80; Rolley, 1,472, 66.24; Mousie, 1,419, 58.18; Meschini, 1,336, 57.45; Berne, 1,370, 56.17; White Tail, 1,171, 55.04; Margaret, 1,069, 54.52; Arcata Girl, 1,209, 54.41; Mabel, 1,357, 52.92.

H. F. Richards, Jerseys: Victor's Lady Queen III, 1,255 lbs. milk, 64.23 lbs. fat; Teddy R's Silver Beauty, 1,214, 58.86; Teddy R's Poppy Girl II, 976, 53.86.

Olga Saxer, Holsteins: Moorland Colantha Rose, 2,065 lbs. milk, 58.85 lbs. fat.

W. Terkelsen, grades: Dinah, 1,451 lbs. milk, 76.90 lbs. fat; Christina, 1,293, 65.94; Amy, 989, 64.29; Laura, 1,283, 62.89; Annie, 1,085, 60.76; Pale Face, 1,693, 57.56; Ethel, 961, 54.78; Evelyn, 1,262, 54.27; Lucy, 1,088, 51.14; Friday, 874, 50.69.

H. L. Wakeham, grade Jerseys: Big A, 1,060 lbs. milk, 63.07 lbs. fat; Brown Jersey, 1,277, 57.47; Jim's Wonder, 1,376, 53.66.

R. H. Walrath, grades: Anne, 1,262, 60.58; Minnie, 1,066, 50.10.

Warner & Sons, Holsteins: Fayette Segis, 1,483 lbs. milk, 55.16 lbs. fat.

The reports for July so far received show that 518 cows in milk during the full month produced an average of 1,071 pounds milk and 47.04 pounds butter fat (average number of days in milk at the beginning of the month, 149). Two cows produced above 80 pounds butter fat during the month, 18 produced between 70 and 80 pounds, and 43 between 60 and 70 pounds.

The prize offered by the California Cultivator for the highest average production by five grade cows for the month of July was won by Walter Terkelsen of Humboldt County. Five grade Jerseys in his dairy herd produced on the average 66.16 pounds butter fat during the month (average milk 1,220 pounds, test 5.42 per cent, distance from freshening, 96 days). The production of the individual cows ranged from 60.8 to 78.9 pounds butter fat. These grades stood first among similar groups in 23 herds in different parts of the state that competed for the Cultivator prize during the past month. The average production of all but seven of these groups came above 50 pounds, the lowest producing grades averaging 19.97 pounds fat. Five grades owned by the following dairy farmers produced on the average over 50 pounds butter fat during the month, viz: W. Terkelsen, 66.16 pounds; M. Pontoni, 64.18 pounds; J. A. Genzoli, 63.45 pounds; W. F. Early, 60.82 pounds; E. Graham, 59.97 pounds; E. Biondini, 59.33 pounds; L. Christen, 57.75 pounds; N. Hauck, 57.58 pounds; P. Iversen, 55.96 pounds; Arden Certified Dairy, 52.44 pounds; W. B. Gries, 52.15 pounds; J. A. Harbers, 51.53 pounds; Adohr Stock

Farms, 50.95 pounds; H. L. Wakeham, 50.53 pounds; Giacomini & Pedrotti, 50.56 pounds; F. F. Pellissier, 50.03 pounds.

The following cows have now completed the record period of ten months (305 days) in the competition. They are given in the order of their owners, alphabetically arranged:

No.	Name of Cow.	Age Yr.-Mo.	Days in Milk beg. of Record	Milk Lbs.	Butterfat Pct.	Butterfat Lbs.

SALE OF STOCK AT SOUTHERN CALIFORNIA FAIR

A sale of show stock is being planned and worked out by the Southern California Fair at Riverside, October 11 to 16. The object is to promote and in every way encourage the personal, direct sales of all classes of livestock at this fair. A catalogue will be published and circulated before and after the fair and a general system of advertising will be inaugurated to popularize this effort. Exhibitors are asked to consign as many of their show animals as they wish. These will be catalogued and advertised. There will be no auctioneer or ring sale and no expense to the consignee except the cost of space in the catalogue, which will be at a low figure. Already there have been a large number of consignments and the indication is that this new departure in promoting sales at fairs will be a marked success. The Southern California Fair has always been a farmers and ranchers fair and this matter of promoting sales will be an additional encouragement for farmers' attendance.

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years	2,040.97 Pounds
Milk	2 Years	41,547.20 Pounds
Butter	1 Year	1,130.66 Pounds
Milk	1 Year	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days	30.47 Pounds
Milk	7 Days	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

OWNED JOINTLY BY
Fred Hartsook LANKERSHIM, CALIF. and A.W. Morris & Sons Corporation WOODLAND, CALIF.

If You Are Growing Shorthorns,

grades or pure breds, now is the time to carefully cull your herd, dispose of the least desirable and add a few that will raise the standard. Make your herd better.

SIXTY-SEVENTH ANNUAL STATE FAIR

(Continued from Page 255)

vada. On the way there are many opportunities for the development of hydro-electric power. These opportunities she has used and is now considering still further development through use of some of the power now wasting in the Colorado River. This, in connection with other communities, private companies, and under direction of the reclamation service of the U. S. government. This exhibit visualizes the city's great accomplishment and in addition is featured with many striking electrically lighted views. The exhibit is in charge of Charlie Bayer, secretary Pomona chamber of commerce, and L. E. Moselle of Los Angeles bureau of power and light.

The fish and game commission occupies its old location, and almost as much more. It has been built out into the open and enclosed with a greater number of cases containing rainbow trout, in fact, all the fish of California streams.

Coming up the east side, we first see Santa Cruz County's exhibit of apples, which make up one of her greatest products, and a series of remarkably fine photographs of scenes taken in her big tree groves.

Tulare's citrus exhibit attracts attention perhaps first of all to her remarkably fine grapefruit, then Valencias, lemons and particularly Lily Lucerne. Lily is a remarkably fine looking girl dressed in alfalfa, calling attention to Tulare's 100,000 acres of alfalfa, and Lily has with her her pet, a beautiful representative of the dairy.

The big feature of Colusa County is rice; green rice, paddy rice, and in all forms of manufacture. Then there are sorghums, broom corn, and general farm products. Lemons, some of the handsomest ever grown, have come in from the Mills ranches up against the western foothills. Prunes, monsters, almost a wagon load (in fact, 25 orchard boxes) are shown, guaranteed every one to be from a single tree only ten years old. Colusa is some prune county.

Kern shows plenty of oil derricks, but more, a scene along her eastern foothills with hills made of citrus and other fruits. It is a striking exhibit in relief designing, and all made more attractive by running water tumbling into pool at its lower edge.

Turning down the western side of the hall, nearest the door comes Humboldt. Every resident of Humboldt is proud of that exhibit. There are Winter Banana apples, wonders in quality, beautiful to look upon and placed so as to bring out their fullest beauty. Then there are some 60 varieties of apples in commercial packages, five boxes to the lot. Every one of these apples, even the Gravensteins, are direct from the tree, that is, not an apple from cold storage. Not entirely agricultural, but still made possible by agriculture, is Humboldt's exhibit of manufactured woolens. There are some wonderful blankets and suitings, which many of us did not suppose were made in California. Humboldt woolens will not be affected by the Truth-in-Fabrics act.

And San Francisco is here—first time ever. She is hardly in the agricultural class, and yet there are some for-sure agricultural exhibits. Many of these are from the county poor farm. This exhibit is largely featured by the board of health and its various divisions.

Way down in the corner is the exhibit of California's northermost six counties; Modoc, Lassen, Siskiyou, Shasta, and Tehama, and they show some wonderful products of "Air, Soil, Water and Climate." Recreation op-

portunities in the wonderful forests and by the stream sides are also featured. Honey, apples, alfalfa are exhibited in abundance.

Sacramento County has always acted the big brother part in this matter of competing for prizes. She has acted the host, and said "Boys, go to it, do your best, win the money, and we'll put up a show to make you all hustle." And Fred Brosius has done it. He is still in charge of the exhibit, and it's a beauty in three sections. The center is a monster plate glass case with nearly all kinds of fruits within. We don't know that we have seen anything bigger in the whole state fair than Fred's onions, and he has a radish there something like a yard long and a crook-neck squash hardly large enough for some of us to live in, but big enough for some whole families of fairies. Then there are beans, corn, pumpkins, celery, nuts and Sacramento river pears—wonders and beautifully exhibited.

The awards are yet not made and may not be for some days. There is a big job for the judges.

I have only touched one building. The train is waiting to carry this to the Cultivator office. "The boys" will handle the livestock and everything else next week.—C. B. M.

COOPERATION PAYS ALL ALONG THE LINE

"Never before has the interdependence of the country and city, of agriculture and industry, been so forcibly emphasized as during the last few months," J. A. Craig, president tractor division of General Motors Company, declares.

He says: "The present economic condition, resulting from post-war deflation, proves conclusively that the farmer is just as dependent upon the city as the city is upon the farmer. In the highly specialized system of American civilization no one class or group can prosper independently of the other groups.

"When the farmer refuses to buy, or is unable to buy, factories close down, working men are thrown out of employment, the consumption of food drops, the prices of farm products drop lower and lower, banks refuse to lend money and call in their outstanding loans, and business is at a standstill.

"The farmer is dependent upon the city worker to buy what he raises. The manufacturer is largely dependent upon the agricultural communities to buy what he makes and if his goods are not sold his employes are thrown out of work and their buying power is crippled, which immediately affects the sale of farm produce, banks tighten up and the condition becomes worse than before.

"Thus, we have an endless circle of dependencies — which explains our recent business depression.

"Right now, everyone wants business to open up, but most of us wait for the other fellow to make the first move.

"Mind you, I am not saying that the fault is with the farmer or the manufacturer or the banker or the dealer or any other one class. It's everybody's fault; it's everybody's problem; and if everyone will do his full share without waiting to see what the other fellow is going to do the problem will soon solve itself.

"The farmer should buy what he needs. This is nothing more than common sense, because if a man really needs a thing he pays for it whether he buys it or not. Credit, as applied to so basic an industry as agriculture, should be stretched to the limit.

"The manufacturer should do everything within his power to keep the wheels of industry moving, even though it may be necessary to temporarily operate at a loss. By so doing he is keeping the city man employed, thereby insuring his purchasing power and safeguarding the future of the manufacturer's own interests.

"Of course, when you come right down to it, few of us are really philanthropists at heart. We Americans of the great middle class, including farmers and implements dealers, are more interested in our own little problem than in the matter of 'saving the country.'

"But, it isn't a question of philanthropy. It's a question of good business, a question of doing a thing because it will pay, a question of constructive selfishness. And I'm not trying to pass the buck to the other fellow. Right now, we are lining up our business in accordance with this prescription."

SELECTION OF BELTS

The belts which are ordinarily used on the farm machines are usually either of stitched canvas, rubber or leather.

In the stitched canvas belt, cotton is the material which is generally used in the making. Several layers or plies of cotton duck are overlaid upon each other and sewed or stitched together so as to increase the strength and prevent excessive stretching. They are sometimes impregnated with oils or greases and are painted with an elastic paint so as to further increase their durability.

Rubber belts usually have cotton duck as a backbone, the duck being laid up in several layers and thoroughly impregnated with a rubber compound forced into the plies and vulcanized under terrific pressure, which unites the rubber and the duck into one practically inseparable body. Rubber belts are not affected materially by atmospheric conditions, though they are likely to be injured by oils or greases.

Leather belts are perhaps the most expensive. The best leather belts are made of the hides of four year old steers killed in the fall, and only the center back strip from the hide is used. Leather belting can be made as heavy and as wide as desired, and can be kept in good condition by being dressed with a mixture of two parts of tallow and one of cod liver oil. Neatsfoot oil can also be used on leather belts, but it will injure rubber belting.

MESQUITE POSTS

The U. S. department of agriculture, Washington, D. C., will mail free to those interested Farmer's Bulletin 1197, "Protection of Mesquite Cordwood and Posts from Borers." Certain borers completely destroy mesquite wood in a few months after it is cut, causing great loss and inconvenience. Wood cut for fuel is commonly piled in wood yards or along railways. In such locations it is subject to borer damage from February until October and is not infrequently reduced to a worthless pile of sawdust and honeycombed sticks. Fence posts are damaged by sapwood-feeding forms in such a way that staples become loose and the posts must be constantly replaced. It has been found that by cutting fuel wood at certain seasons and turning more valuable products in the sun practically all insect damage can be prevented. One of the homely hints given in the bulletin is: "It has been found that extreme heat prevents attack and kills the grubs which may be in the sapwood. Therefore, the best method for treating posts and more valuable material that has to be cut between March and October is to lay them flat on the ground in the sunlight, then after two weeks turn bottom side up and repeat the turning two weeks later. Two turns in six weeks are sufficient to kill the grubs or prevent attack. This method can be used effectively only between April 1 and October 1."

The poultry show at Riverside this fall will exceed in size and importance any feathered exhibit shown in the state this year. Besides having a complete show in all the prominent breeds of chickens, there will be the largest show of bantams that has been made this year, and in addition a wonderful show of pigeons. This is the tenth annual poultry show for Riverside, and in those ten years the records show some wonderful exhibitions. But for numbers and quality the show this fall will exceed any previous effort. A large number of new coops are being provided, and more space will be used than ever before.

In the past two years the Southern California Fair at Riverside has earned the reputation of presenting the largest show of milk goats ever made. Not only has this show been great in numbers, but some of the finest animals in the United States have been on exhibit here. The show this fall promises even to exceed that of last year and the year before. The same committee are at work and have received such encouragement from prominent breeders of milk goats of all varieties that they are able to assure a still better show than previously.

The rabbit industry in Southern California is evidently receiving a renewal of interest and activity, as the management of the Southern California Fair has received information from committees at work that it will require, to house their exhibit this fall, more hutches than they have ever needed before. A special building is provided for this exhibit, and it will be one of the attractive features of the fair.

The race meet at the Southern California Fair this fall promises to exceed that of last year, which was reputed to be the greatest meet on the coast last season. The best horses in the various circuits throughout the entire coast are planning to come to Riverside. Large purses have been hung up in the various events, and five days of lively racing are promised.

The Imperial County farm bureau has named its committee to cooperate with similar committies of business bodies of the valley to investigate the Boulder Canyon farm project. The members are Sam P. Rowe, Westmoreland; C. W. Brown, Calipatria; R. H. Clark, El Centro; Benjamin Vlier, Calexico; W. R. Farmer, Holtville.

The California Packing Company will soon have a new cannery operating at Santa Ana.

DISPERSAL SALE

37 Registered Holsteins 37

Owned by JOHN SAXER

Modesto, Cal., Wednesday, October 12

This is one of the choicest herds in Stanislaus County, and for type ranks as one of the most attractive in the state. Splendid production records are also present, as well as popular breeding.

COWS WITH OFFICIAL RECORDS up to over 31 lbs. butter in 7 days.

THREE DAUGHTERS OF SIR SKYLARK ORMSBY HENGERVELD, the famous sire of great producers, among his daughters being the twice 34 lb. cow Gerben Abbekerk Maid.

A DAUGHTER OF THE GREAT HEIFER MOORLAND COLANTHA ROSE, sired by a 32 lb. son of King Mead of Riverside.

Guaranteed breeders; tuberculin tested and sold subject to retest by the buyer.

Catalog free on request.

WIPE OUT EVERY RAT AND GOPHER

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch—old, young, big and little. A single pair left, in a short time, will produce enough to overrun the place. That's why we say KILL THEM ALL.

Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings and property. They are filthy, dangerous, destructive, disease carriers. Wipe them out—not just one or two at a time—but the entire colony.

Easy to Get Every One

A new scientific discovery, called Imperial Virus, now enables you to rid your place of every rat, mouse and gopher easily, quickly, entirely, without trouble, muss or danger. It is absolutely guaranteed to clean out every one of them.

Not a Poison

Imperial Virus is absolutely harmless to humans, domestic animals, poultry, etc., but is sure death to rodents, and rodents only. Fed to them on bread, grain, etc., it gives them a fatal disease, which they give to others and are all wiped out. Best of all, they die outside, hunting water and air.

You can spread this Virus in your chicken house, around gopher mounds, anywhere, knowing it cannot possibly harm any fowl, dog, cat or other domestic animal.

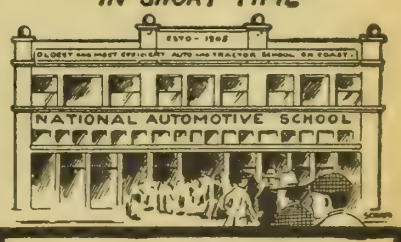
Get Yours Free

The manufacturers of this amazing Virus are anxious to get immediate distribution everywhere and make this big offer. (Act now or clip this offer for future reference, as it may not appear again.) Send $1.00 (bill, money order, check, etc.) to the Imperial Laboratories, Room 138, 2110 Grand Ave., Kansas City, Mo., and you will receive two regular full sized (double strength) $1.00 packages, postpaid. Use one bottle to rid your own place of these pests. When you see how easy it is, tell a neighbor about it and sell him the extra package, making your own cost you nothing. You will be told also how you can make money by telling your friends about it. You need send no money. If you prefer, simply pay the postman $1.00 and postage when you get the two packages. If you are not satisfied after thirty days your money will be refunded.

EARN BIG MONEY

BATTERY & AUTO IGNITION — MEN IN BIG DEMAND....

LEARN IN LOS ANGELES IN SHORT TIME



Throughout the entire period of financial depression, Los Angeles has been the one bright spot on the business map. Business is good here, and skilled mechanics and ignition men are in great demand at big wages. Never before have such wonderful opportunities been available to earn up to $400.00 per month. Learn the big paying Auto and Tractor trades under ideal climatic conditions in the largest and oldest mechanical institution on the Pacific Coast. (Est. 1905). Complete instruction in Auto Repairing, Ignition Work, Battery Work, Driving, Machine Practice, Vulcanizing and Tractioneering. Three big instruction buildings; every modern equipment. Tools Free. No extra charges. You can earn board and room while learning. Over 9,000 satisfied graduates. Write today for free illustrated Catalog of Facts.

Coccidiosis

By Jean A. Koethen

THE cause of coccidiosis is a matter on which the people who tell us how to cure it have very little to say. They tell us it is an infectious disease "caused by protozoan organisms known as coccidia" which may exist in small numbers in the intestines without causing apparent harm, but when present in sufficient numbers they destroy the mucous membrane lining the intestines and cause death. When we ask them what causes the fatal multiplication of these organisms they shake their heads and mumble something about "bad management" or "infected soil."

Cause

Now, there must be a cause, of course, and if the lay mind dare intrude on what the experts will not face, it amounts to this:

Coccidiosis is a disease which is rarely or never seen except in large flocks, and most frequently it occurs in flocks that have been kept on the same soil for several years. The soil may have been purified by a green crop between hatching seasons, but the chicks have run in the same yards and slept in the same houses year after year. Under such conditions what happens? This year an occasional chick drops off with the disease, due, perhaps, to its getting more or less than its share of the chick ration, or to a drink of water fouled by droppings or to a want of that immaculate cleanliness which is the first desideratum in chick culture. Nobody pays much attention to the death of a few chicks, that is expected; but the soil is contaminated by its droppings just the same, and the coccidia which were originally harmless residents of the sick chick's intestinal tract become dangerous inhabitants of the ground which 900 other chicks are running on. This year the whole 900 may escape, but next year's flock, running on contaminated ground, may all be affected.

I have no idea whether it is possible ever to raise chicks on contaminated soil without some cases of coccidiosis, but I do know I should not wish to try. Why, when there is as much unoccupied land as there is in California, should anyone ever undertake to raise chicks on soil he knows is contaminated? Of course, there is the difficulty of moving brooder houses and all that, but a portable brooder house which may be moved each season to freshen soil in orchard or garden would not be hard to devise. The flock would have to be broken up into smaller units, but what of that? Some wise chick raisers have already discovered that it doesn't pay to raise more than one flock on the same ground in a single season, but there are others who run one lot of chicks after another, four or five weeks apart, through their brooder yards, and still wonder that their chicks get coccidiosis.

Symptoms

"Coccidiosis is seldom seen in chicks that are under two weeks or over four months of age," says Dr. Beach of the poultry division. "The usual history of outbreaks of the disease is that the chicks do well until they are a few weeks old, when they begin to look unthrifty, droop and gradually die. It is not at all uncommon for entire flocks of chicks to die in the course of a month or six weeks. The symptoms of the disease do not differ materially from those of some other diseases and are therefore merely suggestive of coccidiosis. The feathers of sick chicks become ruffled and soiled; there is a marked paleness of the skin of the head and of the visible mucous membranes. The sick chicks are inclined to separate themselves from the rest of the flock and stand humped up with their eyes closed for hours at a time unless disturbed. Usually diarrhoea, which is sometimes bloody, is present. A bloody diarrhoea can be considered as positive evidence of coccidial infection. Chicks usually show symptoms for at least three or four days before death occurs." In regard to infection Dr. Beach says: "Coccidiosis is spread by the organisms which pass out with the droppings of diseased birds. Other chicks become infected by drinking water or eating food, litter or particles of soil contaminated by the droppings of diseased chicks. It has been demonstrated that these organisms will remain alive in the soil for a year or more. Therefore chicks that are allowed to run in yards in which infected chicks were kept the year previous are very likely to become infected."

Control

It has been found that a liberal use of buttermilk or clabbered sour milk is the best cure. Hydrochloric acid in the drinking water, a teaspoon to a quart of water, sometimes gives good results if milk is unobtainable, but milk should be used if it can be obtained.

In order to make the chicks drink as much sour milk as is necessary, the mash must be limited. "Feed a small amount of grain night and morning," is Dr. Beach's advice. "Feed mash during the middle of the day, never leaving it before the chicks longer than two hours. Feed greens as usual. Keep buttermilk in fountains constantly before the chicks. The restricted grain ration will keep the chicks hungry and they will consume large quantities of buttermilk. If too much grain and mash are fed and the chicks drink large quantities of buttermilk sour crop is very liable to result. There is no danger of this occurring, however, if the amount of grain fed is small."

In addition to change of diet, most careful sanitary measures are necessary. The chicks should be moved to new ground if possible. If not, the ground of the yards should be spaded and the houses thoroughly cleaned and disinfected. Fresh scratching litter should be spread on the floors daily and swept out and burned every day. Feeding troughs and water fountains are best disinfected with boiling water.

"In most instances, if the above sanitary measures and feeding method are carefully followed, improvement will be noticeable in three or four days, and all signs of the disease will have disappeared in from two to four weeks. The buttermilk will cause the droppings to be somewhat watery, but this should not be considered at all dangerous." The above feeding methods should be employed from the start, when chicks are put in houses and yards in which a flock infected with coccidia was kept the year before."

Prevention

After all, prevention is a good deal simpler than curing, and prevention would seem to demand:

Clean soil. Better brood your flock in a tent with only boxes to sleep in and clean ground to run on, than have it decimated by this plague of large flocks. Dead chicks are very expensive.

Clean houses and brooders. It is a singular thing that coccidiosis never appears before the chicks are two weeks old. When things begin to get a little dirty, then the chicks begin to droop. Can you read the moral to that?

As much room for each chick after two weeks as before. A healthy chick nearly doubles its weight in three weeks. If it has not twice as much brooder room then as it had at the start there will be more filth, less chance for comfortable sleep, danger of a let-down in vigor, which is often the first step toward any kind of infection.

Suitable food. Beef scrap should not be used the first ten days. It is a good plan to begin with a mixture of

ran and rolled oats, and then to gradually add corn meal, beef scrap and ther ingredients, but as far as I can arn, the poultrymen who use a comercial mash after the first week do uite as well as those who mix their wn. The little chick requires hard rain, mash, greens and grit for grindng them. Just exactly what mixture hall be used is not as important as leanliness, a chance to exercise, unroubled sleep; in short, the favorable nvironment which keeps digestion ormal.

Poultry Queries

(Conducted by Jean A. Koethen.)

Distinguishing Sex

How can we tell which are pullets nd which are roosters in six to ten nonths old chickens? We don't know nything about chickens and they all ook alike to us. We are at a loss to now just what we are buying.—Subcriber, Long Beach.

The rooster stands higher on his legs and has a high, upstanding comb, quite different from the loppy comb of most White Leghorn hens. His tail should be longer and have more of a sweep, but this might not be the case in a "squirrel-tailed" rooster. If you are buying chickens and are not sure of being able to distinguish sexes the safest way would be to go to some disinterested poultryman and ask him to show you the differences, which are not as marked in Leghorns as in the heavier breeds. Once you have the shape of the two sexes clearly in mind you will never forget it.

Roup of the Eyes

One of our turkey hens has become blind in one eye. The eyeball is covered with a growth that looks like cottage cheese and protrudes from its socket a sixteenth of an inch. I washed the eye with lysol water, which removed some of this whitish substance. —Subscriber, Pond City.

This is a good description of roup of the eyes. Washing with lysol water, a creolin solution, a solution of boric acid and chamomile flowers or with peroxide of hydrogen diluted 1 to 3 times with water will remove the exudate temporarily, but it is liable to return repeatedly. If you do succeed in effecting a temporary cure by the use of one of these washes twice a day better kill the bird and eat her before she has another atack. If she does not soon improve, kill her anyway and bury her deep. The axe is the only cure for roup.

SIX WEEKS' COURSE IN POULTRY RAISING

Because of the recent slump in egg prices stress will be laid on the profits per hen in the study of poultry farm management in the six weeks' course to be given in poultry raising. The course, which is to be given at the University Farm School at Davis, will begin September 26.

YEAR BOOK

The Year Book of the U. S. department of agriculture for 1920 is rather later in being issued than formerly, and it gives a distinct shock to its old time readers because of its greatly changed appearance. The change is for the better, and the binding is more like that of a "real book" so that there can be only commendation, yet for those of us who like to keep things as they were in the olden days it is with somewhat of regret that we unwrap the new volume. Instead of the purple or bluish color which has been used since about 1890 it is now bound in a buff buckram. Likewise on the back of the book former volumes have had "Year Book of the Department of Agriculture 1919" while it now simply has the "United States Department of Agriculture," and lower on the back, and much smaller, "Year Book 1920." The binding, the quality of the paper, the halftone illustrations are all wonderfully attractive. The book is about 100 pages larger than most of the preceding numbers, having 888 pages. The first 84 pages are given up to the report of the former secretary, E. T. Meredith, then something over 400 pages to special illustrated articles touching upon European corn borers, home demonstration work, preservation of woods, conserving wild animals and birds, pig thumps, irrigation, phosphorus, breeding and feeding to prevent runts, boll weevil, helping the landless to own farms, good roads, standardization and the farmer's interest in foreign markets. There are over 300 pages in the appendix giving tables, lists of livestock associations, statistics on corn, wheat and other grains, hay, tobacco, fruits, sugar and practically all products of the country.

It is probable that Cultivator subscribers may secure this book by writing to the member of congress representing the district in which the subscriber lives, also the United States senators representing this state will supply the book.

ISLE OF PINES

United States Consul Charles Forman, stationed at Nueva Gerona, Isle of Pines, reports:

"By far the most important foreign commerce of the Isle of Pines is with the United States. This is especially true in regard to exports, as grapefruit and winter vegetables grown for the American market are the principal products of the island. No sugar or tobacco is produced, and there are no important manufactures. Almost all the manufactured articles locally consumed are the product of the United States and are purchased partly in the United States and partly in Habana. Among these may be mentioned fertilizer, foodstuffs, agricultural implements, hardware, motor vehicles, gasoline and dry goods.

"An interesting minor export to the United States is that of parrots, of which from 1,500 to 3,000 are annually exported to the United States and find a ready demand throughout the country. The price paid per bird is from $1.10 to $1.35, according to size and plumage."

AMERICAN TRACTORS IN FOREIGN FIELDS

In the same way that American automobiles have come to dominate the world's automobile market, so are American made tractors successfully invading every foreign field. Great Britain and continental Europe are using thousands of American machines for farm power purposes, and they are proving the most popular even in spite of the extensive advertising and assiduous propaganda being carried on in favor of homemade articles.

Demonstrations are very popular in foreign countries. They are usually considered very serious affairs by the prominent farmers and often are given a semi-official standing due to the participation of local officials as observers and testors.

OTHER QUALITY PRODUCTS

especially prepared for use on the farm.

Oronite Roof Paint

A high-quality protective coating for prepared roofing and metal roofs.

Mica Axle Grease

Gives a durable, smooth lubricating film under every pulling condition. Keeps the axle cool; no hot-boxes, no gumming. The MICA makes it better.

Eureka Harness Oil

Preserves the original strength and life of leather and keeps it soft and pliable. Keeps harness "new looking."

Standard Hand Separator Oil

Correct Lubrication for your Hand Separator, under the conditions of high speed and close fitting parts.

Before *the rains start again*

Examine your shingle roofs. They need protection to successfully come through the heavy rains of another year's weather.

ORONITE SHINGLE OIL
Preserves Shingles

Oronite Shingle Oil is a high-quality preservative for all shingles (either on roofs or on side walls)—to make shingles last longer through drenching rains, whipping winds and hot, drying sunshine.

Oronite Shingle Oil penetrates the fibre of the shingle with a moisture-resisting preservative that retards the evaporation of natural oils in the wood—the cause of cracking and warping—and counteracts the effect of age and exposure.

Oronite Shingle Oil is especially prepared to make shingles withstand continual exposure. It will keep your roof in good condition and give it longer life. An application of Oronite Shingle Oil to an old roof *now* may save the cost of repairs or an entire new roof next season.

You can mix Oronite Shingle Oil with colors and obtain an attractive stain and all the advantages of this shingle preservative. Ask our nearest agent for color formulas.

Cantaloupes: Supplies heavy, demand and movement moderate, market weak Homegrowns: Tiptops, per crate, 40@60; Paul Rose, 40@60; Rocky Ford, 40@60. Casabas: Supplies liberal, movement slow, 1@2 per lb., according to quality.

Figs: Supplies liberal, market stronger. Locals: Per box, 1.00; few, 1.25@1.50; poorer, 50@60; small boxes, 75@1.00; poorer, 65.

Grapes: Supplies liberal, movement moderate, market firm. Wide range in quality. Muscats, 4@5; Tokays, 8@9 per lb.; few fancy Hamburgs, 5@5½; Concords, 10 per lb.

Peaches: Supplies heavy. Demand moderate, market firm. Freestones mostly 1.00@1.25; few fancy, 1.50@2.00; poorer, 60@90; Clings, fy., 1.25; Salway, 5.

Pears: Demand and movement good, market firm. Bartletts mostly 5@6; few fancy, 7; poorer, 4 per lb.

Prunes: Supplies light; demand limited; market dull. Various varieties, 3@5 per lb., mostly 5, according to quality.

Quinces: Lug, 90@1.00.

Watermelons: Supplies very heavy. Demand slow, market steady. Locals: Klondikes mostly 1 per lb., poorer, ½@¾ per lb.

CITRUS FRUITS

Grapefruit: Supplies liberal, movement moderate, market firm. Local: Per box, market pack, mostly 2.50@3.00; smaller, 2.25; few best, 3.25@3.50.

Lemons: Supplies liberal. Demand moderate, market dull. Local: Market pack mostly 3.00@3.50; few, 4.00; loose box mostly 2.00@2.25; poorer, 1.50; lug, 50@75.

Oranges: Supplies moderate. Demand moderate, market firm. Market pack 3.00@3.50, small sizes 2.25@2.75, loose pack 1.00@1.50, mostly 1.00@1.25.

HONEY

Supplies of white honey nearly cleaned up account short crop and good demand. Production of fancy grades considered only 25 per cent of normal. Moderate supplies of other grades new crop but old crop supplies nearly exhausted. Light nectar flow from beans anticipated. Demand fairly active past two weeks and prices advanced slightly. Market firm at present. Carload f. o. b. usual terms at loading points. White orange, 10½@11¼; white sage, 9½@11; light amber sage, new crop, 7@8; old crop, 7; light amber alfalfa, new crop, 5¼@5½; old crop, few sales, 5½. The quality of new crop alfalfa and sage said to be variable, due to the unfavorable season. Beeswax: Supplies moderate, demand light, market weak. Growers receiving 22@23; dealers asking 25 for crude wax.

GRAIN AND FEEDS

Grain Exch. price bid September 6:
Barley: 100 ton lots, Dec. del., 1.30.
Milo: 100 ton lots, 1.55.

HAY

Alfalfa Growers of California report:

Demand showed further improvement in nearly all parts of the state. Prices firm, ranging same to 1.00 higher.

We have secured a credit of $300,000, and more if considered necessary, for making loans to member growers, to be used as needed. The money will be handled by the state exchange, working through the local associations, who will loan to individual growers with their hay as security, loans to be paid back out of the proceeds of the hay. Applications for information and loans will be made to district association.

Demand for fertilizer hay increasing, best prices paid where it has been used longest. We made sale of 200 tons this week in Riverside at $20 a ton, chopped, grove delivery; chopping cost $2 a ton. Since the fertilizer question is becoming even more serious in deciduous fruit districts Southern and Central California, it appears probable that alfalfa hay will also come in use there as fertilizer before long. We are receiving inquiries. Such a general use would mean demand in which quantity would cut no figure; the only limit would be the price.

There were 570 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending September 3, with 190 tons held over.

Prevailing prices last week f. o. b. Los Angeles:

No. 1 Dairy	20.00
Standard Alfalfa	16.00

Quotations by Nichols - Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	20.00@24.00
Standard	16.00
Straw	8.00

San Francisco Markets

San Francisco, Sept. 6, 1921.

Blackeyes	4.15

HOPS

From 14@23 per lb. for 1920 California crop; do, 1921 crop, 26@30½, according to quality and district in which grown.

HAY AND FEED

Under date of September 3, A. W. Scott Co. says:

Receipts during week 1,985 tons, compared with 1,336 last week. The heavier receipts have caused a corresponding heaviness in handling the hay in the city, as business is so light and the demand so reduced that a little increase or decrease in the supply on the market is readily felt. Prices have changed very little, however, and are not likely to do so until all the hay is moved in storage. Just as soon as one quality or another of hay becomes a little stronger, the pressure back of the market in the country of those anxious to have their crops brings it back to the low levels we have been maintaining. Export and coast shipping have been a little more quiet. Interior trading has diminished and slight reductions in price have been made. Alfalfa is probably most dull of any grade, and offerings at less than former prices have been made without result. Mill and dairy feed prices are unchanged, and the market continues dull.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay No. 1	15.00@18.00
Wheat Hay, fair grade	13.00@15.00

Citrus Markets

Los Angeles, September 7, 1921.

Orange growers are hoping for a good Eastern market this winter in view of the fact that last season's fruit was of such excellent quality. This, it is hoped, will offset the depression of the market caused by unemployment and slow business. Valencias are going forward at an average of 75 carloads a day.

Lemon growers who became discouraged over the poor markets and picked their crop and threw it away only to see their neighbors get sky high prices, now have prospect of getting good returns from their winter crop, which is in better condition because of that same picking and throwing away. A survey of the lemon market for the year shows good

Average returns. The outstanding need of the lemon industry is for stabilization in market, which can only be secured by elimination of foreign lemons by a protective tariff.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 36,446 cars; lemons, 10,265; total, 46,711. To same date last season: Oranges, 28,171; lemons, 7,513; total, 35,684. From Central California to date this season: Oranges, 6,649; lemons, 212; total, 6,861. To same date last season: Oranges, 5,381; lemons, 289; total 5,670. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 23; total, 284.

AT THE AUCTIONS

August 31

New York: 20 cars or., 1 car and 107 boxes lemons. Val. 2.35-7.00, lem. 4.50-4.75.

Boston: 12 or., 1 lem. Val. 2.95-5.60, grapefruit 2.45, lem. 4.20-4.75.

Cleveland: 3 Val. 2.90-5.40.

Pittsburg: 3 or., 1 lem. Val. 2.85-5.75, lem. 4.55-5.15.

Cincinnati: 1 or., 1 lem. Val. 4.50-5.05, lem. 5.40-5.80.

Philadelphia: 10 or., 1 lem. Val. 2.65-6.00, grapefruit 2.95, lem. 4.70.

September 1

New York: 26 or., 1 grapefruit, 2 cars and 375 boxes lem. Val. 2.60-6.75, grapefruit 4.40, lem. 2.90-5.20.

Boston: 11 or., 1 lem. Val. 3.00-5.10, lem. 4.00-4.20.

Pittsburg: 3 or., 1 lem. Val. 2.60-4.35, Nav. 1.75, lem. 5.75-6.35.

St. Louis: 3 or. 1 lem. Val. 3.15-4.85, lem. 5.80-6.35.

September 2

New York: 22 or., 1 grapefruit, 2 lem. Val. 2.70-7.15, grapefruit halves 1.40-2.00, lem. 4.40-5.00.

Philadelphia: 5 Val. 2.15-5.95.

Cleveland: 4 or., 1 lem. Val. 3.20-5.55, lem. 5.40-6.95.

Cincinnati: 2 or., 1 lem. Val. 4.40-5.20, lem. 4.95-5.15.

Pittsburg: 2 or., 1 lem. Val. 3.80-4.35, lem. 4.70-5.00.

September 6

New York: 40 or., 3 lem. Val. 2.55-6.95, lem. 4.60-6.75.

Philadelphia: 13 or., 1 lem. Val. 2.20-5.85, lem. 5.85-6.05.

Boston: 17 or., 2 lem. Val. 1.80-5.80, grapefruit 1.95-4.15, lem. 3.30-4.75.

Pittsburg: 6 or., 1 lem. Val. 2.77-5.00, lem. 7.45.

St. Louis: 4 or., 2 lem. Val. 3.40-4.35, lem. 7.15-7.80.

CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, August 29, 1921: Cattle prices declined on eastern markets somewhat last week, with exceedingly heavy receipts at most market points. Prices paid f. o. b. ranch in California, however, remained steady with a good demand particularly for feeder cattle. The Chicago market today showed a better demand for all classes of stock and an increase in price of three-quarters of a cent over the low point last week, making a net improvement over one week ago of one-quarter of a cent. Sales in Humboldt County are for 5½ cents for steers and 4½ cents for cows, f. o. b. ranch. It is estimated that approximately one-half the cattle available have been sold in Humboldt County. Sales are reported in Modoc County at 5 cents for steers and 4 cents for cows, f. o. b. ranch. Sales in Lassen and Shasta Counties at broad gauge loading points are reported at 5½ for steers and 4½ cents for cows, f. o. b. ranch. Offers are being made in Solano, Napa and adjacent counties, of 6 cents for steers and 5 cents for cows f. o. b. ranch. No sales reported.

Please report all sales of cattle as promptly as possible to the secretary of the California Cattlemen's Association. Do not ship on consignment. Make all sales f. o. b. ranch. Offer only your prime cattle for sale.—R. M. Hagen, Secretary.

COOPERATION THEN AS NOW!

Once upon a time, an Oriental legend has it, there lived a poor man in the little town of Noggi, by the River Nile. So preoccupied was he with the distressful circumstances to which his poverty had brought him that he went about the streets of the village beating his chest and bewailing his fate to the inhabitants.

And when by chance one of these, seeking to assuage his misery, saluted him in terms of hopefulness, calling attention to the beauty of the day or the good fortune that had befallen a brother villager, he immediately set about to drown out the salutation with increasing lamentations.

It so happened that the ground upon which this man's hovel was located, the sole legacy of his worthy father, stretched a fathom square along the marshy land bordering the river, and when the Nile rose the waters submerged his hut, and when they receded he was constrained to build him another, giving him periodic cause for his lamentations.

One day Sett, the sandal maker, and Beppi, the wine presser, who owned marsh lands on either side of him, sought him out as he was rebuilding his hut after the flood.

"Neighbor," said they, "if we but join our labor against the Nile we may check its ravages. Let us build a wall against the flood tide."

But the man only beat upon his chest and answered:

"Miserable me! Who am I that I should raise my arm against the Nile?"

COMING EVENTS

California State Fair, Sacramento, Sept. 3-11.
Fall River Fair, McArthur, September 7-9.
Escondido Grape Day, Escondido, Sept. 9.
San Joaquin County Fair, Stockton, September 12-17.
Tulare County Livestock and Agricultural Show, Tulare, Sept. 13-17.

California Association of Nurserymen Annual Convention, Exposition Park, Los Angeles, Oct. 20-22.
California Flower and Horticultural Exhibition, Exposition Park, Los Angeles, October 20-26.
Date Festival, Coachella Valley, Oct. 21-23.
California National Livestock Show, San Francisco, Oct. 22-30.
Pacific International Livestock Exposition, Portland, Oregon, Nov. 5-12.
Orange and Olive Exposition, Oroville, middle of November.
American Farm Bureau Federation Annual Meeting, Atlanta, Georgia, November 21-23.
Stanislaus County Poultrymen's Association Show, Modesto, Dec. 4-7.

So they went upon their way and built the wall and carried it away from the river along either border of the man's marsh land.

And when the flood tides came again and again his house was carried away by the waters, the market place of the town resounded afresh with his lamentations.

"Miserable me! Fortunate Beppi! Fortunate Sett! See, their houses stand. They be blessed of Heaven. But I, I am most miserable!"

WHAT USE CAN I MAKE OF A TRACTOR?

One of the first questions that a prospective tractor buyer should ask himself is "Can I use the tractor to advantage in work other than plowing?"

In general the answer is "Yes." It can be used for disking, seeding, harvesting, threshing, silo filling and in fact all belt work necessary to be done on the farm. It can be used in haying, in spreading manure, digging potatoes, grinding feed, baling hay, shelling corn, sawing wood; in road grading, stump pulling, rock removal, ditching, and in practically every place where power is necessary.

The joy of it all is that where common sense and good judgment are employed, it can be used to better advantage and more economically than almost any other type of power.

The George Junior Republic at Chino has an entry of 14 Holsteins at the Sacramento fair.

MAKES FARM LIFE ENJOYABLE

"Instead of arranging to buy more adjoining land, farmers should improve their present farms, put them in a high state of cultivation, and build attractive homes to live in," is the way J. W. Lick of Waldo, Kansas, 30 years a stock farmer of Osborne County, expressed himself.

"A few years ago I realized that I would not live always, and if I expected to get any real enjoyment out of life and have my family share in this enjoyment, I must get busy. I raised three sons and all reside near the old home. I have a residence lighted with electricity, equipped with hot and cold water, a bath and other modern improvements, and the whole family is enjoying life. If farm homes were made more attractive, fewer of our boys and girls would go to the cities."

SPLIT OR ROUND FENCE POSTS

Some people believe split fence posts last longer than do round ones. Probably as large a number hold the opposite view. The forest products laboratory of the United States department of agriculture says that one will last about as long as the other if the percentage of heartwood and sapwood is the same in both. If the percentage of sapwood is increased by splitting, the split post will be less durable, while if the percentage of heartwood is increased it will be more durable than the round one. Exceptions to this should be made if the posts are of spruce, hemlock or any of the true firs whose heartwood and sapwood are about equally durable.

If the posts are to be treated with creosote or some other preservative the round post is preferable to the split because of the comparative ease with which the sapwood can be treated. Experiments at the laboratory demonstrate that the heartwood faces on split posts do not, as a rule, absorb the preservative as well as does the sapwood.

PUT OUT THE FIRE

A camp fire not fully extinguished may be the means of destroying valuable timber which has taken hundreds of years to reach maturity. The reports of forest rangers are filled with dramatic accounts of the work involved in controlling such fires and in detecting and bringing the culprits before a judge after following the very slight clues obtainable in a deserted camp site. Sometimes an old bottle or a pocket handkerchief will reveal the original possessor who did not put out his fire. Sometimes a particular make of automobile tire can be traced for miles and the careless camper brought to justice.

No fines, however, will restore the burned area. While forest rangers are vigilant and alert to catch carelessness and prevent incipient fires, the real need, the foresters say, is for the development of more conscience on the part of the public which uses the national forests.

Be sure your fire is out!

INCUBATORS IN DEMAND

The Pioneer Incubator Company of Los Angeles reports sale to the Fanciers Exchange of 42 incubators for their Burbank Hatchery, 15 to the Wilmar Hatchery at Wilmar, 20 to the Harris Electric Hatchery, Los Angeles, 20 to the McLain Hatchery, Los Angeles, and 12 to the Coulson Hatchery, Santa Ana.

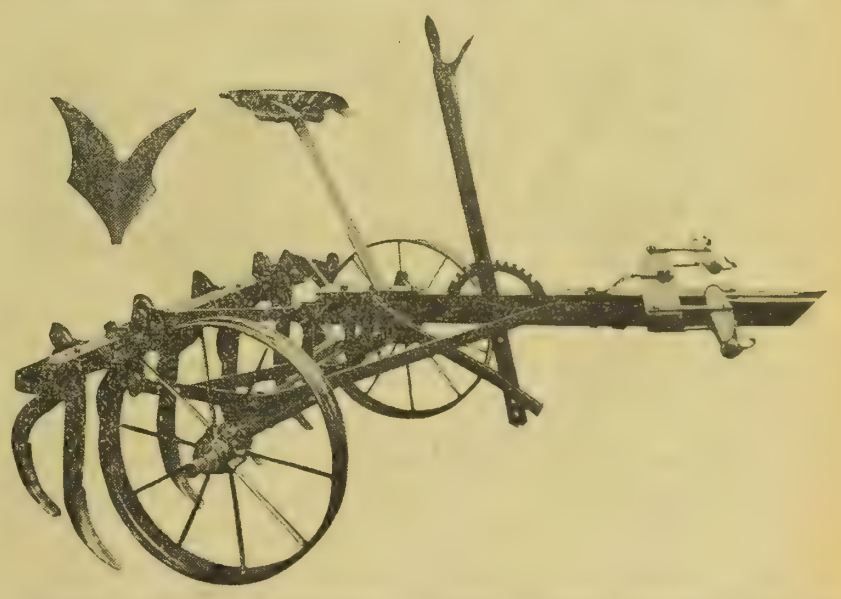
Important to Bean Growers

The handling of beans with a side delivery rake is certainly the most practical and economical way to handle the crop provided the rake used is properly built and properly geared for the handling of beans.

In the ordinary side delivery hay rake the cylinder is speeded entirely too high for beans. When the cylinder runs at a high speed the beans are handled so roughly that a great many are threshed out of the pods and lost. The Thomas Side Delivery Bean Rake is especially geared for the handling of beans. The cylinder moves much more slowly than it does in a hay rake.

Dixon & Griswold at No. 130 North Los Angeles Street have in stock the Thomas Side Delivery Rakes geared especially for beans and also have them in stock geared for hay. They are offering them at a special price of $100.00 each f. o. b. any railroad point in California or Arizona. Your dealer can easily get a Thomas for you at this special price. If there is no dealer in your section you can order a rake yourself by 'phone. The telephone number is 62852 Los Angeles.

COMBINATION
Orchard Cultivator, Furrower and Spring Tooth Harrow



Ranchers desiring an all round handy cultivator, furrower and spring tooth harrow will find this implement offers every desirable change and adjustment. It can be used as a 2 or 3 row furrowing out implement—as a nine tooth, spring tooth harrow, or a nine standard cultivator. Extra extension shanks make it possible to cultivate six feet wide. Wheels are adjustable to width desired with extension axles. This cultivator is perfectly balanced and is made of high grade material throughout. Fore truck or pole equipped as desired. It is a pleasure to own and work with an implement like this.

Warr Implement Co. 110 No. Los Angeles St., Los Angeles

Manufacturers and distributors of Farm Implements, Headquarters for Stockton and Fosmir gang parts. If you cannot get repairs elsewhere come in or write us.

Built to an ideal and not to a price

The great quality limitation of the average pump is its price. Before the first casting is made its life usefulness is pre-determined by *price*.

Byron Jackson has become synonymous with quality because it has been the policy of this Company through the years to reverse this procedure.

Every pump, whether special or standard, is built to the ideals of quality, efficiency, dependability and economy. Then, and only then, is price computed.

HORSE SHOE CORDS

Why Do These Dealers Handle Horse Shoe Tires?

There's a Reason

If you will study the list you will find that in each location the dealer who sells Horse Shoe Tires is one of the most successful and representative dealers in the town.

These men stake their reputation and success on the goods they sell.

They know that Horse Shoe Tires give big mileage for the money invested. That they are built to stand the wear and tear and hard knocks of long, rough usage on all kinds of roads. It is a fact that they give the maximum of safety in wet weather.

And they know that once a man uses Horse Shoe Tires he comes back for more—

That's Why!

Horse Shoe Cords Outwear Two Ordinary Tires

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Practically every livery stable in California has been turned into a garage. Garages produce no manure. Many farms produce a lesser quantity than they did a few years ago. Hence a question which frequently arises, "How can we secure the greatest return for the small quantity we have?" is most pertinent. The illustration on the cover, photograph taken by A. D. Shamel, gives a hint.

* * *

In addition, there are other hints given on Page 279. These are also by Mr. Shamel and give the very latest in manure application. This method has been urged for some three or four years and fullest investigation has been made following application in deep furrows. These investigations have included questions asked directly of the soil and directly of the tree at harvest time.

* * *

The scales, with their accurate weights of different grades of fruit, have been used in reading the answer of the tree to the effects of the deep furrow method. Mr. Shamel's article will prove of value to the man who is studying his own orchard soil.

* * *

There are not sufficient manures that all of our orchardists may follow this method, but it is a hint of value.

* * *

One objection we see to this method is that the ordinary and efficient manure spreader may not be called into action in putting the supply of manure in one narrow furrow, but we think the moment our implement and machinery manufacturers are convinced that this method of manure application is here to stay they will meet the need, and the furrow will be made and the manure drilled into the furrow and the covering all done in one operation.

* * *

But for us who have not the available supply of manure, there is the cover crop, and Messrs. Bristol, Koethen, Reed and others are talking cover crops. Like manure, cover crops are not all-sufficient. There are even circumstances where they do not prove a success. Some of our contributors this week refer to this deficiency, but when all is said and done the cover crop brings to the orchardist reasonable assurance that he can keep his soil in good condition if he will use it in all circumstances where possible.

* * *

By the plowing under of a green manure or cover crop beneficial action is secured far quicker than with a stable manure. One close observer has declared that within three or four weeks a green manure crop is completely broken down and incorporated in the soil if properly turned under. However, there are other advantages with the slower decomposing stable manure which make it imperative that every ounce of it shall be conserved.

* * *

Another point with the green manure crop, or in this case we will call it a cover crop, is its value as a soil binder on steep hillsides or where there is danger of erosion. Mr. Bristol brings out this point very forcefully in referring to its value on his slope with a fall of 300 feet.

* * *

The first to take up the use of green manure crops were the orange and lemon growers, but they are far from being alone in their use now for deciduous orchardists and vineyardists have used them to the limit. The vineyardist finds some difficulty in getting his trays off the field and the vines shortened so as to permit of seeding, but more recently he has not waited for the pruning to remove the vines, but by broadcasting his seed over the unpruned vines has gotten in a winter growing crop which has given a fair tonnage to turn under by midwinter or early spring.

* * *

The walnut grower likewise finds some nuts holding on after he would like to have his seed in to take advantage of the warm fall sunshine, but he is doing his best and plowing under a fair crop every year.

* * *

Many growers have found it advisable to apply their commercial fertilizers through the green manure crop. The root acids of the growing crop quickly pick up and use the fertility carried in the commercial fertilizer, and, as noted above, a very few weeks is sufficient to return it to the soil in a condition more available for the tree roots.

FAIR AWARDS

Some of the history of California has been written at the state fair just closed and becomes a part of this week's Cultivator. It may be found in "Livestock the Big Feature at Sacramento." In this account is given a list of the prize winners, and as some of these prize winners at former state fairs have proven real history makers we feel perfectly safe in predicting that more history has been made at the recent state fair and that some of these beef or dairy cattle, draft horses, porkers or sheep will pass their names down as worthy history makers.

NEXT WEEK

Next week's California Cultivator will be thoroughly buggy, and with the bugs will be incorporated various and sundry mildews, moulds and rots. But, as for each poison there is "some sweet oblivious antidote," so for each bug or pest with which the farmer has to deal, we will endeavor to provide a cure or, better, a preventive. In other words, it will be a pest fighting issue, and pest fighting issues of the California Cultivator which have appeared every two or three years since 1909 have been classics in their particular line. In fact, we were told by one who has read carefully and practiced faithfully that the last pest fighting issue of the California Cultivator has been regularly at hand and as faithfully read as the Bible.

Anyway, it is going to be a good number and is the product of several months spare minutes work on the part of the Cultivator staff and many of the state's best experts in spraying, fumigation and other methods of pest control.

It will be a number worth filing.

DOING POLITICS

It has been claimed by many that since its inception the fight against the state highway commission has been one of pure (?) politics. If this claim needs corroboration it is easily secured at the present time. It is most astonishing that the two automobile clubs of the state should have lent themselves to this political campaign. It is causing delay in the construction of California's good roads; it is holding the state up in a most discreditable way; and, so far as can be seen by the layman, is accomplishing absolutely nothing for those engaged in the attack.

One proof of the animus of this fight is given by the San Francisco Chronicle in a recent editorial in which it holds the governor responsible for the so-called failure of the highway commission: "If, as reported, the governor is to be a candidate to succeed himself, it would seem to be politically unwise to antagonize every owner of an automobile in the state and every farmer who must use the highways to market his products." In other words, "Mr. Governor, you must be good and accept dictation or you will get yours at the next election."

As to "every owner of an automobile and every farmer who must use the highways" being in sympathy with this campaign, the Chronicle and others have several guesses coming. It is claimed that there are 87,000 members of the auto associations. It may be that estimate is decidedly liberal, but, admitting it, we may say that there is nothing on earth more certain than that approval of this fight by the club management is far from unanimous on the part of members. In addition, there are some 525,000, other than those 87,000, owners of automobiles in California, who have little patience with this campaign.

The United States bureau of public roads has given highest commendation to California's accomplishment in road building. The peculiar manner in which "facts that ain't so" are stated is shown by the following from the Los Angeles Times: "The assertion by the governor that the United States bureau's report 'clearly vindicated our highway officials' can deceive only those who have not read the federal report."

Here are three sentences—quoted exactly — from that report of the bureau of public roads: "The work of the state highway commission and of the highway engineer shows a continuous and intelligent devotion to public duty. * * * The financial administration has been scrupulously honest and careful and the administrative and engineering costs have not been excessive, nor have final costs much exceeded the engineer's estimates. There should be no hesitation in going forward with confidence." These are only three sentences from a report covering several hundred pages and including a vast number of photographs and drawings. The report does not claim, nor does the highway commission claim that California's road building campaign covering several years and thousands of miles of construction is entirely without fault, but the twisting of truth to the injury of our state is certainly to be regretted.

The Cultivator has no taste for politics, but in this matter where the state's best interests are so lightly regarded, it is time for more of us "to speak up in meeting."

THE CONTEST

We have had occasion to criticize the movies. They have failed woefully in reaching their possibilities as an educational feature, but the other day we heard of one which is instructive and even inspirational. It depicted the contest between Carelessness, a skeleton figure gowned in black, with blazing torch in hand, and Thoughtfulness, a woman in white, holding the two-edged sword of education. The mission of Carelessness was to destroy, and many a group of little kiddies was surrounded with combustibles placed ready for the occasion by Carelessness, but when about to complete his destruction by the use of his torch he was driven away by Thoughfulness with her sword, and with it she directed the children to act for their own protection.

There is a mission in California right now for Thoughtfulness to go up and down the land with her educational sword. We note in the headlines "Fierce Brush Blaze Ruins Watershed"; "Fire Caused by Caretaker, Who Was Burning Weeds"; "Burning Mountain Is Thrilling Sight"; "Fills Gas Tank While Smoking Cigarette—May Live." This last accident was caused by a young man of 21, certainly old enough to have had better judgment, but a man of that type will never be very thoroughly impressed by the sword which Thoughtfulness is wielding—and there are others.

The destruction of California watersheds means much to the fruit growers of today, and more to the fruit growers of tomorrow. We are the guardians of this heritage. Let us enter the mountains on our camping trips and pass through fields dried by August and September sun as in a holy place.

A bit of carelessness on the part of Mother O'Leary's cow accomplished a loss aggregating some $190,000,000, probably the biggest single loss for a bit of carelessness. San Francisco's 1906 loss was greater but perhaps not quite so directly traceable to carelessness as was the incident of the overturned lantern. However, had that earthquake been preceded by a march through the city of Thoughtfulness with her Sword of Education, it might be that some of that $250,000,000 loss might have been prevented by more careful construction and better fighting equipment.

It is nearly a month to October 9, and October 9 is set aside as Fire Prevention Day. In that 30 days this country will have lost $30,000,000 because of conflagrations, largely the result of carelessness. We do not say this as a prophet, we simply are referring to the fact that the country's average fire loss during the past 365 days has been an even million of dollars every day.

As Josh Billings used to say, "It's two mutch."

California Cultivator

Vol. LVII, No. 12 | Los Angeles, September 17, 1921 | One Dollar Yearly

Furrow Manure Distribution in Citrus Orchards

By A. D. Shamel

THE autumn season for the application of stable manure, alfalfa hay and bean straw to citrus orchard soils is at hand. While some growers begin this work in September, most of those with whom the writer is familiar carry on this work during October, November, or early December. The writer does not believe that any particular month or period can be designated as the one best adapted for the fall application of manures in citrus orchards for all conditions in California. It will depend upon local circumstances, including the availability of the manures, cover crop conditions, climatic conditions and cultural factors.

The writer has begun to receive further inquiries from citrus growers as to the method of application of the manures in furrows. For this reason it is thought that a brief description of the furrow-manure method and recent observations on the results of the use of this system of applying manures to citrus orchard soils may be of interest. An attempt will be made to answer some of the questions most frequently asked in this connection.

The furrow-manure method may be defined as one whereby stable manure, alfalfa hay, bean straw or other similar organic fertilizers are applied in furrows alongside or between rows of citrus trees after which it is promptly covered by plowing or dragging the soil back over the manure which was thrown up in the process of making the furrows.

Arrangement of Furrows

The location of the furrows depends so much upon local conditions that no general statement covering all cases can be made. Wherever possible, and particularly in the case of young trees, the furrows for the first application should run parallel to the tree rows in the direction of the irrigation flow and be placed near the drip of the tree branches between or alongside the irrigation furrows. Experience shows that the manure furrows should not be placed directly under irrigation furrows if it is possible to avoid it. The furrows for the second application should be arranged in the same relative position to the trees but at right angles to those of the first treatment. In other words, the furrows for the year following the first application should run crosswise the first ones. In this way the trees will have had manure applied on all four sides within two years. The third season the furrows can be run in or near the middle of the tree rows, particularly in the case of large trees and in the same direction as those of the first application. The fourth year the furrows can be placed similarly to those of the third year but arranged at right angles to them or crosswise of the irrigation flow. Various modifications of this arrangement have been used by growers during the past seven years in the orchards under the writer's observation. In some cases the furrows have been run in or near the same position year after year. In other instances the furrows have been placed gradually nearer to the middles of the tree rows from year to year always in the direction of the irrigation flow. No definite evidence is available to show that one of these arrangements is markedly better than the other. Each has its advocates. The local conditions, such as lay of the land and spacing of the trees in each orcard, will have to be taken into consideration in order for the individual grower to decide definitely as to the best arrangement of the furrows.

Deep Furrow Application of Manure
Upper: Making manure furrow in lemon orchard in the Alta Loma district.
Center: Covering the manure in the furrow with a one horse breaking plow.
Lower: The finished manure furrow. The furrows on either side are used for irrigation.

Depth of Furrows

The depth of the furrow which has generally proven to be best under practical orchard conditions is about eight inches. The ideal to be attained is to make the furrows of such depth so that when the manures become settled in place the feeding roots which will develop and fill this area after the manure has become decomposed will not be disturbed during cultivation. At this depth, that is below the active cultivation zone, the decomposed manure and accompanying feeding roots will likely remain moist and in good condition between irrigations.

Kind of Furrows

The kind of a furrow is as fully, if not more, important than the depth. There are several furrowing plows, modifications of the middle buster type, in the market which are admirably adapted to this purpose. In addition to these several orchardists with whom the writer is acquainted have constructed home made furrowing plows out of ordinary subsoil plows, pieces of well casing and other pieces of steel. The ideal furrow should be wide and as clean as possible so that it will hold the stable manure, chopped alfalfa or bean straw, or other similar fertilizer in good shape.

Application of Manure

The distribution of the manures in the furrows is usually done by hand. One or two mechanical devices for distributing directly from the wagon or speader to the furrows have been tried experimentally. It is to be hoped that some such device will be manufactured on a commercial scale because such an arrangement will simplify and improve the work of distribution.

Alfalfa hay and bean straw are now being chopped or cut up into small pieces or chunks so that it can be more readily distributed in the furrows than is ordinarily the case. The writer believes that this will render it much more conveniently and easily distributed in the furrows than has been the case heretofore.

Amount of Manure

The amount of stable manure, alfalfa hay or bean straw for application will depend upon the age, size, bearing condition of the trees, the condition of the soil and other circumstances. As a rule five cubic feet of good stable manure or its equivalent in alfalfa hay or bean straw per tree has given good results. As much as 20 cubic feet of stable manure per tree has been applied in some instances under the writer's observation with very markedly beneficial results. Whether or not this large application has been economically profitable the writer is unable to say except that one grower who has used this amount has assured the writer that in his case it has been very profitable. The writer has found no reason to change his opinion expressed several years ago following a study of the results of the use of the furrow-manure method that the use of five cubic feet of stable manure per tree in furrows gives superior results to the application of 10 cubic feet per tree under the ordinary broadcast method. Recent experiences and observations have confirmed this statement beyond a question of doubt in the mind of the writer.

Covering Filled Furrows

In covering the manure in the furrows several different methods are in use. The usual one is to plow the loose soil from the manure furrow back over the manure. The two furrows made during the process are subsequently used for irrigation. Where the furrows are placed close to the trees, this covering is frequently done with one horse pulling a small moldboard or breaking plow. A V-shaped drag is often used, the sides of the drag pulling the loose soil back over the manure. Disk and other forms of ridging cultivators are also used for this purpose.

Cost of Furrow Manuring

The cost of applying the manure in furrows is no greater, if as much, than where the manure is broadcasted and plowed under. In most cases under observation, the cost has been decidedly less than under the broadcast system. Frank F. Crane of the National Orange Company has recently informed the writer, that the cost of chopping alfalfa hay for about 500 acres of citrus orchards in 1920 was $2.25 per ton. The analyses of the alfalfa showed better than two per cent of nitrogen. This nitrogen content of the stable manure used in National Orange Company's orchards was less than six-tenths of one per cent based upon the shipping weight.

Mr. Chase further states that the chopped alfalfa hay was applied during 1920 at the rate of about three tons per acre. During the present season a somewhat larger application is contemplated. Most of the hay was broadcasted but some of it was applied in furrows. There was not much difference in the cost of the two systems of application.

Broadcasting the Manures

It seems logical and there is some evidence to support the contention that the stable manure, alfalfa hay or bean straw should be broadcasted at certain intervals in order to improve the soil condition over the entire orchard area. The length of intervals between the broadcast applications depends so much upon local conditions that the writer does not feel able to offer any definite suggestion on this point. It seems likely that where it is thought that such applications are necessary they should be made at least every fifth or sixth year. Some growers make such an occasional broadcast application between the regular periods for the use of the furrow-manure method with apparently good results. In these cases the furrow-manure treatment is ap-

(Continued on Page 287.)

Agricultural News Notes of the Pacific Coast

Northern California

Excellent quality of broom corn is being raised at Colusa.

A large acreage of rice in Yuba County is ready for harvest.

Trinity County is to hold its first county fair September 20-22 at Weaverville.

Agricultural courses will be largely featured in the curriculum of the Oroville union high school.

Dunsmuir, Siskiyou County, had its first heavy shower of the season the second day of September.

In the national forest reserves of California officials report that 645 fires have been fought this season.

The Poultry Producers of central California are making regular shipments by way of Panama to New York.

Olive growers at Fair Oaks, Sacramento County, have set $100 a ton as the price for pickle olives and $20 a ton for picking.

The Redding Chamber of Commerce has named committees to investigate the proposition of building scenic highways in Lassen national park.

The Sutter County Farm Bureau Exchange recently received an order for three carloads of Holsteins, two cars to go to Nevada and one to San Joaquin Valley.

The hop crop of the Sacramento Valley is lighter than indicated by early estimates. Hop men think it will be 30 to 40 per cent less than last year's crop.

The Auburn-Reno Highway Association has been formed to work for construction of a state highway along the Truckee River rather than the Dog Valley route.

Glenn County fair opens September 19 for six days. A large new tent has been erected so that stock judging may be held under cover. The fair will be held at Orland.

The Siskiyou County Pomona Grange met at Sisson for its August meeting and plans were made for the state convention which will be held in that county in October.

Winners in the boys' calf club contest were announced at Durham, Butte County, last week. The first prize was won by Leslie Rodney, second by John Horn, third by Andrew Brandt.

The California Fruit Exchange has bought from the Western Pacific several tracts of timber land on the Feather River to use in box making. The Exchange has a sawmill at Blairsden, Plumas County.

A carload of Sutter Basin Duroc-Jerseys recently sold on the San Francisco market at 12½ cents a pound which was 1 cent above market price for that day. There were 68 head in the carload averaging 200 pounds.

Contracts have been let by the state reclamation board for work on the levee on the east bank of the Sacramento at Hood. A concrete highway will be built on the levee, closing the gap between Freeport and Courtland.

Cattlemen have for years leased from the government range on the Trinity-Siskiyou divide. Recent surveys have established Southern Pacific title to this land and cattlemen are much chagrined at finding that sheepmen have already arranged to lease the range and have turned in their sheep.

Central California

Terra Bella irrigation district has added another big well to its supply.

The English market is developing a strong demand for Thompson Seedless raisins.

Stanislaus County grape growers are being paid $65 for most varieties of black grapes.

Waterford, Sanislaus County, is making plans for its fall festival and community fair.

The daily weather forcast service was resumed in the San Joaquin Valley September 1.

The Madera County chamber of commerce is planning an annual fig day for Madera County.

Nurserymen have been visiting bulb farms in the Salinas Valley to make purchases for the coming season.

The peach and fig growers are canning on an average of two tons of figs per day at their new Turlock cannery.

Colonists at Delhi, Merced County, are much interested in activities of oil companies who are surveying the lands.

Cantaloupe growers at Gilman, Stanislaus County, say that the close of the season has left them with a fair profit.

Several shipments of feeder cattle have been brought in from Arizona for the ranges near Livingston, Merced County.

Turlock melon growers are up against a closed market in the East. Many carlot shipments have sold for freight charges.

Hog auctions will be held by the Farm Bureau Marketing Association at Bakersfield, September 17; McFarland, 30; Wasco, October 1.

Kern County farm center meetings: Mountain View, 19; Pond, 21; Inyo-Kern, 22; Rosedale, 23; Shafter, 28; Arvin, 30; board of directors, October 1.

Kern County farm bureau picnic was held September 13 at Switzers Grove. Two steers were donated for the barbecue by H. A. Jastro and E. E. Rankin.

A Claus rancher carried a load of string beans to Stockton, was offered one cent a pound for the lot and brought them home and fed them to his hogs.

The California Dairy Council is planning to hold a dairy products show some time in November at Stockton. It will be called the Pacific Slope Dairy Products Show.

A petition is being circulated among the orchardists of Tulare County asking that the services of P. A. Boncquet be retained as county plant pathologist.

A fair was held by the Hilmar and Irwin districts of Stanislaus County at the Hilmar high school on September 1, exhibits covering every farm, home and school activity.

Farm home department meetings in Kern County: County committee meeting, 17; Weed Patch, 20; Inyo-Kern, 22; Kern-Delta, 27; Beardsley, 28; Wasco, 29; Edison-Fairfax, 30.

The four creameries operating in Tulare city paid to dairymen for butterfat and whole milk during the month of July $214,000. 45 cents was paid for butterfat, an advance of 10 cents over the June price.

Southern California

Five carloads of hogs were shipped from Brawley, September 5.

Bean threshing is on in the Oxnard district of Ventura County.

Ventura County fair opens October 5. It will be held for four days.

B. D. Irvine of Brawley reports big demand for feeders and stock hogs.

Palo Verde cotton growers are encouraged at better market prospects.

Fifty-seven fumigating outfits are busy in the orchards of Orange County.

The Taxpayers League of Ventura County is calling for a cutting down of next year's budget.

There was a large attendance at the Walnut Growers field day, held at Puente, September 16.

Imperial County farm bureau is organizing the marketing exchange to be directed by Mike Liebert.

Manager Churchill of the California Lima Bean Growers Association reports all Baby Limas sold out.

The California Association of Dairy and Meat Inspectors will meet at Santa Monica, September 27-30.

Imperial Valley farmers are already busy getting their barley, lettuce, pea and tomato lands ready for fall planting.

The state highway commission says that the Banning-Indio link of the state highway will be constructed at once.

Beans and walnuts are being harvested in the Carpinteria Valley of Santa Barbara County. A normal crop of walnuts is indicated.

A petition is being circulated in Ventura County asking the supervisors to abolish the office of bee inspector as they consider it a needless expense.

It is proposed to form an irrigation district to take in 25,000 acres on the old Conejo Ranch in Ventura County. There is also talk of forming another irrigation district taking in most of the Simi Valley.

The Oxnard Lima Bean Growers Association has elected A. L. Gordon, president; Bernard Schmitz, secretary-treasurer. W. S. Saviers will represent the association on the central board of the state association.

State Quarantine Officer Strong is advising those who wish to import resistant grapevines from foreign countries to make immediate application to the federal horticultural board at Washington so that they will receive them in time for planting.

A walnut growers field day was held at Puente September 16 under the auspices of the Los Angeles County farm bureau. President Teague reported on the tariff fight at Washington and Manager Thorpe on the year's work of the association.

Manager Churchill of the California Lima Bean Growers Association says that the improvement in the cotton market will improve business in the Southern states and consequently increase demand for California beans as that section is a large consumer.

U. S. bureau of crop estimates figures show that California is by far the largest producer of beans of any state in the Union. The estimated production for the coming year is 2,398,000 sacks. Michigan, the next big bean state, is expected to produce 1,498,000.

The Coast and General

The Oregon State Motor Association is erecting road signs all over the state.

Japanese mills import largely of cotton from India as well as the United States.

Alfalfa in the Yuma section of Arizona is making fine growth towards second setting of seed.

Hop picking began at Salem, Oregon, August 20. The pickers are paid 50 cents per 50 pound box.

The hop harvest has begun in the Yakima Valley of Washington, providing work for 2000 hands.

Alfalfa growers near Klamath Falls, Oregon, are planning to build a cooperative alfalfa meal mill.

The Oregon Jersey Cattle Club is planning for an exhibit at the National Dairy Show this fall.

For the first time electric lamps manufactured in China appear on the export list to the United States.

The town of Wilbur, Washington, has a 33 acre hay field which last year brought the town an income of $2500.

The Yakima Valley of Washington this year shipped out 142 carloads of cherries, mostly Bings and Lamberts.

Census reports show that the state of Washington has 18,560 pure bred cattle. Of these 7637 are Holsteins, 3381 Shorthorns.

The weather bureau reports that the recent heavy rains on Arizona ranges have already made possible shipment of fat range cattle.

Over 65,000 pounds of poison was distributed among Oregon farmers to use in fighting rodents the first six months of the year.

The newly organized Skagit, Washington, Dairymen's Association is receiving 40,000 pounds of milk a day at its Burlington plant.

A new feature of the Washington state fair to be held at Yakima this fall is a dog show. Two hundred entries have already been made.

The Skagit County fair held at Burlington, Washington, August 8-13, had record breaking attendance and was financially profitable as well.

County Commissioners of Walla Walla, Washington, are being petitioned by farm bureau women to appoint a home demonstration leader.

An agricultural and veterinary college has been established by the state of Minas Geraes, Brazil. Dr. Peter Rolfe of Florida has been appointed first director.

Orange growers and shippers of Jaffa are urging the government of Palestime to improve that port and Haifa and to build a railroad from the sea of Galilee east to connect with the Bagdad railway.

The department of immigration and colonization at Ottawa, Canada, reports rapid development in irrigation in the section about Lethbridge, Alberta. Construction now under way will provide irrigation for 500,000 acres.

A trial public market at Klamath Falls, Oregon, has proved so satisfactory that permanent stalls and storeroom will be built and later a warehouse and cold storage system. For the present the market will be open only one day a week.

Tractors and the State Fair Exhibit

By M. C. Holman

POWER on the farm means bigger crops and more money in the bank. The modern farmer requires power delivered from a unit plant in such quantity as to make it available either as a pulling force or as a stationary engine. Farming on a large or small scale is becoming an analyzed business enterprise where every expenditure, whether in money or labor, is measured in the balance with adequate return.

All modern farmers recognize the value of the tractor as the means of furnishing the needed farm power. They have long since been familiar with the facts of economy and reliability and on hundreds of farms in California the tractor does its daily jobs, delivering its power day and night.

There is no occasion at this time to argue the value of the tractor. That has been done, and easily, for the desirability of the tractor is so apparent that argument in favor of its use is but arguing along the line of no resistance. There is no reason to believe that the tractor is not here to stay. Its every day service and the ever increasing army of users proclaim adaptability for every division of farm work.

Have you a small ranch? Then purchase a small tractor. A big tractor would be a white elephant or a dead horse on your hands. But for heavy work with a large number of plows or for sub-soil work a small tractor would be quite as useless as a toy wagon to haul a monolith. Tractors are suited to certain kinds of work. They have their limitations and will deliver only the power that is built into them. If more horsepower is required than your tractor was built to deliver, then you are harnessing too great a load to your mechanical steed and it will balk.

Look about you. Where are the dozens of tractors of two years ago? They are not on the market. They are not manufactured. Tried in the field they failed and the factories making them went out of business. Some firms built one tractor and hauled it from fair to fair. There was no quantity production. There was no state wide distribution of parts. The operator could be held up for days awaiting the arrival of a replacement. It is not always necessary to purchase from a big firm, but care and judgment are always essential in buying a tractor. In contemplating a purchase, consider several tractors, discover their good points and learn their capabilities. Match them up with your requirements and pick out the one best suited to your needs.

At a tractor exhibit such as the one at the state fair one has an opportunity within a limited space to make minute comparisons. The 1921 exhibit was not so large as on some previous occasions when money was more plentiful and there was a greater willingness to spend it. But the exhibit was a pleasure to look at and a greater pleasure to study.

The big tent was comfortably filled and the exhibits were attractively arranged. The California Tractor and Implement Association put on an exhibit that was a credit to the tractor industry of the state. New features commanded strong and favorable comment. New tractors were given the once or twice over and explanations were abundant and thorough from the mechanical departments of each factory. Some special features were prominently emphasized.

The new Best 20-30 has all working parts completely housed. The motor is lubricated by a full force feed system. In place of the old rubber radiator connections this new tractor has steel tube connections. With the exception of the engine all bearings are full anti-friction type.

The Holt 14-25, a new member of the Holt family, carries a motor that was developed by Pliny Holt, designer of government gun mounts. It is the overhead valve type, so much used in auto building. Its combustion chambers are machined to absolute smoothness, in place of being simply cast and left rough. The chambers are dome shape, reflecting the fuel gas directly to the pistons. All belts are eliminated by the use of gears.

Simplicity marks the action of the new 9-16 Cletrac. It has but one oil chamber. Oil the motor and the tractor is oiled. The main drive shaft is full floating and the rollers run on a double pair of roller bearings. All parts are accessible.

The wheel type Gladiator is a new one on the market. It is 12-20 horsepower and carries its plows attached to the frame directly under the seat. They are raised and lowered by means of an hydraulic control. Standard roller bearings are used throughout. A Widely four cylinder motor is mounted on a heavy steel frame and oil is supplied by means of a force feed system. Kingston high tension magneto and Kingston carburetor are used. The tractor, with plows attached, will turn inside of a nine foot circle.

The new Yuba model 25-40 has the two clutch transmission system which enables it to be turned as swiftly and easily as a row boat. The clutches are independent of each other and reversible. The Yuba is suited to side hill work and will do sand jobs as well as hard surfaces. The transmission is in an air tight, dust proof semi-steel case and runs in an oil bath. This tractor has a maximum sustained draw bar pull of 6,000 pounds. At low gear it travels 2.06 miles per hour, and at high gear it makes 3.28 miles per hour.

The Wizard 4-pull tractor is scheduled to be ready for delivery from its mammoth concrete factory at Stockton about November 1. In this tractor power is delivered to all four wheels and the entire mechanism is protected from dust and dirt by being completely enclosed. A very unique steering device, as easily operated as your auto, gives the driver complete control of the machine. This tractor is a combination of science, invention and experience. It has the Kroyer 40 horsepower motor with a draw bar rating of 20 horsepower normal and a belt pulley rating of 35 horsepower. The forward speeds are two and one-half and four miles per hour, with a reverse speed of two miles per hour. The Wizard has performed some clever stunts and its practical use bids fair to prove it a wonderful tractor.

Many of the old line tractors were not on hand. As the old ones have dropped out others have come to take their places and attract buyers, which should mean every farmer in California.

An adjunct to the tractor exhibit was the tent occupied by the University of California and used as a demonstration and lecture room. Professor L. F. Fletcher, assisted by a corps of instructors, gave valuable talks and demonstrations in the proper care and handling of tractors. Their lectures covered everything about a tractor from the tracklayer plater and wheels to the delicate mechanism of the carburetor. The interested crowds that attended these lectures is evidence of the high esteem in which the work is held by owners and operators.

In speaking of this work Professor Fletcher said: "The tractor operator should know more about his machine. We find that much loss and unsatisfactory work results from a lack of familiarity with the working parts of the tractor. It is our endeavor to bring home to the user such information as will enable him to get the most out of his machine."

The lectures embraced complete instruction in valve grinding, fitting of bearings, adjusting piston rings, ignition troubles and how to remedy them, handling low grade oil, troubles with the magneto, troubles with the carburetor, cooling system, etc.

The tractor exhibit was a huge success. Many tractors were sold, more will be sold as a result of it and bigger crops will be raised on California farms.

Livestock the Big Feature at Sacramento

By R. P. Royce

CALIFORNIA is a great livestock state. That fact was definitely established at the state fair at Sacramento last week when by odds the best balanced livestock exhibition ever staged in California was held. The showing in nearly every class was indeed remarkable and when contrasted with the shows of a few years back furnished convincing proof of the progress this state has been making. The 1921 fair, great as it was, can be taken as just a hint of what may be expected in the years to come.

In every department the outstanding feature was the marked quality of the individual exhibits. There were mighty few tag ends and the tops were of a quality to bring forth frank admiration from the judges and the spectators. The most encouraging feature of the livestock show, and the one most often commented on, was the interest manifested by the visitors. Men long familiar with California fairs declared that more people watched the judging this year than ever before, a fact that can be taken to indicate the interest California farmers and ranchers are giving the problem of better livestock. And just here is a good time to remark that a lot more people would have watched the various classes judged if it had been possible for them to have found seats. There is no more pressing problem confronting the state fair management than proper accommodations for judging. This need can and must be met by a large pavilion wherein many of the classes can be rated and the interested public can follow the placing of awards with some degree of comfort. The California state fair has reached such proportions that steps must be taken to provide a pavilion in keeping with the needs and the character of the fair. The plan of judging classes in small tents scattered here and there on the grounds is probably the best arrangement under present circumstances but is no credit to the state and falls far short of being adequate. Many classes this year were so large that great difficulty was experienced in getting them into the ring, and it can be certain that the future growth of the fair will be measured by the accommodations provided.

Another serious problem that confronts the fair management and the exhibitors is the matter of increased prizes and prize money. During the past few years while the livestock industry has been developing so fast, very little increase has been made either in the amount of prize money or the number of places drawing a rating. A classification based on three or four premiums to a class is no inducement for a large number of breeders to participate. Showing is an expense to most exhibitors at best and if the fair is to continue to register growth from year to year some plan must be developed whereby there is wider opportunity for exhibitors to reap some reward. In several classes this year the superintendent made public apology over the inability of the fair board to make awards to animals left out of the money—animals that a few years back would have easily led their classes.

The outstanding feature of the show just closed was the exhibit of beef cattle. Never before in any California show has such an exhibit been made. Few of the large Eastern shows will have more Herefords and Shorthorns and mighty few will have better tops than were seen at Sacramento. This year's show is the first real reflection of the expansion that has been going on in beef circles during the past few years during which time some of the best blood and individuals of the different breeds has found its way to California.

(Continued on Page 296.)

State Convention

By C. B. Messenger

PLANS are making for a great event at the assembly room in Exposition Park, Los Angeles, October 24-26. It is the fifty-fourth of these state conventions held originally under the auspices of the state board of horticulture, later of the state horticultural commissioner and now under the direction of the state department of agriculture. Director Hecke, Chief Deputy Killingsworth, Chief Quarantine Officer Strong and others of the state department were in Los Angeles on Monday to confer with fruit growers and business men of the city as to the program and some of the details of the convention.

It was decided to give to legislation the entire first day of the convention, in the forenoon the addresses and discussions to be led by Secretary Wilson and President Teague of the legislative committee created at the convention held in Chico nearly two years ago, these discussions to have to do with legislation accomplished and legislation needed by the farmers of California, the afternoon to be given to cooperation in the large. The point was made at the preliminary meeting that many cooperative movements had been started and had succeeded for a time, but because of lack of fullest understanding of constitutional rights and of national enactments had either gone on the rocks or been confronted by serious difficulties. There are several attorneys in the state who have made intensive study of these larger legal aspects affecting cooperative movements. One of these, George B. Farrand, has been attorney for the California Fruit Growers Exchange, the Walnut Growers and other cooperative bodies. Mr. Aaron Sapiro of San Francisco has also made thorough investigation of cooperative movements. Another is Judge Morrison of Los Angeles, attorney for alfalfa growers, poultry and other cooperative associations. It is also hoped that Senator M. B. Harris of San Diego will be able to enter into this discussion to be held the afternoon of the first day.

The entire session, both forenoon and afternoon, of the second day of the convention will presumably be given up to discussion of transportation—water transportation, railway, and possibly gasoline. It is hoped that President Lasker or Meyer Lissner of the federal shipping board may be present. An address will be given by Mr. Whitcomb of the exchange, who has made an intensive study of water transportation problems during the past year; also by Walter S. McPherson, who is connected with the Hawaiian Steamship Company.

The evening of the second day is to be the social and feast of reason event. It is hoped Secretary of Agriculture Wallace or Herbert Hoover may arrange contemplated Western trip so as to be present at this time. Secretary Wallace has already been approached in this matter and has not given a positive refusal. Another of great oratorical ability, and one who has grasp of the larger food problems of the world, is Prof. Alonzo Taylor of Stanford University.

The third day, and possibly an evening session, will be in charge of horticultural commissioners and representatives of the state farm bureau. A special committee has been appointed for this, and a full day is promised with speakers of note.

It is to be noted that the cultural side of California farming has been almost entirely ignored, in fact, the director remarked in calling the volunteer committee to order that cultural problems are now so thoroughly discussed at farm bureau centers, at institutes, and even at meetings of horticultural commissioners, that he felt it entirely wise to break away from the methods followed by some former conventions and give attention at all the sessions to the larger questions affecting the entire body of producers.

The state convention of California nurserymen will have ended the Saturday preceding this convention, but the horticultural fair or show which is being staged by the Nurserymen's Association will be open for the entire week of the fruit growers convention. It is probable that the state association of horticultural commissioners will be attended by all the county commissioners of the state.

WHAT ABOUT THAT COVER CROP?

By Fred M. Reed

AT this time of year many ranchers in the citrus belt are trying to make up their minds on the cover crop problem, with a view to deciding whether to plant or not to plant. After all these years of practical trials and technical experiments, the problem is as much "in the air" as ever, along with a lot of other orchard practices that have never been standardized for all localities and types of soil.

The best anyone can do in the matter is to weigh the evidence for and against the cover crop in the light of actual experience under each local set of circumstances and decide on that basis.

In our locality (Riverside) the cover crop is used on about 30 per cent of the citrus acreage, and this proportion does not vary greatly from year to year, although the same growers do not maintain the practice regularly, while others occasionally plant a cover crop "on suspicion," and if they don't get a remarkable increase in the next citrus crop they discard the practice in disgust.

Those growers who consistently keep up the cover crop practice claim that they get a more satisfactory soil condition, that the ground takes and holds water better, that during the time the crop is growing there is a considerable saving of cultivation expense, and many claim that they are able to safely cut down the amount of commercial fertilizers necessary to produce a satisfactory crop. A few cases are reported, usually by salesmen for seed houses and bacteria culture producers, where no other fertilizer is used, but the writer has never seen such results himself.

On the other hand, the growers who reject the cover crop practice claim that there is no appreciable saving in fertilizer expense, that the cover cropped groves are apt to be colder in frosty weather than the clean cultivated ones, that in wet weather there is more damage to the fruit by fungus troubles, and finally that there is no proof that the cover crop as usually grown is of any benefit to a citrus grove either in quantity or quality of fruit or condition of trees and soil.

Inasmuch as good, bad and indifferent examples of the cover crop practice exist in every locality that the writer has so far observed, he maintains that it is up to each grower to use his own best judgment.

Theoretically and scientifically, the advantages are certainly on the side of the cover crop, while on the practical side many successful growers seem to get perfectly satisfactory results without the help of the festive legume and its alleged nitrogen gathering bacteria.

A few growers in our locality who have extra water are using cow peas or beans as a summer cover crop, and the young orchard of the citrus experiment station is a very fine testimonial to the practice.

The melilotus seed now on the market is reasonable in price and has a high proportion of viability, so that no one need to plant with any doubt of getting a stand, and there are almost as many methods of planting as there are planters, but with us the most consistently best results seem to follow broadcast sowing, before an irrigation in September or October, and sowing part of the seed before and part after the furrows are drawn.

CALIFORNIA FLOWER SHOW AND HORTICULTURAL EXHIBITION

The nurseymen and horticulturalists are working to make the forthcoming show at Exposition Park, Los Angeles, October 20-26, not only a beautiful but an instructive exhibition. It will not be a dahlia show, a rose show, a chrysanthemum show, but it will be a complete show in all seasonal flowers. One but needs to visit Exposition Park to ascertain the scope of the exposition. The sunken gardens are fast rounding into shape. A description will not reveal the wonderful coloring, the kaleidoscopic arrangement of some of the rarest and most beautiful flowers, and there are seven acres of it—of beauty.

A mammoth tent will house the cut flowers and floral features. The Pasadena Horticultural Society has announced that practically 3,500 feet of space will be required by members. Thousands of feet of space have been taken by exhibitors from San Francisco, Eureka, San Jose, Sacramento, Santa Barbara and communities near Los Angeles.

Arrangements are being made for suitable ceremonies to open the show and for many entertainment features. Exposition officials expect an attendance of at least 150,000. Thousands of winter visitors will be in Los Angeles and with four big horticultural and fruit conventions here during the show, its success seems assured. The technical ideas that will be incorporated will be decidedly beneficial to every member of the industry. Demonstrations and lectures given daily at sessions of the California Association of Nurserymen, whose convention is scheduled during the show, will prove very helpful

"The nursery that helped to make Santa Clara Valley Famous."

THE CHEAPEST PLACE TO BUY GOOD FRUIT TREES

Inferior nursery stock at any price is too costly. Good trees at prices that are too high is extravagance. But when you can buy the very highest grade of trees—clean, healthy, vigorous stock, budded from trees of known productiveness—at our low prices, then you are making a wise investment.

Ask For Our Special "Early Order" Offer

It's the fairest offer ever made by a nursery house. And when you consider that back of the offer is a concern with thirty-two years of experience and fair dealing, the offer becomes doubly attractive. This special "Early Order" offer covers all standard varieties, including:

Prune	Pear	Peach	Apricot	Nectarine
Fig	Plum	Grapes	Berries	All Small Fruits
Quince	Olive	Orange	Lemon	Lime

ALSO—WE SPECIALIZE ON NUT TREES, particularly the famous Payne Seedling, the most profitable commercial walnut on the market today. Tell us how many trees you want, state the variety, and get our quotation, together with the special "Early Order" offer.

ELMER BROS. NURSERY

Established in 1892

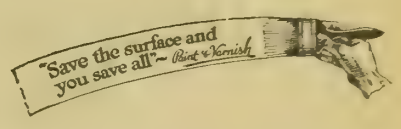
How It Pays

To Use the Best Paint on the Farm



IT costs more to rot a house or barn than to paint it right. Depreciation costs more than good paint.

The best paint is the best protection, and it is protection that you're seeking. You can't protect your house with *color only*. You must use *good* paint—the kind of paint that *saves the surface*.

The best paint protects the wood, keeps heat, moisture and rain from creeping in and rotting it. It's the only inexpensive paint.

Such paint spreads easier—saves labor. And covers more per gallon. Figuring the lesser cost of application and the greater covering capacity, your best paint is actually *less costly on the house or barn* than cheap paint. Don't allow surfaces to rot. It costs less to paint them.

Paint with such paint regularly and your buildings are as good years hence as now. If you should sell you'd get an extra price several times your entire investment in good paint.

Fuller's Specification Farm Paints are the finest, therefore the "least expensive" we can make after 72 years' experience in the manufacture of paints for western use, where conditions are so different than elsewhere. Let Fuller specify for you and paint will never cost you anything because of what that paint will *save*.

Ask Us For
Free Advice

WE maintain a special department to give advice on painting to anyone who wants it. Its services are free to you.

We tell how to treat the old paint, what color scheme to use, how many coats, the type of brush you need, the best time to paint, etc.

Use Fuller Service as well as Fuller paints.

Free Book
Send Coupon

Mail the coupon for free book, "Save the Surface," which tells why good paint is important.

We'll also send a small catalog of Fuller's Specification Paints and Varnishes for the farm.

Send coupon now. It's well to know the reasons for good paint.

Fuller's
SPECIFICATION
Farm Paints

House Paint - Barn & Roof Paint
Wagon Paint - Rubber Cement Floor Paint

M'f'd by W. P. FULLER & CO., San Francisco

HOUSE PAINT: Fuller's Pure Prepared Paint, Phoenix Pure Paint, for Painting Houses. The purest, best protective and most durable paint made. Made in 32 colors.

BARN AND ROOF PAINT: A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality. Six colors to select from.

FLOOR PAINT: Fuller's Rubber-Cement Floor paint — sanitary, waterproof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard overnight. Made in 12 colors.

IMPLEMENT PAINT: Fuller's Pacific Wagon paint adapted for repainting agricultural implements, farm wagons, windmills and farm machinery. A glossy, durable finish offered in 7 colors.

Pioneer Manufacturers of Paints, Varnishes, Enamels, Stains and PIONEER WHITE LEAD for 72 Years

Established 1849 Branches in 16 Cities in the West—Dealers Everywhere

For all exterior jobs of painting it is advisable to obtain the services of a Master Painter

W. P. Fuller & Co.
Dept. F-34 San Francisco.

Please send me, without charge, a copy of "Save the Surface" and your small booklet of farm paints and varnishes.

NOTICE

To Fruit Growers

WE have just purchased the Placer County Nurseries located near Loomis, comprising some 320 acres, devoted exclusively to the growing of fruit bearing trees. We will hereafter personally conduct this Nursery in conjunction with the one at Niles.

We probably have the most complete stock of deciduous and evergreen ornamentals, fruit bearing trees, roses, vines, etc., in the state.

Again the Cover Crop

By William M. Bristol

WITH no intention of being irreverent, the orange growers of Southern California have nullified the Scriptural maxim that "Whatsoever a man soweth that shall he also reap," for year after year they plant all manner of crops between their trees—and then plow them under.

A note from the editor of the Cultivator asks for a short article on "cover crops, shade crops, green manure crops, or whatever we choose to call them." Intentionally or unintentionally he thereby calls for a vote on the choice of a definite term for these crops. Personally I prefer the term "cover crop," for, if the editor will pardon the big words, the alliteration is euphonious, and the phrase is broad enough to include all the various crops of this character, for whatever purpose they may be planted. When the question of purpose comes up there is time to go into further detail.

Asking a man to write on the cover crop question, however, is inviting him to take part in a game of guessing. Since the planting of these crops in the citrus orchards of California was begun the growers have said "Hello" and "Goodbye" to a vast throng of candidates for their favor. "What I know about so and so" is a popular way of heading a story. But in writing on the cover crop subject I feel like saying, "What I think I know," for every year or two I have to unlearn nearly everything and start over again.

A Kentucky colonel once said to a man: "My dear fellow, don't speak of any whisky as 'bad'; if you must make comparisons, say that some whiskies are better than others." I am a firm believer in cover crops and have tried, successively, Canadian peas, vetch, lupines and Melilotus Indica for winter, and alfalfa, cow peas and Melilotus alba for summer. I am firmly convinced that all are good but that some are better than others, the question of preference turning upon the character of soil and the particular purpose for which the crop is planted.

At the date of writing this (September 6) I have just finished turning under a magnificent crop of Whippoorwill cow-peas, planted the first week in June. The job was done with three implements, an in-throw disk to knock them down and pull them away from the trees, an out-throw disk heavily weighted and set nearly straight, to chop them up, and a one horse plow to turn them under. Immediately after the plowing was finished the ground was harrowed twice, with the teeth set nearly flat, the purpose being to pack the moist earth on the vines so they would decay quickly and permit of making furrows for irrigation within a few weeks. The soil is a gravelly loam, and the disk implements went in immediately after the water was shut off after having run for 24 hours in the furrows made at the time of planting. One implement followed another so quickly that what was a plot of luxuriant pea vines in the morning was simply a plot of bare ground at night.

I grow summer cover crops for a number of reasons, and one of these reasons is as compelling as all the others combined. My orchard extends for more than half a mile up the rather steep slope of the East Highlands mesa, being nearly 300 feet higher at the top than at the bottom. Long ago I learned to my sorrow that at intervals of a few years a summer cloudburst drops down unexpectedly along the foothills; and two inches of rain within an hour can do untold damage on a long and steep slope where the soil is under clean cultivation. Once it took half a dozen teams a month to haul in enough soil to replace that washed away, and I saw that I must find some means of preventing a repetition of the disaster. "If brush on a mountainside prevents erosion it follows that vegetation growing in an orchard will perform the same service," I meditated; and the summer cover crop was my solution of the problem of guarding against the summer cloudburst. Since I began the practice there has been no opportunity to demonstrate the correctness of the logic, but I have not the slightest doubt about it. And apparently the summer cloudburst fears to try conclusions with my hillside with its broad bands of green cowpeas, for we have had no heavy summer rains since the peas went on guard. If the question is asked: "What protection have you between the downing of the summer crop and the growth of the winter crop," my answer is that during the 30 years I have lived here there has been no rain between August and December that could be called a cloudburst. Anticipating the further question: "If a summer cover crop in alternate lands is a good thing why wouldn't it be twice as good in every land," my answer is that as soon as I can get water enough and fertilizer enough I am going to try it. I pump all my water, the maximum lift being over 300 feet. My duplex plunger pump, equipped with wonderful new valves which eliminate all slippage, lifts 20 miners inches night and day continuously throughout the irrigating season, and I use it all on 40 acres of oranges. Alternate lands are irrigated each day and we get over the tract about once in three weeks, which means that each tree gets water on one side about once in ten days. I heartily agree with Messrs. Vaile and Surr that frequent irrigation is good for citrus trees.

I believe that a good crop of fruit and a good cover crop can be grown on the same piece of ground at the same time if there is abundant food and water for both. Certain it is that my trees have flourished so far under the alternate land system and I see no reason to turn backward. I have read with much interest the report of Messrs. Vaile and Surr on their experiments in the Tulare region and of their decision that growing alfalfa in alternate lands to provide organic matter for the other lands is not feasible. Many years ago I tried alfalfa, but discarded it for two reasons. In stating the first reason I am putting into words what I believe to be a fact, and one which I have not seen in print, namely, that it is not the growing of the cover crop that is beneficial to the soil, but rather its death and decay. It is true that the perforation of the hardened earth by the vigorous roots of alfalfa or melilotus alba affords opportunity for the penetration of irrigation water, but it is also true that there is no open hole there until the root which made it is dead and gone. For this reason a strong growing plant like the annual melilotus alba or Hubam clover is preferable to a perennial like alfalfa or even the bi-ennial melilotus alba. My second objection to alfalfa in an orchard is that it is almost impossible to get rid of it without resorting to the grub hoe.

As to the value of the summer cover crop in shading the ground to prevent the so-called June drop I am still skeptical. Even under favorable climatic conditions the orange tree seems, intuitively, to drop most of its crop unless there is abundant fertility available in the soil for its maturing. When the tree is putting out its blossom and fruit bearing shoots in the springtime it is also making below ground a corresponding growth of fine fibrous roots to support those shoots, as well as the blossoms and the fruits they are to carry. If these shoots were systematically destroyed and removed from the tree it is obvious that there would be no crop. Is it not logical, then, that the destruction of the roots formed especially to feed those shoots will also shorten the crop? We have all seen trees growing in corners where little or no cultivation is possible and yet carrying heavy crops and we have wondered thereat. I believe we shall yet find that, cover crop or no cover crop, the proper thing in an orange orchard is to pour on the fertilizer and the water and cultivate no more than is actually necessary to accomplish this feeding and watering.

The desire of the editor at this particular time was, however, that some one should state the latest knowledge on winter cover crops, and so far I

have discoursed on the summer crop only. I can only say that I am still using melilotus indica as a standby for winter but am trying a block of purple vetch. A line in my old Spencerian copy book 40 years ago ran, "Quit not certainty for hope." And surely melilotus indica is a certainty. It may be driven into oblivion by vetch and the big horse bean, but the price of one big horse bean will buy a hundred seeds of melilotus, and they are ten times as sure to sprout and grow. I have already sowed some blocks of my orchard to melilotus and shall finish before October first. My practice is to irrigate, cultivate, and a few days later, while the ground is still moist enough to permit, make good deep furrows and sow the seed broadcast over them. It is not necessary to cover the seed in any way, the irrigating water and the rains will attend to that. Should hot and dry weather kill the plants which will be started by irrigation in the furrows there will still be enough unsprouted seed left on the intervening ridges to make a crop anyhow when the rains come. But if a good stand comes from the irrigation it will pay to keep pouring on the water for the sake of an early crop.

Cover Crops

By E. L. Koethen

WHEN the earth was in process of formation, the rocks had just cooled off, and there was no soil in which vegetation could grow. In course of time the rocks began to weather and disintegrate. Mosses formed in the mellow dust and, dying, left a deposit of organic matter. This process continued through long periods and finally ended in the growth of plants of a higher order, animals began to add to the accumulation of organic matter and thus our soils have been built up by slow but sure methods into fertile lands.

Man has found methods of accelerating nature's methods in many ways. The use of cover crops is one of these. Instead of waiting countless ages for the building up of humus deficient soils the farmer plants seed of plants that form a large tonnage of organic matter, and when grown plows it under that it may rot and become a part of the soil. As may be expected such a crop when plowed under into a moist soil is soon lost to view but its effect is magical in building up the soil.

Deficient in Humus

The chemist has declared our soils in this arid country deficient in humus. This was to be expected, large crops of herbage are not produced naturally in this climate. While what plants there are grow with deep roots and deposit humus at greater depths than in soils of humid climate, the aggregate amount of humus contained in the soil is much less. For this reason it is necessary that we should seek to build up the humus content of our soils. The past history of our methods has been just the contrary. While the soil was in dry farm crops it was the custom to burn the straw and allow the humus content to continually decrease. Then when the orchards were planted this wasteful method was continued. It was claimed that the use of manure on citrus orchards was injurious, getting the idea from Florida where it is even now claimed that it induces dieback to apply manures. The continual practice of clean cultivation is continually burning up the humus content and so it is no wonder that we often hear the claim made that the citrus orchards are not as productive as they formerly were. This has been illustrated vividly by observing the planting of oranges on land which had been in alfalfa for a period. The growth in such cases has been wonderful to behold for a time, but if the addition of humus material has been neglected they soon went back to deficient wood growth.

Humus the Soil Solvent

Humus has been referred to above as an essential to real fertility. It is not necessary here to define just what this mysterious substance is. Suffice to say that it is decayed or decaying organic matter. It is the soil solvent which has the power to dissolve inert potash, phosphoric acid and other unavailable materials which may be in the soils but of no value because of their being in a form not suitable for plant feeding. For these reasons it is not likely that we will soon find any method of supplying this substance in sufficient quantities to overstock the soil. Every method of accumulation should be hailed with satisfaction if not too expensive. Manures are expensive and there is not a sufficient supply in sight to supply the demand. Alfalfa hay is excellent but is also expensive. Straw is good but should not be applied in the spring as it delays nitrification. Any refuse material found on the ranch that will decay should be converted into humus material, but after all is counted there is still a deficiency which can be supplied in the form of cover crops.

Accretion of Nitrogen

The above treats of the accumulation of humus alone, but it is also possible to increase the nitrogen content of the soil by the use of the proper kind of cover crops. We are often met by the objection that a cover crop "takes more from the soil than it returns." This is not true. In the case of barley and other non-leguminous crops it is true that very little new matter is placed into the soil. It is now known that most cultures do take a certain amount of nitrogen from the atmosphere, but it is in such small quantities that it is negligible. But all the matter that comes from the soil in growing a crop is returned to it when it is plowed under and decays. In addition to this there is a considerable amount of carbon taken from gasses absorbed by the plant that goes into the soil that was not there before. But what is of more interest is the fact that it goes back into the soil in what we call organic matter. The minerals that were taken from the soil cease to be mineral simply but are subject to action of living organisms and the soil is transformed from an inert mass to a home for billions of living things that are put to work for our benefit.

Legumes Desirable.

Such plants as peas, beans, clovers, vetches and others have the power through the intervention of bacteria to take nitrogen from the air. Other plants live in the air which is two-thirds nitrogen, but can only to a very limited extent take it into their organisms. Even the ancients knew that clover plowed under improved the soil and made it fertile. But they never dreamed of the reason why. Now the question comes as to which legume to plant. There are many that have been tried, and most of them have been good, but there is a choice. Among the first plants used were Canada peas. A fine tonnage was obtained and they made a rapid growth where the soil was inoculated for them. But it was soon found that they were subject to frost injury in exposed places, and what was still worse, after a few crops in succession lice attacked them and they were practically abandoned. The common vetch or winter vetch came next in popularity. But it also succumbed to the attacks of the lice.

Of late we have been informed that the purple vetch has made the best tonnage of all the plants tried at the experiment station grounds.

Of all the plants thus far tried out we think the yellow melilot has shown the least objectionable features. It is hardy, comes up whenever the climatic conditions become favorable and makes a very large tonnage when at its best. No enemies thus far have attacked it, but its one defect is its slow growth. That is, it grows fast enough in the spring months but lags during the fall and early winter.

Plant an Orchard

Our foothill soil and location produces a tree that for hardiness, good roots, and freedom from disease cannot be duplicated by any other section

Growing fruit is the best paying business in California.

The acid test of any business is not what it will do under favorable conditions but what it will do under adverse conditions.

Even under this year's depreciated values, the orchardist with a block of **Prunes, Bartlett Pears, Apricots, Cherries, Raisins, Shipping Grapes, Clingstone Peaches, Drying Peaches, Fall Pears, Almonds, Shipping Peaches, Shipping Plums, Canning Plums,** and **Figs** will make more money than the grower of grain, hay, alfalfa, beans, rice, or the dairyman.

The trees you plant now will, five and six years hence, assure your share in the profits inherent to the California fruit grower.

The supply of trees in the State available for planting is not over 60 per cent of the trees budded last fall. **This will result in a shortage of some of the best standard varieties.**

We offer for your planting the most complete assortment of commercial fruit varieties.

Our trees are the best that care in propagation and efficient workmanship can produce.

Our catalogue, full of accurate practical horticultural information and suggestions, and our thirty years' experience in fruit growing and fruit marketing, are at your service for the asking.

Submit us a list of your tree wants for quotation while the varieties you desire are still available in our foothill grown stock.

Write me today.

Rediscount of Citrus Paper

THERE was never such appreciation of the use of credit and the power of credit in handling the crops and productions of orchard and farm. From time immemorial the farmer "who has to borrow" has been looked upon with suspicion, at least by some of the overcareful. True, some of these have been borrowers without vision as to the outcome, who have failed to meet their obligations and have discredited the whole credit system. Meantime the middleman, or possibly the miller, the canner, or other manufacturer or finisher of farm products, has borrowed almost unlimitedly at low rates of interest, making quick turn of the product and usually large profits. There is no reason why the producer of ability may not carry on his plant with the minimum of investment, using at harvesting and marketing time his credit to carry, for the few days necessary, the large final expense on the crop. But producer's paper has not been considered sufficiently "liquid." Bankers have not devised a system which seemed to meet the needs of the farmer, and the good old plan of holding him up for long interest and often for a still longer "commission for securing the loan" for him has resulted in overcharge of the man who is least able to bear it. The federal reserve bank has corrected some of the abuses, the war finance corporation is still further aiding, and perhaps of even greater importance is the fact that city bankers are realizing that their true prosperity rests on the success of the farmers, and the success of the farmers rests, at least in a great part, on the proper system of credit.

Cotton growers, grain growers, wool producers, and now the fruit growers are being aided through the war finance corporation, and this has been of material aid, at least according to the belief of many, in a more satisfactory movement of California fruits and, in fact, all crops.

The California Fruit Growers Exchange has been investigating as to rediscounting paper with the federal reserve bank. Farrand & Slosson, attorneys at law, have made extended study of this, and have reported their conclusions directed to fruit growers associations, members of the exchange. This report reviews procedure required by the federal reserve bank and by member banks dealing with it, also authority of the various associations and necessity of their having in their articles of incorporation and by-laws clauses specifically authorizing borrowing by the association. The report also refers to the form of note required and to the financial statement which must be made, and closes with this summary.

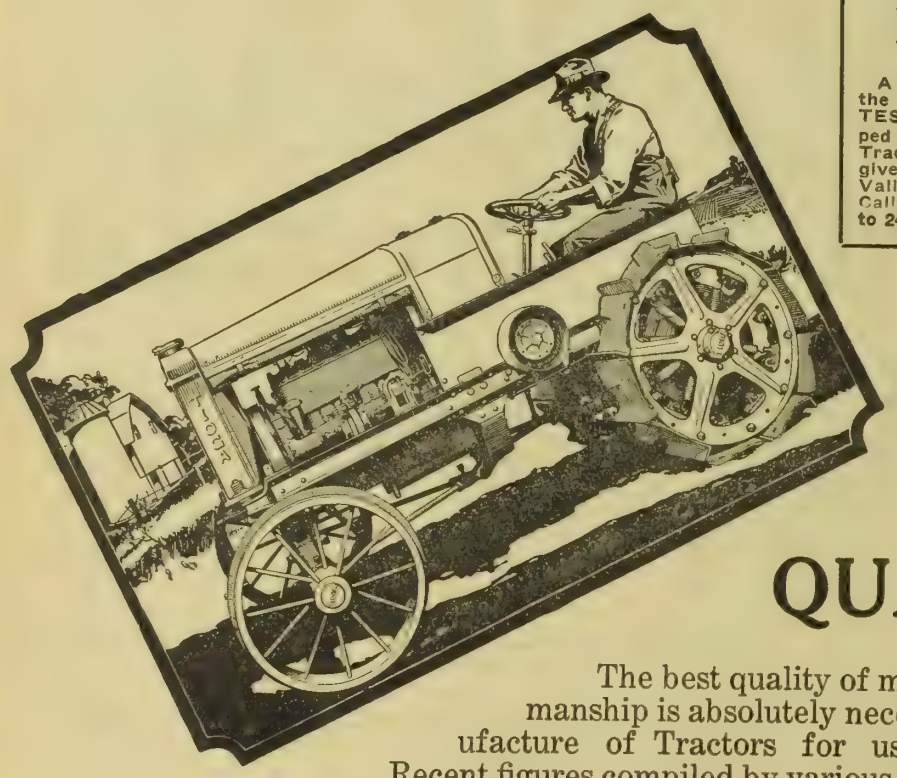
Summary

The file which a local association submits to its local banker accompanying its paper intended for rediscount should show that the association has been properly incorporated, that it has legal authority to engage in the business of picking and packing fruit, that it has legal authority to borrow money, that it has authority to borrow money for particular purposes in question, that there are no clauses restricting this authority of the association contained either in the by-laws or articles of incorporation, that contracts do exist between such local association and its growers whereby such growers definitely authorize the association to receive, pack, and market their fruit, and in so many words authorizing the association to deduct from the proceeds of the fruit when sold the amount of the association's charges for receiving, picking, packing and marketing the fruit; the amounts to be paid the grower to be deferred until after such expenses are paid; in other words, giving the association a lien upon the fruit and the proceeds for the repayment of these charges. It is not sufficient that it be the understanding or the practice of the growers and the local association that such liens do now exist, or that the association may make such deductions; for the purposes of rediscounting the paper such understandings must be reduced to writing and be a part of the agreement between the growers and the association. It is a matter of federal reserve bank policy and of policy of the bank in local communities, that debts for permanent improvements should not be carried as mere commercial loans. That policy is to the advantage of the local bank, as well as to the advantage of the local association; the payment of debts for permanent improvements should be deferred or secured, or both deferred and secured, according to the situation which presents itself in each locality, but for the purpose of the present discussion, it will be necessary in order to rediscount the association paper with the federal reserve bank that such debts be either deferred as to maturity date or secured. When so deferred or secured and removed from the list of current debts, the financial statement of the association will then show that its sole current borrowings are for current purposes, namely, picking, packing and marketing the fruit; that it has as assets to repay such debts the fruit of the growers in the house. in transit, sold, and in process of collection. Its financial statement thus shows the necessary ratio of quick assets to current debts, and the paper will be found to be both eligible and acceptable for rediscount.

Any bank desiring to offer local association paper for rediscount should receive the cooperation of the local association in order to comply with the suggestions set forth in this statement. The federal reserve bank desires that the right of the association to engage in the business in question, to borrow money, and that such association does have the requisite legal authority, be evidenced, in addition to the documents submitted, by the opinion of the association's attorney, that such is the legal effect of the documents submitted.

Many of the local associations are already in a position to comply with everything set forth in this statement and with each and every requirement of the federal reserve bank; some will be required to take out of their list of current debts moneys borrowed for permanent improvements, which can be done by deferring the maturity date or securing the same. That would not be a bad idea, entirely independent of rediscounting paper with the federal reserve bank. There are some associations which undoubtedly cannot at present comply with these requirements. If they shall desire to rediscount their paper changes must be made in articles of incorporation or in by-laws or in contracts, or in both, so that when such changes are made the requirements of the federal reserve bank will be met with.

It may seem at first that these requirements are numerous and difficult to comply with, but in most instances such will not be found to be the case. If any great desire exists on the part of local banks or local associations to qualify the paper the way is now open, and such qualification can be had without serious inconvenience. The federal reserve bank has never doubted the "eligibility" of the paper, and



NOTICE

A daily demonstration of the TIOGA STRENGTH TESTED TRACTORS equipped with P. T. (Positive Traction) Tracks will be given at the San Fernando Valley Fair, San Fernando, California, September 19th to 24th.

QUALITY

The best quality of material and workmanship is absolutely necessary in the manufacture of Tractors for use in California. Recent figures compiled by various Universities show that the average use of a tractor in the Middle West and East is about 30 days a year. THE AVERAGE USE OF A TRACTOR IN SOUTHERN CALIFORNIA IS OVER 150 DAYS A YEAR.

The Tioga Strength Tested Tractor Has Been Built to Meet California Conditions

It has STRENGTH because it is built of the best material available and the finest workmanship is used. It has been thoroughly TESTED in all the usual and many unusual ways to discover weaknesses and when found were corrected until now the TIOGA TRACTOR is as complete and perfect a machine the best engineering talent can produce.
QUALITY is a virtue which cannot be lifted aside, for a price more interesting.

"Tioga Strength Tested Tractors and Quality Are Synonymous."

Chief Consulting Engineer

has upon full consideration and discussion concluded that if the financial statement is set up as herein outlined, segregating borrowings for current purposes from those borrowings represented by permanent investments, and if, after such setup the amount deductible from fruit payments is sufficient to properly margin the current borrowings, the paper of such association will be acceptable for rediscount.

The exchange system of marketing citrus fruit is essentially a business organization. Local associations by using its facilities secure the maximum distribution of their output at a minimum of expense. The exchange's marketing cost is the lowest of any organization marketing perishable products in the United States. During the season just closed the exchange shippers sold through its facilities approximately $60,000,000 in value, with a loss from bad bills of not to exceed $435.83. During a 17 year period product to the extent of $376,000,000 was sold with a loss not to exceed, from bad bills and other similar causes, of $8,775, or approximately 9-4000 of one per cent of the f. o. b. returns.

The reputation of the exchange system, and of the local associations composing its membership, for business integrity and for the repayment of their obligations, is of the best. By making available to the local associations and to their bankers the extended resources of the federal reserve system in financing the packing and marketing of their output, an added element of strength is furnished to the industry, and is an opportunity which will be much appreciated and made use of by the local associations and their bankers.

FARM BUREAU ANNUAL

The Los Angeles Farm Bureau will hold its annual meeting at Ganesha Park, Pomona, Wednesday, September 28. Official notice has been sent out that every one of its more than 2,000 members is expected to be there at 10 o'clock sharp. At that hour several departmental meetings will be held, notably those of dairymen, potato growers, and poultrymen. At 11 o'clock the business session will commence with reports from these departments. The election of officers for the coming year will follow and all business must close at 12:30, for then

Everybody Will Eat

Every member is asked to bring his own lunch, also a knife, fork, spoon and cup. The latter will be filled and refilled, free of charge, with coffee, sugar and cream provided by the Pomona Valley center. Though you bring your own lunch the committee in charge ask that you turn it over to them for arranging and serving, retaining only your dining tools. At 2 o'clock the program will commence with addresses by prominent speakers, one of whom will be Dean Hunt of the state university. After the speech making will follow the awarding of 31 silver loving cups and other prizes awarded in the dairy cow competition. The last feature on the program will be a visit to the grounds where the egg laying contest is to begin the Saturday following. The buildings recently erected will be of interest to all, especially to poultry raisers.

BEVERAGE EXPOSITION

California grape syrups and other grape products are to be featured at the coming Beverage Exposition to be held in St. Louis, October 24-29. The exhibit is to be in charge of Mrs. Margaret Coulson, assistant in viticultural work in the state department of agriculture. The Grape Grower says: "For a number of years Mrs. Coulson was connected with the state board of viticultural commissioners at Sacramento, and at present she is in charge of the San Francisco office of the viticultural division of the state department of agriculture in the Ferry building at San Francisco. She has had considerable experience in exhibit work at state fairs and various land shows and is familiar with every phase of the grape industry."

FURROW-MANURE DISTRIBUTION IN CITRUS ORCHARDS

(Continued from Page 279.)

plied every year, the broadcasting constituting simply an additional application.

Concentrated Fertilizers in Furrows

The question is frequently asked as to whether or not concentrated commercial or other fertilizers should be applied in the manure furrows. If the concentrated fertilizer is to be applied at the same time as the stable manure or other coarse organic fertilizer, it seems probable that it can safely be applied in the same furrows. On the other hand, if the commercial fertilizers are applied during the winter or early spring seasons after the manures have been distributed in the furrows, as is usually the case, it seems likely that they should be broadcasted or applied in the irrigation furrows as is often done. One of the leading growers who has used the furrow-manure method since its introduction has recently told the writer that he does not believe that the highly concentrated fertilizers should be applied in the manure furrows. Others have expressed their opinion that it can be done with the best of results. Differences in soil or other conditions probably explain the differences of opinion in this regard.

General Observations

Last September the writer visited an orange ranch in northern California where manure was being broadcasted in the orchard. Some of the manure was lying out exposed to the sun and weather and had been left in this condition several days. From the recently distributed manure one could smell strongly the escaping plant food. It was really painful to observe this loss, especially where the pale and pitiful looking trees showed such a striking appearance showing the need of fertilizer. One of the members of the party said to the foreman: "Why don't you use the furrow-manure method and save this apparent loss of plant food from the manure?" The foreman replied: "Yes, I have read all about that 'trenching' system. It is one of them new-fangled notions put out by some professor. Anyhow it's too much trouble for me. I am a practical orange man." The only comment necessary was that his trees looked like his talk.

Now that the cost of stable manure, alfalfa hay, and bean straw has come down in price within the reach of the growers, the method of their application should be carefully considered. There are opportunities in every district to consult with users of the furrow-manure method and for studying the results of its use for, in some cases, a period of several years. The writer believes that it will pay every grower interested in this matter and not now using this method to investigate such cases and consider a trial of the furrow-manure method this fall.

SWEEPSTAKE AWARDS AT STATE FAIR

Complete horticultural sweepstake county awards have just been announced by the horticultural judges of the 1921 California state fair. These awards were as follows:

Apples—Humboldt, 1; Mendocino, 2.

Pears—Yolo, 1; Placer, 2; Fresno, 3.

Peaches—Kings, 1; Fresno, 2; San Joaquin, 3.

Plums or prunes—Fresno, 1; Kings, 2; Placer, 3.

Table grapes—Kings, 1; Fresno, 2; Yolo, 3.

Citrus fruit—Los Angeles.

Best exhibit of dried fruit—Fresno, 1; Kings, 2; Yolo, 3.

Best, largest and most varied exhibit—Stanislaus.

Best, largest and most varied and artistically arranged exhibit—Stanislaus, 1; Kings, 2; Fresno, 3; Yolo, 4.

Best, largest and most varied and artistically arranged exhibit of beans—Fresno, 1; Yolo, 2.

Same of flours and meals—Yolo, 1; Fresno, 2.

Best, most comprehensive and instructive exhibit of castor beans—Kings.

Most meritorious exhibit of rice—Colusa, 1; Yolo, 2.

Manteca sprang a surprise on Lodi by winning the first prize for Flaming Tokay grapes, heretofore always considered Lodi's own.

Colusa County won the first prize for improved French prunes, while Placer walked away with the Hungarian prune award, and also the giant plum prize. Yolo County created surprise by winning the first prize for cantaloupes away from the famed melon districts of the San Joaquin Valley. She was also the only county to win a first prize for an apple variety, except Humboldt. Her Ben Davis entry won high honors.

Colusa County was next to Los Angeles in lemons. Kings captured all apricot first prizes except one, Royal apricots, which went to Yolo. San Joaquin County won three nectarine firsts, Kings two, and Fresno and Placer each one. Stanislaus won first in Calimyrna figs, while Fresno was first in Mission and Kadota figs.

The sweepstake prize for the most extensive, perfect and varied exhibit by one person or farm went to the Northern California Counties Association.

OBJECT JUSTIFIES MEANS

Mrs. C.: "Why did you give the girl such a good recommendation. I find her impossible. I don't know what to do with her."

Mrs. D.: "That's just the reason I had to do it in order to get rid of her. I was in the same fix as you are now."

Would you take medicine by a correspondence course?

THEN be careful how you allow oil charts to influence you in buying lubricating oil and greases. Just the same as a doctor prescribes certain medicines for each separate case, so does a good mechanic recommend oils of certain grades for different types of motors.

The age and condition of your motor determines the grade of oil you should use. As you choose a family physician so should you choose a mechanic or garage man. Once you find him, grapple him to you with hooks of steel and let him be your autodoctor exclusively.

Oil charts are to be used only when there is not a mechanic's advice available.

Muscle Shoals Monopoly

GIFFORD PINCHOT is out in open fight against granting to Henry Ford or anyone else the monopoly of the wonderful power possbilities of the Muscle Shoals on the Tennessee River which the government took up during the war and spent millions upon as a war measure in securing power from these rapids for the purpose of making nitrates for ammunition purposes.

Henry Ford proposes to take possession of this great property, and all its power, under an offer which Mr. Pinchot thinks is very favorable to Mr. Ford and not favorable to the people of the U. S. A.. Mr. Pinchot writes:

"The first part of the Ford offer is to lease the Wilson dam and Dam No. 3 for 100 years, with indefinite renewals, provided the government will complete them and install machinery to produce 850,000 horsepower. Mr. Ford offers to pay six per cent on the 28 million dollars which he estimates will be necessary to complete this work, or 3 4-10 per cent on 48 million dollars, Mr. Ford's own estimate of the whole government investment in dams, locks and power houses. Even if we add all other annual payments (the so-called amortization payments, and payments for the repair, maintenance, and operation of dams, gates and locks), the total would be equivalent to interest at the rate of only 3 6-10 per cent. Mr. Ford offers also to give the government 300 horsepower to operate the locks.

"Please note that for the waterpower itself Mr. Ford would pay nothing, and that he would be free from all taxes on the property. Other lessees of waterpower rights from the government not only bear the total cost of building their own dams and powerhouses and pay taxes on them, but they also pay for the waterpower in addition. The Ford offer is like offering a man 3 6-10 per cent on the cost of his factory as rent, and then asking him to throw in a coal mine to supply fuel for the engines for nothing.

"There is no allowance for depreciation, and the government would beyond question have to pay the cost of injury to the dams or locks from floods or other causes. Moreover, there is nothing in the offer to indicate that the government, in order to protect its own property, would not have to bear the expense of replacing enormously costly machinery when it had been worn out in Mr. Ford's service.

"The second part of the Ford offer is to buy Nitrate Plant No. 1, which cost the government in round numbers 13 million dollars; Nitrate Plant No. 2, which cost the government in round numbers 70 million dollars, and other property, which brings the total cost to 85 million dollars, and to pay 5 million dollars for it all. The property for which this offer is made includes steam machinery to produce 160 thousand horsepower, which alone is worth far more than Mr. Ford's offer for the whole. In addition the government is to buy from the Alabama Power Company the land upon which certain of the foregoing structures were built, and to turn that over to Mr. Ford also.

"In return for the lease, for the purchased property, and for the waterpower without charge, Mr. Ford offers in addition to the payments mentioned above, to do three principal things:

"First, 'to maintain Nitrate Plant No. 2 ready to be operated * * * in time of war for the production of explosives,' and in the event of war to turn it over to the government for that purpose.

"Second, 'to operate Nitrate Plant No. 2 to approximate present capacity in the production of nitrogen and other fertilizer compounds,' and in this business to limit his net profit from the manufacture and sale of fertilizer products to eight per cent.

"Third, the offer as written suggests producing, but contains no direct proposal to produce, fertilizer for the benefit of American farmers. That could, of course, be corrected in the final contract, for I have no doubt that Mr. Ford desires to make fertilizer at a total net profit of eight per cent. Nitrate Plant No. 2, however, is not adapted to making fertilizer, but only cyanimid, one of several materials used for the production of fertilizer, and not one of the best at that.

"The fact is that the Ford offer is not mainly a fertilizer proposition. It is seven parts waterpower to one part fertilizer, even if the fertilizer part should work out. For, if Nitrate Plant No. 2 were to be permanently employed in the manufacture of fertilizer it would consume but 100 thousand horsepower out of the 850,000 installation. This is the heart of the whole matter.

"As a waterpower proposition, the Ford offer is in every important point directly contrary to the Roosevelt waterpower policy, which after 15 years of struggle was finally enacted into law last year.

"The Roosevelt policy provides that all waterpower leases shall be limited to 50 years. The Ford offer asks for 100 years with indefinite renewals.

"The Roosevelt policy provides for return of the government work at the end of fifty years. The Ford offer provides for indefinite private possession of the government works.

"The Roosevelt policy provides for regulation of the price to the power consumer. The Ford offer, so far as the United States is concerned, provides no check on what the power consumer must pay.

"The Roosevelt policy provides that public waterpower taken for profit shall make a return to the public. The Ford offer asks for many hundred thousand horsepower for nothing.

"The amount of power Mr. Ford could develop, under his offer, is greater by half than all that is now being developed at Niagara Falls. If Mr. Ford were to pay for it at the rate charged by the government to other companies that build their own works, as Mr. Ford would not, it would cost him about 150 thousand dollars a year.

"Beyond question Nitrate Plant No. 2 ought to be maintained in condition for producing explosives in case of war. Most certainly it ought to be used for making fertilizer for American farmers. The wisdom of developing the waterpower on the Tennessee and its tributaries is beyond question. But all these things can be done with fairness to the public.

"I do not believe that Mr. Ford's offer should be summarily rejected. I do believe that it should be changed.

First, to make it fit the Roosevelt waterpower conservation policy, now the law of the land; second, to make it pay for the property of the people something approaching what that property is really worth; and, third, to make what it offers to the farmers clear beyond doubt.

"It is said that certain Wall street magnates who hate Mr. Ford are anxious that his offer should be rejected. What these men think about Mr. Ford and his offer is surely no reason for giving him public property of enormous value for a consideration wholly inadequate and on terms utterly unfair to the public.

"I should be glad to see Mr. Ford make money, and plenty of money, out of taking over the property of the people as he proposed to do, but not such perpetual and gigantic profits as his offer would assure. It is fair to consider the public also, and to remember that all the annual payments Mr. Ford offers to make would amount to only one-third of the yearly taxation necessary to meet the interest charge (at the Liberty Loan rate of 4¼ per cent) on the government's net investment in the property he proposed to take over, and that he would get the waterpower for nothing."

STATE GRANGE WILL CONVENE

The 49th annual convention of the California State Grange will be held at Yreka, October 18. Arrangements are made for a special car on the train leaving Sacramento at 12:30 a. m. October 16. Free auto camping privileges are provided at the Yreka Auto Park for those who wish to travel in their own cars. Those who wish accommodations in hotels or private homes are urged to communicate as early as possible with W. L. Kleaver, Yreka.

Cover Crops Improve Soil

PLANTING cover or green manure crops is a matter which requires attention in September in most parts of the United States, says the United States department of agriculture.

Clover, vetch and other legumes serve the triple purpose of adding humus to the soil, accumulating nitrogen, and preventing soil erosion. With some tender berry and fruit crops they also serve to protect the roots from severe winter weather. Outside of the nitrogen forming plants, rye is largely used as a cover crop sown in the fall and plowed under in the spring to add organic matter to the soil. The cover crop problem varies largely with locality, but for over winter purposes there is one rule which is universal, and that is to get the crop in the ground in time to secure good growth before freezing weather.

Long Standing Practice

The use of clover or some other legume to enrich the soil is generally considered a cardinal agricultural practice in the humid sections of the United States. It antedates by three-fourths of a century the monumental discovery that legumes store up nitrogen from the air. The belief that clover was a valuable improver rested first on experience, and later experience was substantiated by the discovery of the relation between the legumes and the nodule bacteria.

Other legumes, as the cowpea, the Japan clover and bur clover in the South, and crimson clover on the Atlantic coast, have come into use in the territory not well adapted to red clover. The various vetches are held in widespread favor, different varieties being employed according to climate and crop conditions.

When to Sow

The time of planting and the best crop to use is a matter which local conditions must dictate. Along the north Atlantic coast it is considered best to get these crops in from the first to the middle of August, while in the extreme South the planting may be deferred to early October. In the extreme North hairy vetch is favored as a legume cover, or green manure crop, but rye is also largely planted. From middle Pennsylvania to the north Alabama line crimson clover gives good results. In the extreme South bur clover, vetch and crimson clover are used, as well as velvet beans and cowpeas.

In the extreme Southwest, particularly with the orchardists of Southern California, common vetch is sown in the fall and turned under as early as possible in the spring. Purple vetch is preferred, as it can be turned under one month earlier than other varieties, but until recently there has been extreme scarcity of seed, a condition which is being remedied through the efforts of the department in getting the seed grown in more northern sections of the coast.

Sour clover is used to a large extent, as the seed is cheaper than that of the vetches. Farther north on the coast common vetch gives good results, while east of the mountains in the Northwest hairy vetch is used because of its cold resistant properties.

Broadcasting

Methods with cover crops vary greatly. In the South they are customarily sowed between rows of cotton at the last picking. It is also common to sow the winter crop between corn rows before harvest. Wherever clean cultivation is practiced the soil is likely to be in shape for broadcasting the seed. If convenient, it can be harrowed in. In orchards a light harrowing or disking may be employed if the ground is free from sod. Care must, of course, be taken not to injure the roots. The crop is usually plowed under in the spring, but this is not always done with orchards. Data collected in all parts of the United States show a general benefit from this form of agriculture.

Cover crops are of especial value to small gardeners and truckers, who often find it both difficult and expensive to obtain stable manure. They add the humus which is so necessary to maintain a good physical condition of the soil. Wherever there is a vacant place in the garden a few seeds of rye, vetch, clover, etc., may be sown and raked in. If a suitable rotation of crops is followed all parts of the garden may be covered with a green manure crop once every two or three years.

THE FARM BUREAU EXCHANGE

Forms of organization for county and state farm bureau exchanges in California are explained in a publication issued by the College of Agriculture of the University of California and edited by William R. Camp. The farm bureau exchange has grown out of the need of the farmers for an organization for business purposes in the marketing and distribution of their products. The articles of incorporation and by-laws drawn up by the division of rural institutions is presented in the publication. Separate county farm bureau exchanges are to be formed and then in turn they become members of the California Farm Bureau Exchange. Forms and applications for membership in both organizations are described in the circular which can be obtained from the College of Agriculture of the University of California at Berkeley.

NEW ALFLAFA CIRCULAR

A new state university publication on alfalfa, Circular No. 87, is now ready for distribution to anyone interested who writes and requests it. This circular is written by Prof. W. T. Clarke and deals with soil, water and climate requirements for the raising of alfalfa and the time of irrigation and cutting. Write for it to College of Agriculture at Berkeley.

GOLDEN MEALY BUG

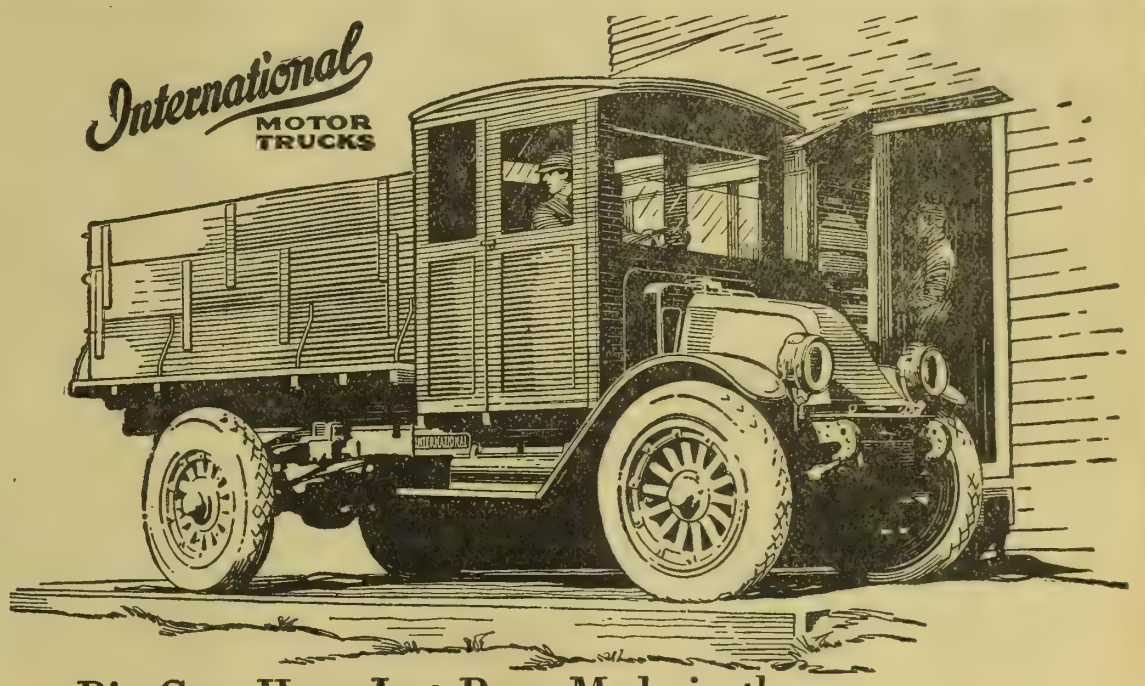
Horticultural Commissioner Ryan reports infestations of the golden mealy bug, Pseudoccocus aurilanatus, have become so bad in the auracaria trees in and around Los Angeles and Pasadena and have so resisted all attempts at controlling them that it is encouraging to receive from all sections the reports of their natural enemies becoming so plentiful as to be considered a nuisance. One such report was that the Hyperaspis (ladybird beetles) came on the porch and attached themselves to the protected places in such numbers that they were a worse nuisance than the mealy bugs in the trees and that they were in such numbers on the ground and cement walks that when washed away with the hose a white foam formed on the water. From material brought to the office, not only Hyperaspis has emerged but large numbers of brown lace wing flies and a smaller number of the green variety. Some specimens not yet emerged appeare to be Scymnus.

STUDYING IN THE ORIENT

Prof. C. W. Woodworth of the state university has a fund of most interesting information as to the oriental viewpoint and the oriental way of doing things. He recently spent some 12 months as instructor in an agricultural college maintained by an interdenominational mission. Agriculture is being taught the bright students in this school in order to make them more efficient as teachers for natives in inland sections which are not accessible to English speaking people. Agriculture is not taught in state maintained schools, but this school with which Prof. Woodworth was connected is proving most popular and is encouraged to the fullest by state officials.

DRIED PEACH PRICES

California Peach and Fig Growers announces another increase on 1921 dried peach price; 1¼ cents on standards, ⅜ on choice, 1½ on extra fancy.



Big Cuts Have Just Been Made in the Prices of International Motor Trucks.

Take Advantage of the Fact and Invest in Economical Hauling.

THE FARMERS of America have invested in 80,000 motor trucks because it is so obvious a fact that the use of horses for hauling—horses plodding at snail-pace over the roads these modern times—is an extravagant waste. Such practice is a millstone on the neck of the farmer's time, and the owners of the 80,000 have thrown the millstone off. They have advanced a long step toward maximum farm efficiency.

On the basis of the 15-year history and reputation of International Motor Trucks in city and rural hauling, we urge you to consider the present complete line of Internationals. Sizes range from the 1,500-pound Speed Truck to the heavy-duty 10,000-pound truck—a size for all needs. Price reductions range from $100 up to $900 per truck. When you come to the revision of your own hauling methods, trust one of these trucks, and International Service, to work for you faithfully.

The Harvester Company has been working very long and intimately with farming and farm problems. Its products are practical and successful farm machines. It has built a good reputation among farmers out of 90 years of experience. Because of that, we ask you to rely on the International Motor Truck. Write us for the address of the nearest distributor.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Paris Green for Bugs

Please let me know what bugs Paris green is good for. Should it be applied with hot or cold water and how strong should it be mixed? — Subscriber.

Paris green is effective only with bugs which have jaws and eat portions of the leaves, fruit or bark. Scale, aphis and other bugs having sucking tubes may not be reached with Paris green or other poison spray. The rose chafers, squash bugs, twelve spotted beetles and others of the larger eating insects may be reached by applying a poison to leaves or fruit. One of the most common of these poisons is Paris green. A good formula is as follows: Paris green, 1 pound; air slaked lime or dehydrated lime, 5 pounds; water, 200 gallons. Stir the poison into a thin paste with small quantity of cold water. Add that to the lime and strain into a tank containing the water.

Share of Oil

What royalties are customary for oil companies to pay land owners for oil found on their land? Please give maximum and minimum.—Subscriber, Crows Landing.

There are almost as many different ways of dividing profits on oil as there are oil wells. Roughly, and to give an approximate idea, one-sixth of the oil developed usually goes to the owner of the land, sometimes in percentage of oil as it comes from the well, again one-sixth of the net cash return after all expenses are paid. This, of course, is vastly more attractive to the one doing the developing. The owner of land offered an oil lease should employ one of the best attorneys to attend to his interests, for if oil should be developed it might make vast difference as to wording of the contract. Usually the land owner exacts a certain cash deposit and agreement that work shall proceed within a certain time and that a well or a certain number of wells be begun and completed within a certain time. Otherwise, if the land owner makes indefinite lease he may sign away rights to his property for a period of years without securing a penny in return.

Cover Crop

What would be best to plant for green cover crop to be plowed under in apricot and apple orchard, not irrigated?—Subscriber, Watsonville.

The only leguminous crop you could grow would be bur clover, but would suggest the use of barley as better.

Pruning Young Walnut Tree

I have a budded walnut which is nine feet high and which has side shoots clear up to top. This has not been pruned at all. What shall I do for it?—R. A. M., Pasadena.

Leave it alone for this year. It evidently is doing well and needs no pruning.

Drying Zante Grapes

Will you please advise me as to the best and easiest method of drying Zante grapes for currants and as to the best way of removing the small stems from the dried currants?—Subscriber, Folsom.

Zante grapes are dried in the same way as other raisin grapes. Practically the only difference in the method is that currants require a little less time to properly dry.

The small cap stems on currants are best removed by the regular cap stemmer or recleaning machine used for Thompsons. For small amounts it might help to dry the currants as much as possible, even using a slight amount of artificial heat. Place them in a receptacle which can be violently agitated, as these small stems are easily detached when both the fruit and the stem are very dry.—F. K. H.

Alkali Water

Have gained much valuable information from your paper. If the following problem has been taken up it has escaped our notice. Is there any way in which water, decidedly alkali, but otherwise untainted, can be treated to render it fit for cooking and drinking. To meet our need, the method should be simple and inexpensive.—Subscriber, Del Mar.

Certain well waters of arid and semi-arid regions contain considerable quantities of alkali, especially sodium carbonate, in solution. This gives to light colored vegetables cooked in such waters a yellowish color that is very objectionable, and, if present in excessive amounts, renders the water unfit for drinking. There is no entirely satisfactory method of treating these waters. A certain amount of relief is obtained in some cases, however, by adding calcium sulphate in the form of gypsum or plaster of Paris. This neutralizes, to a greater or less extent, the sodium carbonate giving rise to the objectionable alkalinity.

Cory Thornless

In answer to a question asked in the Cultivator of August 27, concerning Cory's Thornless blackberries, will say that we raise them and find them a success. They are a heavy producer where one can irrigate them. I should think it a very good idea for the Tulare farmer to plant his two acres to Cory's Thornless. It is a joy to pick them as there are no sore fingers and arms. We live two and a half miles from the coast and the soil where the berries are planted is a sandy loam.—L. Landon, Watsonville.

Tomato Blight

What is the best way to prevent blight from taking a tomato patch?—Subscriber, Shafter.

There is no remedy; only preventive measures are successful with this pest. Once the blight is apparent from the curling and partial drying of the leaves the plant is entirely beyond help. Disease free seed in disease free soil should be the aim for another year. With the present crop the moment a plant begins to show the characteristic curling it should be removed and burned so as to prevent, so far as possible, the infection securing hold in other plants.

Codling Moth and Mealy Bug

What is the difference between codling moth and mealy bug, and what is the treatment for each?—Subscriber, Pasadena.

The codling moth is a small grayish brown moth that is seldom seen. It is the worn of this moth that does the damage and is so much found in apples and pears. The mealy bug, of which there are several species, is more or less covered with white wool. You could easily confound the mealy bug with woolly aphis found on apple trees. As it is too late for treatment for this season's crop will refer the inquirer to special spray number of the Cultivator which will touch upon both these pests. This will be issued September 24.

Cartons or Pasteboard Containers

An inquirer writing from Anaheim asks as to cartons or corrugated containers for nuts, etc. The letter was answered by mail but returns "Uncalled For." If inquirers will use utmost care in giving us exact address we can often render service which may not be possible through our columns.

Corn Worm

What is best way to protect roasting ears from worms?—Subscriber, Shafter.

The old time remedy was to plant double the amount of corn needed so that the pests would perhaps not destroy all the ears. More recent treatment, however, has been the use of dry arsenate of lead used in small bellows or more often in bag of loose-

A Modern Home is a Wife and Mother Saver

Illustration shows the following "Standard" fixtures:
Pembroke Bath P2310 L with Shower, Laton Lavatory P-3110G, Expulso Closet L-2080
Other suitable and less costly materials than tile can be used for finishing bathrooms.

All authorities are agreed that of all the modern conveniences and improvements which have helped to make rural life attractive, none have been of such far-reaching importance as the modern water system and modern plumbing fixtures.

In a recent bulletin issued by the Missouri College of Agriculture the kitchen sink, bath tub, wash bowl and toilet, provision for heating water, and stationary laundry tubs are given first consideration in the ideal modern rural home.

Because, this bulletin states, such equipment reduces the hours and lessens the strain of work for farm women—protects the health of the family by providing a safe system of waste disposal—keeps the members of the household physically fit by providing better bathing facilities and more convenient arrangement for eliminating the wastes of the body.

If your home is not provided with these *first* essentials of your family's health, comfort and contentment, write for our catalogue of "*"Standard"* Plumbing Fixtures for the Farm." It describes the most complete line of practical, satisfactory fixtures obtainable anywhere and points the way to greater happiness for wife, mother, children—and you.

Standard Sanitary Mfg. Co., Pittsburgh

In addition to the displays of "Standard" Plumbing Fixtures shown by wholesale dealers and Contracting Plumbers, there are permanent "Standard" exhibits in the following cities:

San Francisco, 149-55 Bluxome St. Los Angeles, 216-224 S. Central Ave. Seattle, 1714 L. C. Smith Bldg.

Factories: **Pittsburgh, Pa.; Louisville, Ky.; New Brighton, Pa.; Toronto, Can.** ***Potteries:*** **Kokomo, Ind.; Tiffin, Ohi**

Save $60 a Year with a Sechrist Pressure Cooker

$1 Delivers Your Sechrist

The Sechrist Pressure Cooker saves a woman more in labor and time than can be estimated. Besides that—a Sechrist saves about SIXTY DOLLARS in fuel and food in one year's time.

Use the "cool-pack method" and your Sechrist for your canning. You will realize its great helpfulness only when you see how much time and fuel you have saved.

MOSTLY UP TO YOU

When the world's a-goin' crooked,
Or it looks that way to you—
Somehow seems to be a tangle
To 'most ever'thing you do;
When you start out of a mornin'
With your luck a-runnin' wrong,
The birds along your pathway
Have a harshness in their song
And the grass, though soft and velvet,
You will sort o' stumble through,
Sich times, if you want things better,
Friend, it's mostly up to you.

'Taint hard smilin' with the sunshine,
But it's during stormy spells,
When our weary feet are slippin',
That the stuff what's in us tells.
No—you won't have flowers allus
In the paths you travel through;
Still, if you would have things better,
Friend, it's mostly up to you.
—Farmer's Review.

LUCY BARNHILL'S GARDEN

(Concluded.)

"There's some places flowers won't grow," Mrs. Wiersema admitted, "and of course if they're not put in early enough or if they're planted too deep, why, then—But that brings me up to the thing I wanted to tell you. I wanted you should hear about Lucy Barnhill, who moved into this house in the fall, 21 years ago last November." She followed Rhoda's eye to the clock and added, "That is, if you've got the time to hear."

The girl made a little impatient gesture of assent.

Mrs. Wiersema went on: "Lucy came to this town that fall a plain little runt of a thing that nobody looked at twice; and she and her aunt settled down here in this house just 'fore snowfall, as I recollect. There wasn't anybody to show a smidgin of interest in her when she came. I was some older than she was and more taken up with the man I finally come to marry than I was with new neighbors. Come to find out afterwards, I guess nobody went near the house all winter, and she just slipped out after groceries and shut herself in again, without saying ay, yes nor no to a soul. Lucy Barnhill was quiet, but, land, when we come to know her—

"You see, along about the middle of April I pulled my head out of the clouds (Dave and I were engaged by then), and there I see Lucy Barnhill diggin' round the house with a hired boy to help and setting out bushes and things—bulbs in here and seeds over there,—anybody could see she'd put in a considerable garden. Right away thinks I, I'll drop in and see that girl.' I was fond of a garden, and so was Dave. But one thing and another came up, and I didn't go.

"You know how spring comes some years—such a little bit every day that you don't take notice, and then you just wake up some morning, and there it is! Well, sir, I'd been all took up with thinking of what I was going to be married in,—satin or velvet, I couldn't decide which, — and one mornin' I put up the shade and looked over here, and everything on the place had just jumped right out into leaf. The sweet peas were halfway up the lattice, and the snapdragons had got a start over there in the south corner. There was a great clump of pink spirea she'd put in next the steps, and bridal wreath and snowball on the other side."

Rhoda's eyes expressed an involuntary interest.

"What was in that bed just to the left of the gate as you come in?" she asked. "I've always wondered; there's a ring of stones left as if something had been planted."

"Seems to me it was these big cinnamon pinks," Mrs. Wiersema reflected. "There was a bed somewhere near the street; people used to lean over the front fence to sniff at 'em, going past. Next the fence 'twas lilies of the valley as thick as pins in a pincushion. There was no such another garden anywhere in the block, and, it turned out later, not anywhere in Hennepin. Just as soon as something new would begin to blossom, people would say to each other, 'You ought to go down Elm street and look at Lucy Barnhill's larkspur," and later it'd be 'Lucy Barnhill's fireball.' It got to be a great walk for couples.

"Lucy'd sent away for a crimson rambler to set out by the front porch, and it did real well even that first year. But the second summer if that bush wasn't a sight for angels I never expect to see one. It just took hold and went all over the porch and hung so thick with those little red roses I never looked out the window without catchin' my breath.

"Just as soon as those flowers began to come out, people began to fall over themselves to get acquainted with Lucy. You know how it is; folks on committees find it real handy to say, 'I'll get Lucy Barnhill to furnish roses.' First it was for that, and then it was for her.

"By the next spring Lucy had many a beau. 'Twan't many Sundays a rig wasn't hitched to that tie ring, sometimes as many as three. Seems like they couldn't give in she wasn't going to have them. My cousin, Elam Tenny, was one of them. It was nip and tuck between them all, as far as we could see, for the best part of a year. Then one afternoon there was a knock at our side door, and there stood Elam with a look on his face—goodness me, it took my breath away! He caught hold of my hand, and he says, 'Come on over to Lucy's, Henrietta. It don't seem possible—and I ain't worth it—but she's promised to marry me."

Mrs. Wiersema sat silent a moment, looking round the room. "And they was married right there in that bay window, and I stood up with her in a blue silk dress with rows of gray-silk stitching round the skirt every two inches."

Rhoda Lakin had been leaning forward in her chair to listen, with her dark eyes following Mrs. Wiersema's gestures. It was almost as if plain little Lucy Barnhill's wedding ceremony had just taken place in the quiet room.

Suddenly she drew back with a quick intake of breath.

"What good is all this to me?" she asked bitterly.

Her visitor laughed. "I've been all round Robin Hood's barn coming to my point," she admitted. "But I've got a point, and here it is. Do you want to get to know the young folks here and be in on their parties and picnics, or are you set on clearing out, like Lucy Barnhill admitted to me she come near doing?"

Rhoda made no answer to the question.

"Next week Lucy Tenny's oldest girl is coming to make me a visit, a month anyhow and maybe all summer. She's been here most every year since she was knee-high. Sometimes I think the young folks act plumb daffy about her, the way they carry on when she comes. I suppose it's just the Lucy Barnhill comin' out in Isabel.

"Now, here's what I want you should do. You take that $12 you got for a ticket and put it into seeds—seeds and bulbs and bushes. Isabel will be tickled to help you put them out; she's a master hand with plants. The little boys can spade. And the first day after she gets here I'm going to give a party for you two—a coming-in party for her and a coming-out party for you. I'll expect you to help me with the cakes and decorations, but you mustn't help serve, because you'll be a guest of honor."

Rhoda's laugh was bitter. "Me a guest of honor in Hennepin!"

"And now I've got to go start my supper," Mrs. Wiersema went on serenely. "I'll leave the catalogue here where you can look at it when you get a minute. Where there's extra good offers there's a leaf turned down. I'll look for you over this evening, and we'll pick out which grows best in this ground. We ought to get off an order tonight, so that the things'll get here about the time Isabel does. She's a hustler; she'll want to pitch right in. Then I'll need some help off and on all week to manage for the party."

She went down the walk, saying fervently to herself, "Now, if only Carrie Shoemaker doesn't try to put a finger in!"

From six to seven o'clock was supper time in Hennepin. That was fairly safe. At seven o'clock, with the dishes out of the way, Mrs. Wiersema posted herself at the front window. Presently the door across the way opened, and Rhoda appeared, with her two little brothers close behind. They shot ahead of her as she came slowly across the road. Just as she turned

The Cultivator Patterns

3720. A Smart Wrap—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size will require 4⅜ yards of 54 inch material. Price 10 cents.

3744. Child's Romper—Cut in 4 sizes: 2, 3, 4 and 5 years. A 4 year size will require 2¼ yards of 32 inch material. Price 10 cents.

3704. Girl's Under Garment—Cut in 6 sizes: 4, 6, 8, 10, 12 and 14 years. A 10 year size requires 2½ yards of 36 inch material. Price 10 cents.

3728-3725. Ladies' Costume—Waist 3728 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3725 cut in 7 sizes: 26, 28, 30, 32, 34, 36 and 38 inches waist measure. To make the dress for a 36 inch size will require 5½ yards of 38 inch material. The width of the snirt at the foot is about 2⅛ yards. TWO separate patterns; 10 cents FOR EACH pattern.

3437. Child's Dress—Cut in 4 sizes: 1, 2, 4 and 6 years. A 4 year size will require 2⅝ yards of 36 inch material. Price 10 cents.

3739. A Pretty Negligee—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size will require 5⅝ yards of 36 inch material. For sack length 4⅞ yards will be required. Price 10 cents.

3734. Girl's Dress—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size requires 4 yards of 40 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Therefore, we promise to deliver all patterns ordered within **TWO WEEKS;** we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

in at the gate, a large woman in an imposing black hat swept round the corner and approached aggressively on the other side of the street. With a chuckle of nervous relief, Mrs. Wiersema welcomed the three Lakins indoors.

Rhoda's face, with the bitterness in abeyance, had a plainly humorous cast.

"Who was that fat girl that I told I was going to leave?" she asked, with her dark eyes twinkling.

"Oh, that," said Mrs. Wiersema, with an answering flash. "That's Elvira Shoemaker. Her folks is leading citizens. You'll meet her and learn all about her at the party."

SOUTHERN RECIPES FOR CHICKEN AND GREEN CORN

By Mrs. I. S. Hill, Alta Loma

I enjoy the good recipes and helps found in the Cultivator. Mrs. G. H. B. asks for some of the old Southern ways of preparing and cooking chicken and green corn and I am glad to be able to send a few of the many I have.

Breaded Spring Chicken

Cut spring chicken into pieces, dip first into beaten egg, then in grated bread crumbs; season with minced parsley, pepper and salt; place in a pan, lay bits of butter over, add a little water, set in the oven and bake slowly; baste often. When done take up, pour a teacup of cream in the pan, stir in two tablespoons of grated bread crumbs and pour over the chicken.

Fried Chicken

Cut up young tender chicken, throw into salt water for half an hour. Wipe dry, roll in flour; drop several pieces in a frying pan nearly full of boiling lard; keep them moving constantly; fry brown, take up and put in more until all is fried, being sure to keep the pan nearly full of boiling lard (it is boiling when a blue smoke rises). When the chicken is removed sift in a tablespoon of flour, let brown slightly, add a little water, then a teacup of milk, stirring well until it thickens; season to taste with salt, pepper and parsley, if liked. Let boil up and serve in a gravy dish.

Dressed Chicken

Take large plump chicken, wipe well with a damp towel, put in kettle and cover with water. Place over a moderate fire and simmer gently until very tender. When done take the meat from the bones and cut in small pieces. Put the bones and scraps back into the kettle and let boil until the liquor is thick; strain and season with salt and pepper. Arrange chicken in a square tin mold, pour liquor over, place light weight on top and put in a cold place over night. When cold and firm turn out of mold, garnish with slices of lemon and parsley. Serve in thin slices.

Fried Chicken a la Creole

Cut chicken in pieces, dip in egg batter to which has been added two chopped tomatoes, one minced onion, with parsley, pepper and salt; fry brown in boiling fat and serve with tomato sauce.

Chicken Pie

Parboil one large fowl; line deep pie pan with pastry rolled thin, made as one would for biscuits, only a little shorter. Put in a layer of chicken, then a layer of pastry cut into strips an inch wide and two inches long. (These are called dumplings.) Next a layer of chicken and so on until all the chicken is in. Now cover with the pastry rolled thin. Cut two or three slits in the middle, pour in two cups of the water in which the chicken was boiled, having stirred in the latter a little butter, pepper and salt to taste. When pie is half done, replenish with more of the water. Add a pint of oysters if liked.

Stewed Corn

Eight ears of corn sliced from the ear in half grains, then scrape ear thoroughly. Put into stewpan and cook slowly, putting in the seasoning one teaspoon butter, salt and pepper to taste, just as it is ready to serve.

Corn Fritters

Stir into two well beaten eggs half a teacup of cracker crumbs, then one of boiled corn; mix thoroughly, make into small cakes and fry in hot fat. Place in colander or on brown paper.

Green Corn Cakes

One pint of corn, three eggs, butter size of a walnut, one tablespoon flour, a little milk and salt, drop with a spoon and fry brown.

HOUSEHOLD QUERIES

Cactus Syrup

(In answer to subscriber, Bonsall)—Take large pan, sharp knife and fork. Cut fruits from bush with fork and knife. Cut in halves on board and with teaspoon take out centers and put in double cooker. Boil till very soft; drain through jelly bag, measure, add equal parts juice and sugar and cook till thick enough, when cooled. Also fine for candies.—A. C. B., Watsonville.

Fried Chicken

(In answer to Mrs. G. H. B.)—Dress chicken and cut into pieces at joints; wash thoroughly, drain, roll in flour. Have half butter, half lard heated and brown slowly, turning often, adding salt, pepper and a little sage. When well browned add a cup of water and steam, adding a little more as needed till tender. Take up, add 1 cup thin cream and thicken gravy.—A. C. B., Watsonville.

Alum for Bedbugs

If the subscriber asking how to get rid of bedbugs will use hot alum water it will do the work. Take a big handful of alum to a 10 quart pail of hot water. Stir until dissolved and then go over beds and cracks in the floor, about the edges of all windows and doors with a broom dipped frequently in the hot alum water. A second application in three or four days is all I've ever had to use, but if necessary I'd repeat until no more were seen. I've used this in very severe cases and never knew it to fail. It also has the advantage of simplicity and there is no danger. Of course in old buildings with broken walls greater care has to be taken as the bugs are often hidden where they can not be reached. However an old hotel man gave this remedy and said that whenever a bug touched the line of alum it died.—Subscriber, Fresno.

Vinegar Bees

In the August 27 Cultivator I see Subscriber, Riverside, asked about vinegar bees. I do not know what the bees are made of, but in the east I made a great deal of vinegar from them and had just as good vinegar as any one would want and much too strong for lots of uses; it keeps well too. Some say it is not good for pickles but I had no trouble with it, and would like to get some more bees. To a small handful of the bees I used one quart of lukewarm water, a tablespoon of sugar and a tablespoon of molasses. I let it stand in the sunshine or a warm place for eight days, giving it a teaspoon of sugar every other day, then poured the liquid into a jug or jar, and started another quart with the bees. If they are not kept fed they will not work, and it is interesting to see them work. I like the Household Department very much and have tried several of the recipes and had good luck with them. We have had the Cultivator but a short time.—Subscriber, Las Plumas.

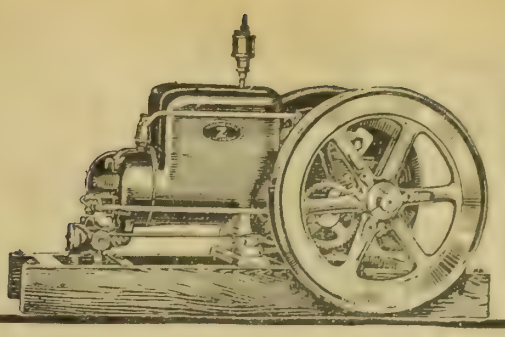
Crabapple Recipes

Here are some recipes for crabapples asked for in the Cultivator of August 20.

Crabapple Preserves — Select perfect, well colored crabapples, wash thoroughly and remove blossom ends, leaving stems and skins. Place apples in heavy boiling syrup and stew gently until well done. Lift out of the syrup and put into jars. Unless the syrup is very thick boil longer until it becomes like jelly. Then fill jars and seal at once.

Canned Crabapples—Take 3 quarts apples, 3 cups sugar, 1 quart water. Boil sugar and water until it makes a thin syrup. Add fruit and cook gently until tender. It will take from 20 to 50 minutes according to kind of apple.

Pickled Crabapples—Put 2 quarts vinegar and 3 quarts light brown sugar into kettle with a spice bag containing tablespoon whole cloves and quarter ounce of cinnamon. Wash and cut



Helping Farm Women

AN Illinois dealer said recently, "One big reason why the farmers around here like the "Z" Engine best is because their women folks can easily start it and look after it." And it's the farm wife who usually looks after the churning, washing, cream separating, pumping and such work. "Z" Engines do start easily—a natural result of the way the "Z" is built. The accurately finished piston with its expanding rings makes a perfect leak proof fit in the polished bore of the cylinder. The right mixture at the right pressure is ready for the spark even at the low speed at which the engine is cranked. This "piston fit" which makes for easy starting also assures highest fuel economy and full power at all times. This is one of the many reasons why the "Z" will always be the farmer's best buy.

You think you are taking a vacation, but generally it's the vacation that's "taking" you.

into halves or else leave whole a peck of ripe crabapples and cook in syrup. When done remove into jars and pour boiling syrup over them and seal jars at once.—Mrs. Peter Freyman, Del Rey.

Canning Pears

Seeing an inquiry about canning pears in your columns I am sending a hint I received from a Canadian friend. Estimate your quarts of pears and add one tablespoon vinegar for each quart to your syrup. These should stand a few weeks to be at their best. That is not enough vinegar to taste but it brings out the flavor of the pears and is a wonderful improvement in the taste besides making them keep better.—Allie Weems, Glenn.

Jerky Recipes

Can you tell me any ways of using jerky?—Subscriber, Glenn.

Can our readers answer this question?

HINTS FROM HOUSEKEEPERS

Candied Figs

These are different from any candied figs we ever saw or tasted—and the best ever. Samples brought in to the Cultivator office aroused much enthusiasm and invariably brought from the lucky tasters request for the recipe. The figs are very tender, clear amber in color and jelly like in consistency, the seeds are not hard and barely noticeable, one gets a real taste of the fresh fiig. Here are the directions—and they are very simple:

Slit skins, soak figs in salt water 6 hours, drain thoroughly, rinse if very salty. Make syrup in proportion of 1 cup sugar to 1 cup water to 1 pound fruit. Cook figs in this syrup 1 hour, handling gently and boiling gently so as not to break the skins. Don't stir. Let stand over night and cook another hour. Take figs out of syrup, spread on platters or waxed paper and let drain off and dry for two days. The usual directions call for drying in the sun for a longer time, but these soft figs are vastly more attractive to most palates. Also it was found that it was better not to dry in the sun as this made them too hard. Roll in granulated sugar.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Tenant Left

I leased a farm to a party for a number of years. He was to pay running expenses, develop a portion of the farm, and give me one-half of the income. After he had been there for some time, during which he had neglected to plant ten acres of corn as agreed or pay power bills and neglected the trees and vines on the place, he left, promising to return in three days. Several weeks have elapsed and no one knows where he is. He left household goods and clothing. What can I do if he does not return? Can the household goods be held for damages? They have very little money value.—Subscriber, Tulare.

Presuming that the lease is in the usual forms, the landlord reserves the right of re-entry when the terms and conditions of the lease are broken. The re-entry in this case can be peaceably effected, so there is apparently no reason for taking legal proceedings unless the lease is recorded and you desire to clear the record of the encumbrance. In such case, where waste is imminent, it would undoubtedly be your duty to re-enter and take proper care of the property. You would not be required to return possession of your property to the tenant, other than through operation of law in an action brought by him, and it would seem that you would have very good grounds for successfully defending such action. As to the property left by him, it must be understood that household goods and clothing are usually exempt from execution in the event of any action brought to sell them. This exemption is awarded upon affidavit filed by the judgment debtor. Apparently, in this case, you do not desire to take action. You certainly could not sequester these goods simply through personal claim without order of court. Another means is presented, however. By reason of the unlawful leaving of the premises and the necessity of the re-entry of the landlord, it would probably be held true that the goods would be considered deposited with the landlord, in which case, you would have a claim for reasonable compensation for their storage for a reasonable length of time. You may determine this deposit by reasonable notice to the depositary. Such notice may be made by registered mail, addressed to the tenant at the postoffice address of the ranch or by publication in the paper. In order to carry out the lien for such deposit, you are entitled to sell the property within a reasonable time after the giving of the notice terminating the deposit. In order to effect such sale you should give at least ten days' previous notice, by advertisement in the newspaper published in the county, of the time and place of the sale and the amount, which should be reasonable charge for storage of the goods. The property may then be sold by you at public auction and the proceeds discharge the lien of the cost of keeping and selling the property and the remainder, if any, deposited in a bank to the credit of the tenant.

Torrens Title

A, B, C, and D own land in Illinois registered under the Torrens system. B, C and D wish to convey their undivided interest to E. What is the proper form of deed?—Subscriber, Santa Ana.

In many instances the Torrens act provides the form of conveyance and the manner in which the conveyance shall be made. However, it is certain that any such conveyance should read to the effect that B, C and D convey to E their undivided three-fourths interest in the described property. Any other form of conveyance would probably lead to difficulty.

Personal Property Tax

Are notes, judgments, or other personal property due a resident of California from parties in Pennsylvania taxable there or here?—Subscriber, Terra Bella.

Personal property always follows the domicile of the owner and is taxable in California, not in Pennsylvania.

Walnuts Overhang Line

An adjacent owner claims the right to harvest walnuts on my trees which overhang his line from seven to ten feet. The trees are planted some seventeen feet from the line. I have received an opinion that this claim is not correct.—Subscriber, Fullerton.

This has long been a vexed question. Decisions may be found directly contrary to one another in various states, some holding that the owner of the tree is not only entitled to all fruit overhanging the land of the adjoining owner, but that he may hold such adjoining owner for larceny if he picks up fruit on his own land. Others hold that inasmuch as the ancient rule of the common law is that a land owner possesses absolute property in his land, not only on the surface, but to the center of the earth and to the furthest points of atmosphere above his land, that he thereby owns fruit or branches which are permitted to overhang and is entitled to harvest such fruit or branches. The case has never been squarely decided in this state. The only decision bearing upon the case may indeed be distinguished by reason of the fact that it may be held that what the court said was not necessary to the decision. In the absence of any definite decision in this state, however, the writer has based his opinion upon the wording of the decision in the supreme court in the case of Grandona vs. Lovedal: "The trees and the overhanging branches insofar as they were on or over his land belong to the plaintiff and he could cut them or trim them at his pleasure. This being so, we do not see how the fact that the trees had grown so that a small part of them was on plaintiff's land could give him any cause of action. It is further specified that the decision was contrary to the evidence, for the reason that defendant maintained the trees for the purpose of supplying himself with fuel and hop poles and thereby using plaintiff's land for his own profit and advantage. The fuel and hop poles growing over plaintiff's land were his, and could have been claimed by him as against the defendant." In the absence of any direct decision, it thus seems that it is necessary to hold that overhanging branches and the fruit thereof are the property of the party who owns the land underneath and not of the owner of the tree from which they grow.

Rhubarb and Berry Specialist, Pasadena, California.

San Fernando Fair

The San Fernando Valley towns will open their second annual fair next Monday morning, September 19, at San Fernando. This year's fair has absorbed the Los Angeles livestock show and the Los Angeles poultry show and, in addition will stage a horse show. The latter is styled "The Society $1,000-A-Night Horse Show." This name applies, for the reason that $1,000 will be divided in prizes each of the six nights of the fair. Over 200 horses have been entered and the management has constructed a great arena especially for this event and for the accommodation of the livestock show. Col. McClure of the government remount station will be present with a carload of army horses. Los Angeles, Hollywood, Pasadena, Beverly Hills, Santa Barbara, San Francisco and Oakland will all be represented, and entries have come in from as far north as Grant's Pass, Oregon. The latest entries to arrive are from E. F. Hanlon, Kentucky Riding Academy, Pasadena; Jack Holt, with "Lady Barbara;" F. W. Matthiessen, Triumfo, Chemawa Park polo stables, Riverside; and Thos. Magnon of Riverside.

The livestock show will bring out some 900 animals. A partial list of the entrants includes such well known breeders as A. B. Buell, Carpinteria, with Hampshires; F. F. Peabody, Santa Barbara with Aberdeen Angus; D. M. Longyear, Bishop, with his famous coach horse "Raven;" Ferdinand R. Bain, Jerseys; Paul Bros, Perris, Percherons and Berkshires; D. A. Russell, Durocs; Wessels & Mahoney, Windmere Farm, Chino, Guernseys; Rival J. Hawkins, Pasadena, Duroc Jerseys; Herbert J. McDade, jr., Pasadena, Holsteins; A. B. Austin, Van Nuys, Durocs; Josh L. Wilson, Lamanda Park, Hampshires; A. L. Ludwig, La Mirada, Duroc-Jerseys; Eastman Rancho, San Fernando, Poland Chinas; Chester T. Johns, Ontario, Berkshires; Adohr Stock Farms, Van Nuys, Guernseys; Robert. N. Clapp, Nuevo, Holsteins; Carl Ray's Ranch, Lankershim, Holsteins and Jerseys; Fred Hartsook Rancho, Lankershim, Holsteins and Toggenbergs; Santa Monica Dairy Company, Holsteins; Maxwell Farms, Holsteins; Billy Mong's "Your Duroc Farm," Whittier, Durocs.

E. J. Sturgis, superintendent of Hartsook's Ranch, is in charge of the division of goats for the fair and he says that he is litterally swamped with goats.

Another feature which has passed all expectations is the poultry show. As this is the only A. P. A. show thus far announced for the state for 1921, it is attracting wide interest and also from the fact that the cash awards total $3,000. E. I. Hammond of Riverside is in charge of the poultry.

A complete power farming exhibit with a working tractor demonstration will interest thousands of visitors. Four new models of tractors that have never before been seen on a demonstration field will be the Model F. Cletrac, the Tioga, the Wizard and the Gladiator. All of these will demonstrate their abilities at San Fernando next week.

A Competitor for the Ribbons

Inspiration of Edgemoor Farm, junior bull of Adohr Stock Farm, 29 months old, weighs 1,900 lbs. and will be shown this year at Los Angeles County Fair at San Fernando, September 19 to 24. He is a son of Imported Donnington Goldie 5th, champion A. R. cow at National Dairy Show at Chicago, 1920, and a grandson of Imported Itchen May King.

Agricultural, horticultural and industrial exhibits will have their places, and the women of the valley towns have thoroughly organized all the culinary, needlework and art exhibits and will in addition hold a modern scientific baby show.

A fair of this size would never be complete without dozens of amusement features for the fun loving, and the fair management has prepared a splendid midway where these events will be held. Two bands will be present day and night and a special dance floor has been constructed for the American Legion nightly dances.

THE SOUTHERN CALIFORNIA FAIR

The Southern California fair at Riverside, October 11-16, will show exhibits from Los Angeles, Fresno, Kings, Orange, Imperial and San Bernardino Counties. Riverside does not enter into competition for the county feature prize. The exhibits of the U S. department of agriculture and the state agricultural department will be two of the big features. Lectures and demonstrations will be of the greatest interest to the public. The indications now are that no less than 50 pig clubs will have displays. There will be a horse show, goat show, poultry show, dog show, in fact about every kind of show imaginable. And to complete the show, the five days of racing will bring out some of the best horses appearing at any fair in the state.

MAKING READY FOR VENTURA FAIR

Activity is in the air at Seaside Park, Ventura. Everything is in full swing preparatory to the Ventura fair October 5-9. Never before has there been such enthusiasm for a fair in Ventura as is shown this year. The agricultural and livestock departments will contain more exhibits than ever before. Hundreds of the finest Holsteins, Jerseys, Ayrshires, Guernseys, Herefords, Arabians, Clydes, Percherons and Belgians will be on exhibition. Berylwood Stock Farm's record milk producing Holstein will be on display. The California Rhode Island Red show, the National Swiss Mondaine pigeon show, a horse show, a wild west shown daily and some other features.

SHARPLES SEPARATOR SERVICE

We carry complete replacement parts for all Sharples Models for the convenience of Sharples patrons. We have an expert Sharples service man ready to go anywhere in our territory.

If you have an old Sharples Separator, write or come and see us. We will give you credit for it on the purchase of a new one. **Dealers in every county...** Free Sharples Booklet, "Velvet for Dairymen," sent on request.

SHARPLES

SUCTION FEED CREAM SEPARATORS

GET ALL THE CREAM

Dairy experts agree that in a four cow dairy, the addition of a good centrifugal cream separator is equivalent to adding another cow because the separator gets more cream from the milk of four cows than can otherwise be gotten from five.

Scientific investigation proves that from 10 to 40 pounds of butter per cow per year is lost in skimming by gravity. Sharples Separators soon pay for themselves. They are the only cream separators equipped with the patented "suction feed". This is controlled by the speed of the bowl. No matter whether you turn fast or slow the SHARPLES SKIMS CLEAN.

The following table of three actual tests with a Sharples Suction-feed cream separator makes the Sharples superiority clear:

Speed of Crank	Skim Milk Test	Cream Test
35	.01 (clean)	34
45	.01 (clean)	34
55	.01 (clean)	34
Different Speeds	Always skims clean	Cream doesn't change

When you raise the speed from 35 revolutions per minute to 55 you double the capacity of the separator—it skims twice as fast. Raising the speed in the test made the separator run the milk through faster but did not change the thickness of the cream. You do not have to run the SHARPLES at any set speed to get a clean skim.

YOUR DAIRY WILL MAKE MORE MONEY FOR YOU IF YOU OPERATE A SHARPLES. WE WILL SHOW THE COMPLETE LINE AT THE SAN FERNANDO FAIR SEPT. 19 to 24 AND WILL BE PREPARED TO TAKE ORDERS FOR THEM AND ALL OUR STANDARD LINES ON EASY PAYMENTS.

LIVESTOCK THE BIG FEATURE AT SACRAMENTO

(Continued from Page 281.)

The dairy cattle show in all departments, save the Holstein, was declared the best yet seen at Sacramento. The Guernsey show was especially strong. The Ayrshire exhibit was probably the best yet seen in this state, and the Jersey show was in every way up to standard. The Holstein classes suffered considerably because a number of the old timers did not bring out herds, but that situation was somewhat compensated for by the appearance of a goodly number of new men who came forward with a class of cattle entirely creditable to the breed.

The swine show was a real surprise to all. Not so many hogs of the leading breed were in the pens as last year but, taken as a whole, the show was better balanced and decidedly more quality was noted throughout. Nearly every exhibitor reported better sales than for several years past, due, no doubt, to the wide margin between barley and hogs. Eastern judges and representatives of the breed associations expressed genuine approval of the stamp of hogs now being produced in California.

The sheep show was considered up to the usual standard, which is always good, but in no way representative of the importance of the industry in this state.

The draft horse show lacked the quality and numbers of former years owing to the fact that several of the leading stables, notably the Blackhawk Ranch, were not entered. There are a lot of good draft horses being produced in California, but not many were on hand at the state fair. Exhibitors stated that the demand for horses, while still light, is showing much greater strength than for many years.

A new record was established when the milk goat breeders staged the best show ever seen at the state fair. The quality was declared to be equal to the best in the West and the numbers sufficient to require two new barns.

For the most part the awards were placed by men of known ability and the exhibitors generally were satisfied with the ratings or were such good sports as to take their defeats gamely.

BEEF CATTLE

The Shorthorns

Never in California was such a splendid showing of Shorthorns made. It was easily the top showing of the West, and class after class came forward to establish new records and to truly astonish those who had failed to keep in touch with the activities of the breed. Every available stall was occupied, sometimes exhibitors doubled up, and finally a new barn had to be erected to care for the overflow. The show not only established records as to numbers but the quality was such as to be a distinct credit to the breed. Capt. T. E. Robson of Canada made the awards:

Five aged bulls led off the day's showing, and five good bulls they were, most any of which might have been a winner a few years back. The massive dark roan imported bull, Corston Masher, appeared an easy top, his bulk and thickness and good front carrying him above last year's champion, Imp. Scottish Lord shown by Glide. The latter bull has done well since last year. He is thicker, deeper and very smooth. The third bull was of good type, well balanced fore and aft but lacked the scale of the two above him. Pacheco was fourth and Miller fifth.

Only three two year olds were out. The judge preferred the more stylish and upstanding bull of Glide's to the deeper, thicker rich red shown by Miller. The second bull carries a lot of mellow flesh and handles about as well as any red bull ever did. He was a trifle flat in his rib and hardly so strong on top. Count's Baron is a bull of considerable style but hardly so smooth and level as the first two.

The five senior yearling yielded to the attractive white shown by Pacheco whose style, quality, levelness and balanced fore and rear carried him through to final honors. He was junior champion at last year's show. Just below him was a roan from the Caledonia herd that lacked but a bit of smoothness at his tail to make trouble. His general type is not to be criticised. Fronted with a beautiful head, capital in his crops and excellent in his flank and quarters he was an easy second over the red and white shown by Glide. Elberg was represented with a light and mellow roan with a lot of scale and the sort of bone that western men like but he was off a bit at the tail. The fifth bull lacked somewhat in condition and was light behind.

The junior yearlings were topped by a flashy roan son of Caledonia that boasted a real head, carried with style, excellent quarters and a splendid flank. He was not so strong in the heart as the blocky and sappy calf from the Straloch herd that stood second and whose depth, thickness and quality made him friends. Third place fell to a calf with more scale than the others but a little plain at the tail head. Dibblee took the next two places with white calves, the last place going to a calf that lacked a little in size but that was better balanced than the fourth.

The eight senior calves made a strong show. Two Caledonia youngsters were to the fore, the top calf being one of the most attractive seen in a California show ring. He is a youngster of rare type and quality, quite level in his lines and fleshed very smoothly. He was particularly good at his tail and down into his quarters but was hardly as large as his stable mate nor was he as good in his heart. The third calf took his place by virtue of his depth and thickness over the smooth fellow from the Glide herd. Dibblee was fifth with a nicely balanced calf that lacked size to get higher.

The juniors were headed by a highly attractive youngster from the Straloch herd that was a bull from his burly head to his deep and thick quarters. Caledonia was second with a younger calf of great smoothness and quality but lacking as attractive front as the winner. The next three calves took their rating rather naturally.

The aged cows showing with a calf at foot furnished no competition to the famous Little Sweetheart from the Glide herd. For the third time this remarkable cow downed all competition and calmly awaited the awarding of the purple. Little Sweetheart is a remarkable cow. After four years of campaigning all over the coast and as far east as Chicago she appears about as attractive as ever. She may be a little plainer at the shoulder but she looks a bit neater at the tail and still retains her wonderful thickness, quality and rare character. The second place went to a very thick fleshed matron from Pacheco who easily stood above a thin cow from the Nevada herd.

But three aged dry cows yielded an easy top in the splendid roan from the Caledonia herd. This cow was quite outstanding with her great width and depth; her levelness and thickness; her quality and smoothness. She is a great cow that needs but a more attractive horn to carry her a long way. Glide was second and the Nevada herd third.

The two year olds fell in behind the good white from Pacheco and the same herd furnished the second. Glide was third with a two year old with quality that appeared a bit upstanding. Murphy was fourth.

The ten senior yearlings was not an especially strong class after the tops were taken out. Elberg won with a good handling daughter of Crescent Dale over a white from Pacheco that was perhaps a better type but not so good at the shoulder. Caledonia was in third with a very compact little red with a beautiful front and nice balance but entirely too small and that would have looked better either at the top or at the bottom. Straloch held the next two places in an easy manner with a roan and a red that bid fair to give a better account of themselves in the future.

The junior yearlings, 14 of them, had the honor of constituting the largest class of Shorthorns ever shown in California. A dark roan from the Nevada herd found early favor with the judge who liked her general lines and good front. Pacheco was second with a roan that handled well but was a trifle light at the shoulder. Caledonia was third and fourth with a roan and white, the latter of which had a good many friends for top rat-

ing. Dibblee was fifth with a roan that was quite smooth but with none too strong a top.

The honor that went with the junior yearlings was but short held for 18 seniors stepped into the ring—the largest class ever in a California ring. Carruthers had an acceptable top in his white of splendid type. This little lady needs only a mellower hide to make her bad medicine among the younger things. Caledonia was second with a red of great quality and smoothness and third with a white of ample scale and nice lines. Straloch was fourth with a roan and a Nevada heifer stood next and above a white from the Miller herd.

The nine juniors made a strong lot and developed one of the sensations of the show in the winner, a little white lady from the Caledonia herd that was generally acclaimed to be the best young thing ever seen in a western show ring and in every way good enough to hold her own in any show in the country. She was later made junior champion with the approval of all. Glide was in second with a nice calf while Pacheco was third and Carruthers fourth.

Generally speaking the judging up to the group classes was satisfactory to exhibitors and spectators but in the younger groups—especially in the get of sire class there was scarcely a man about the ring that agreed with the judge when he left the two Caledonia entries third and fourth. These entries had been expected by all to win.

When the groups were being shown there was hardly room for the judge after the cattle were in the ring.

The awards follow:

Exhibitors: Caledonia Farms, West Sacramento; W. M. Carruthers, Live Oak; Thos. B. Dibblee, Lompoc; Edinger-Johnston Co., Hood; Henry M. Elberg, Woodland; T. S. Glide, Davis; Thomas T. Miller, Hollister; H. L. and E. H. Murphy, Perkins; Pacheco Cattle Co., Hollister; Straloch Farm, Woodland; Howard Vaughn, Dixon; Warm Creek Land and Livestock Co., Wells, Nevada.

Aged bull—1, Warm Creek on Corston Masher (Imp). 2, Glide on Scottish Lord. 3, Vaughn on Right Sort Jr. 4, Pacheco on Dalmeny Count.

Two year old — 1, Glide on Cheerful Count. 2, Miller on Milmar Matchless. 3, Carruthers on **Count's Baron.**

Senior yearling—1, Pacheco on Pacheco Lad 215th. 2, Caledonia on Pine Grove King 21st. 3, Glide on King's Count. 4, Elberg on Roan Champion.

Junior yearling—1, Caledonia on Caledonia King 2nd. 2, Straloch on Straloch Adjutant. 3, Elberg on Missie's Parkdale. 4, Dibblee on Star of Cluny. 5, Dibblee on Knight Avon. 6, Warm Creek on Victoria's Gallant.

Senior calf—1, Caledonia on The Caledonia. 2, Caledonia on Caledonia Marshall. 3, Elberg on Rosie's Champion. 4, Glide on Hillcrest Lord. 5, Dibblee on Royal Crescent. 6, Miller on Stamp of Milmar.

Junior calf—1, Straloch on Helsman. 2, Caledonia on Matchless King. 3, Edinger-Johnston Co. 4, Warm Creek on Missie's Masher. 5, Warm Creek on Missie's Masher 2nd.

Aged cow and calf—1, Glide on Little Sweetheart and calf. 2, Pacheco on Pacheco Lass 118th. 3, Warm Creek on Hope (Imp.) and calf.

Aged cow—1, Caledonia on Glen Bessie 3rd. 2, Glide on Village Lassie. 3, Warm Creek on Sweet Rose.

Two year old—1, Pacheco on White Pacheco. 2, Pacheco on Pacheco Doris. 3, Glide on Village Rose. 4, Murphy on California Orange.

Senior yearling—1, Elberg on Crescent Lady. 2, Pacheco on Sultans Dale. 3, Caledonia on King's Honour. 4, Straloch on Oakdale Beauty.

Senior yearling—1, Warm Creek on Nevada Hope. 2, Pacheco on Pacheco Doris 2nd. 3. Caledonia on Glenbrook's Memory 43rd. 4, Caledonia on Sultan's Bessie. 5, Dibblee on Princess Royal. 6, Straloch on Silver Rosebud.

Senior calf—1, Carruthers on Lady Rubert 2nd. 2, Caledonia on Caledonia Queen. 3, Caledonia on Caledonia Bud. 4, Straloch on Straloch Maria. 5, Warm Creek on Sweet Golden Rose. 6, Miller on White Milmar.

Junior calf—1, Caledonia on Caledonia Mischief 2nd. 2, Glide on Village Rose 2nd. 3, Pacheco on Matchy's Lass. 4, Carruthers on Roan Lady 2nd. 5, Glide on Village Lassie 2nd. 6, Carruthers on Roan Lady 2nd.

Senior champion bull — Imp. Corston Masher. Junior champion—Pacheco Lad 215th. Grand champion — Pacheco Lad 215th. Senior champion female—Little Sweetheart. Junior champion—Caledonia Mischief 2nd. Grand champion — Little Sweetheart.

Aged herd—1, Glide. 2, Pacheco.

Breeders' young herd—1, Pacheco. 2, Caledonia. 3, Glide. 4, Dibblee.

Calf herd—1, Caledonia. 2, Caledonia. 3, Glide. 4, Dibblee.

Get of sire—1, Glide. 2, Pacheco. 3, Caledonia. 4, Caledonia.

Produce of dam—1, Caledonia. 2, Pacheco. 3, Dibblee. 4, Pacheco.

The Herefords

While taking second place to the Shorthorns in point of numbers the Herefords boasted as much quality all down the line as their contemporaries in improving the quality of California beef. The showing this year was but a reflection of the fine progress being made by the breeders of the Whitefaces.

E. A. Noyes & Son, making their first show, had an easy win in the aged bull class with Pacific Corker, a bull of fine type, carrying an excellent and smooth covering of deep mellow flesh. This fellow with his attractive head and horn and great heart only needed to carry his width better back to his tail-head and down into his quarters to have walked through to top honors. At that, he had many admirers. Jacks went into second place with a son of Woodford over a good kind of poll shown by Emmons.

Five two year olds were headed by The Peer, from the Bunting herd. This bull is of the right sort throughout—an excellent front, well covered shoulders, strong crops and girth, even width from front to rear and carried down into his quarters to make a nice balance, needed considerable more condition to carry him past the senior championship that he won. Briggs had an easy second with Lincoln Domino over Yolo Fairfax shown by H. H. Gable for W. D. Duke. The Bar N herd came fourth with a very growthy fellow that lacked condition to make him show to advantage. Barngrover had the fifth place.

Gable furnished the top in the senior yearlings with Louis Fairfax. Baldwin was second with a bull that showed rather sore but was right in his place above the Jacks entry.

The junior and grand champion of the show was found among the junior yearlings in the Cazier entry, Blanchard 1st. This youngster, fitted to perfection, is fronted with a head full of character and style. He is nicely covered throughout and is especially attractive in his rear set-up—few bulls being smoother at the tail or better in the quarters. He could show a bit more girth at the heart. Baldwin was in second with a calf just 20 days too old to show as a senior, but despite this handicap his type and quality and remarkable character about his superb head was enough to land him second. Howard, also making his first show, was third with a fair stamp. Cazier and Noyes filled the other places.

The five senior calves were not especially strong. Cazier had the two outstanding calves and John A. Bunting, Jr., the youngest Hereford exhibitor in the West, was third with a calf of more scale but lacking somewhat in condition. Jacks was fourth with a little fellow over a very plain and poorly fitted calf.

The seven juniors were led by a nicely balanced calf from the Bunting herd that was not so thick as the Briggs calf but was stronger in the heart and crops. Cazier was third and Briggs fourth. Emmons was fifth with a poll.

The four aged cows acknowledged last year's champion, Bocaldo Beauty, the outstanding winner and she went through with little opposition to the same rating this year. This cow is a superior type from any angle and like her Shorthorn contemporary could hold her own in any show. She has grown since last year and though she may not handle quite so well, she is outstanding in any company. Noyes was second with a massive, thick-loined cow that needs width in her quarters. Gable was third and fourth with two good sorts that were simply in too fast company.

The top pair of two year olds furnished real competition. Howard won with a desirable kind in every way whose sweet character and even lines found favor with the judge over Jacks' Ruth Domino that was a bit thicker and handled better and was smoother at the tail. They were two good ones. Jacks was also third and fifth and Briggs took fourth.

Cazier topped the senior yearlings in easy fashion with a heifer of splendid type and quality. Briggs was second with a good kind whose somewhat nicer front put her above the Baldwin entry of much the same type. Bunting was fourth over a rather upstanding but stylish heifer shown by Howard.

The eight junior yearlings made a strong class. The Nevada herd was out in front with two very attractive little ladies, either of which could have worn the blue. The judge, however, leaned to the one with more size. Briggs was third with a highly desirable kind. Beautifully fronted, quite level and well balanced throughout and very thick but handling a bit overdone. Had she handled better the story might have been different. Howard also had a good one that handled hard. Noyes was fifth with a nice fronted heifer that was hardly so smooth as the others.

The 12 senior heifers made up the largest class of the show. Cazier and Briggs went 50-50 on the top four places, the former taking first and second with daughters of Beau Blanchard 76th. The third calf was nice but small. Baldwin was fifth with a fair sort.

Dont Send a Penny

Rubber Boots

For Ranchers and Irrigation Work

$3.98

A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOR. Will stand all extremes of heat and cold and made to give extra long wear. Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. Mr. W. H. Dupee, Owner of Edgemoor Farm Santee, Cal., Will Offer

51 Registered Guernseys 51

41 Females—10 Bulls

AT PUBLIC AUCTION

Rhoades & Rhoades Sale Pavilion, Hynes, Cal.

Thursday, October 20, at 10 A.M.

In making this public sale offering Mr. Dupee is making an effort to help meet the very large demand for registered Guernseys in California, a demand that has been unsatisfied for several years because of the great scarcity of such animals available for purchase.

The 41 females in this sale are all heifers with their whole useful lives before them, and a very large percentage of them sell bred either to

MASTERPIECE OF EDGEMOOR, one of the very greatest young sires of the breed, he being sired by a son of Belladia, California's highest record Guernsey cow, and out of the highest record daughter of the great Ne Plus Ultra

or to

DEANIE'S MAROSE OF APPLETREE POINT, the undefeated young show bull that was first in the 1920 National Dairy Show and other major shows last year.

The 10 bulls are bred in most approved lines and include individuals of most attractive type, offering a selection for both breeders and dairymen.

Every animal positively guaranteed to be a breeder; every animal Tuberculin Tested and sold subject to 60 day retest.

TERMS OF SALE: Cash unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will make terms of one-third cash, balance in three, six, and nine months to responsible parties on approved notes.

Auctioneers: RHOADES & RHOADES Los Angeles

Management California Breeders Sales and Pedigree Co. C. L. Hughes, Sales Manager, Sacramento, Cal.

The junior heifers did not stage a strong showing.

Frank W. Van Natta made all the ratings in his usual efficient and expert manner.

The awards follow:

Exhibitors: H. A. Baldwin, Pleasanton; H. M. Barngrover, Taylorsville; William Briggs and Son, Dixon; John Bunting Jr., Mission San Jose; John H. Cazier and Sons Company, Wells, Nevada; W. D. Duke, Gazelle; G. W. Emmons, Danville; H. H. Gable, Esparto; C. S. Howard, Willets; L. C. Marshall, Vacaville; Mission Hereford Farm, Mission San Jose; E. A. Noyes & Son, Sutter.

Aged bull—1, Noyes on Pacific Corker. 2, Jacks on Woodford 34th. 3, Emmons on Junior Grove.

Two year olds—1, Mission on The Peer. 2, Briggs on Lincoln Domino. 3, Duke on Yolo Fairfax. 4, Noyes on Bar N King. 5, Barngrover on Beau Blanchard 94th.

Breeders' young herd—1, Cazier.

Calf herd—1, Cazier. 2, Cazier. 3, Mission. 4, Jacks.

Get of sire—1, Cazier. 2, Mission. 3, Noyes. 4, Jacks.

Produce of dam—1, Cazier. 2, Noyes. 3, Mission. 4, Gable. 5, Jacks.

Angus

James Marwick of Santa Barbara won practically everything in the Angus classes with individuals from his high class herd—mostly imported cattle.

But few steers were entered in the single classes. W. M. Carruthers won both single classes and the championship.

The Hammond Estate Co., Corning, had the winning carload—a load of big Shorthorns, well fatted.

DAIRY CATTLE

Guernseys

The Guernsey show was the largest ever held at the state fair and the quality was generally above the average.

The fight for first place was usually between A. B. Humphrey of Escalon and the Brant Rancho of Owensmouth and they divided the honors.

Humphrey's bull, Nobleman of Maple Hill, defeated Brant's bull, May King of Fern Ridge, the last year's grand champion, in the aged bull class and had clear sailing for senior and grand champion. Escalon Fancy Lad shown by Humphrey was junior champion and was sold to W. H. Dupee of Santee before he left the ring.

In the aged cows Brant's Sylvia of Frankland was first over the Leonard Estate cow and Brant's Princess of Meadowbrook who has often been grand champion at this show. She was later made senior and grand champion.

The Guernsey Cattle Club prize for the best cow in milk bred by the exhibitor was won by Humphrey.

The Leonard Estate of Grants Pass, Oregon, was present with a nice herd of females and was generally up in the money.

L. W. Wing made the awards which follow:

Exhibitors: Brant Rancho, Owensmouth; Calla Grove Farm, Manteca; Loring Farnam, Ojai; A. B. Humphrey, Escalon; Leonard Estate Company, Grants Pass, Oregon; James Marwick, Santa Barbara; Palo Alto Stock Ranch, Palo Alto; L. D. Smith, Hydesville.

Aged bull—1, Brant on Nobleman of Maple Hill. 2, Brant on May King of Fern Ridge. 3, Palo Alto on Argie's Prince. 3, Leonard on Nella Girl's Diamond of Pencoyd. 5, Smith on Mysie's Lady of Claremont.

Two year old — 1, Brant on Itchen Daisy's King of Revada. 2, Smith on Babe's Boy of Claremont.

Senior yearling—1, Smith on Claremont Renown.

Junior yearling—1, Brant on May Day of the Rancho. 2, Humphrey on Escalon Rex. 3, Farnam on Angus King of Hollow Hill Farm. 4, Smith on Claremont Don.

Senior bull calf—1, Humphrey on Escalon Fancy Lad. 2, Brant on Noble King of the Rancho. 3, Humphrey on Escalon Bopeep's Pride. 4, Humphrey on Escalon Bullion. 5, Smith on Claremont Chief.

Junior bull calf—1, Brant on Golden Glow of the Rancho. 2, Marwick on Rube Langdon of Hollow Hill Farm. 3, Humphrey on Escalon Itchen Prince. 4, Leonard on River Banks Bonny Jay. 5, Leonard on River Banks Jay Lyons.

Aged cow—1, Brant on Sylvia of Frankland. 2, Leonard on Red Lady of Sunnyside Farm. 3, Brant on Princess of Meadowbrook. 4, Humphrey on Golden Ann's Fairy. 5, Leonard on Red Lady of River Banks Farms.

Aged cow—1, Humphrey on Revada Lily Bell. 2, Brant on Little Queen of the Rancho. 3, Smith on Queen of Claremont.

Two year old—1, Humphrey on Escalon Lassie. 2, Brant on Elsie of the Rancho. 3, Leonard on Sunny Lady of River Banks Farm. 4, Smith on Mysie's Hope of Claremont 2nd.

Senior yearling—1, Humphrey on Mayhews Bonnie Lass. 2, Leonard on Imp. River Banks Valentine. 3, Brant on Jeannie of the Rancho. 4, Brant on Pet of the Rancho. 5, Humphrey on Pearl Souffle of Revada.

Junior yearling—1, Leonard on Imp. Osceola Misty Morn. 2, Brant on Felois Tungsten Priscilla. 3, Smith on Claremont Mollie. 4, Humphrey on Escalon Queen. 5, Smith on May of Claremont.

Senior heifer calf — 1, Humphrey on Escalon Pearl. 2, Leonard on Imp. Osceola Water Lily. 3, Brant on Fascination of the Rancho. 4, Humphrey on Escalon Marigold. 5, Brant on Melissa's Queen of the Rancho.

Junior heifer calf—1, Humphrey on Escalon Naomi. 2, Brant on Fenix of the Rancho. 3, Leonard on River Banks Nella Girl. 4, Brant on May King's Rosemary of the Rancho. 5, Humphrey on Escalon Phyllis.

Senior champion bull — Nobleman of Maple Hill. Junior champion—Escalon Fancy Lad.

Senior champion female — Sylvia of Frankland. Junior champion female—Escalon Naomi.

Grand champion bull — Nobleman of Maple Hill.

Grand champion female — Sylvia of Frankland.

Aged herd—1, Brant. 2, Humphrey. 3, Leonard.

Breeders' young herd — 1. Brant. 2, Humphrey. 3, Smith.

Calf herd—1, Humphrey. 2, Brant. 3, Smith.

Get of sire—1, Humphrey. 2, Humphrey. 3, Brant. 4, Smith.

Produce of dam—1, Brant. 2, Humphrey. 3, Leonard. 4, Smith.

Dairy herd 5 cows in milk—1, Brant.

Ayrshires

Exhibitors: Elkhorn Farm, Watsonville; Lathrop Bros., Grants Pass, Oregon; E. Wyndham, Redding.

Aged bull—1, Lathrop on Willowmoor Ben Hur 24th.

Two year old—1, Elkhorn on Elkhorn Masterpiece. 2, Wyndham on David of Shasta. 3, Wyndham on Prince Rupert of Grants Pass.

Junior yearling—1, Elkhorn on Elkhorn Pilot.

Senior calf—1, Elkhorn on Elkhorn Ben. 2, Wyndham on unnamed. 3, Lathrop on Sunny Brook Jim.

Junior calf — 1, Elkhorn on Elkhorn Rover. 2, Lathrop on Oregon. 3, Wyndham on Tanglewyld Duke of Ayres.

Aged cow — 1, Elkhorn on Highland Ithan. 2, Elkhorn on Polly Puss 3rd. 3, Wyndham on Aaggie of Darrock. 4, Wyndham on Tanglewyld Princess 2nd. 5, Lathrop, on Blossom of Sunny Brook.

Two year old—1, Lathrop on Blossom's Mickey of Sunny Brook.

Senior yearling—1, Elkhorn on Elkhorn Heathflower 2nd. 2, Elkhorn on Elkhorn Princess. 3, Lathrop on Ben's Lady of Sunny Brook. 4, Wyndham on Shasta's Dream. 5, Wyndham on Maid of Shasta.

Junior yearling—1, Elkhorn on Elkhorn Polly Puss. 2, Lathrop on Sunny Brook May.

Senior calf — 1, Elkhorn on Elkhorn Bonnie Queen. 2, Elkhorn on Elkhorn Bonnie Bell. 3, Wyndham on Darling of Shasta. 4, Lathrop on Blossom's Mollie of Sunny Brook. 5, Lathrop on Mickey's Lottie of Sunny Brook.

Junior calf — 1, Elkhorn on Elkhorn Thistledown. 2, Elkhorn on Elkhorn Blue Belle. 3, Lathrop on Judy. 4, Wyndham on Tanglewyld Princess 5th. 5, Lathrop on Flo.

Cow having official yearly record—1, Elkhorn on Pully Puss 3rd. 2, Elkhorn on Highland Ithan. 3, Lathrop on Blossom of Sunny Brook. 4, Wyndham on Aaggie of Darrock. 5, Lathrop on Blossom's Mickey of Sunny Brook.

Senior champion bull—Elkhorn Masterpiece. Junior champion bull — Elkhorn Pilot.

Senior champion cow—Highland Ithan. Junior champion cow — Elkhorn Bonnie Queen.

Grand champion bull—Elkhorn Pilot.

Grand champion cow—Highland Ithan.

Breeders' young herd—1, Elkhorn. 2, Wyndham. 3, Lathrop.

Calf herd—1, Elkhorn. 2, Lathrop.

Get of sire—1, Elkhorn. 2, Wyndham. 3, Lathrop.

Produce of dam—1, Elkhorn. 2, Elkhorn. 3, Lathrop. 4, Wyndham.

Dairy Shorthorns

Exhibitors: Alexander & Kellogg, Davis; J. D. Rowe & Sons, Davis; Thos. T. Harrison, Santa Rosa; W. T. Roberts, Penngrove.

Aged bull—1, Harrison on Count Tickford. 2, Alexander & Kellogg on Innisfail Favorite.

Junior yearling—1, Alexander & Kellogg on Innisfail Perfecter. 2, Alexander

& Kellogg on Innisfail Roan.
Senior bull—1, Alexander & Kellogg on Snow White. 2, Harrison on Santa Rosa Viscount. 3, Harrison on King Viscount.
Junior bull calf—1, Harrison on Count Crystal. 2, Harrison on Count Marshall. 3, Alexander & Kellogg on Snowdrop. 4, Alexander & Kellogg on unnamed.
Aged cow—1, Alexander & Kellogg on Bellevue Daisy. 2, Alexander & Kellogg on Princess Clay. 3, Alexander & Kellogg on Alma. 4, Harrison on Miss Utility.
Three year old—1, Harrison on Welfare's Belle. 2, Alexander & Kellogg on Innisfail Dairymaid.
Two year old—1, Harrison on Frantic Girl. 2, Alexander & Kellogg on Gipsy Girl. 3, Alexander & Kellogg on Valley Belle 6th.
Senior yearling heifer—1, Harrison on Lovely Perfection. 2, Alexander & Kellogg on Valley Belle 7th.
Junior yearling heifer—1, Roberts on Roan Bess. 2, Alexander & Kellogg on Innisfail Daisy 2nd.
Senior heifer calf—1, Alexander & Kellogg on Innisfail Betty. 2, Alexander & Kellogg on Innisfail Betty Jane.
Junior heifer calf — 1, Harrison on Santa Rosa Butterfly. 2, Harrison on Santa Rosa Pearl. 3, Alexander & Kellogg on Innisfail Evelyn. 4, Alexander & Kellogg on Innisfail Daisy 3rd.
Cow having official yearly record—1, Alexander & Kellogg on Bellevue Daisy. 2, Alexander & Kellogg on Princess Clay.
Senior champion bull—Count Tickford. Junior champion bull—Crystal Count.
Senior champion female — Bellevue Daisy. Junior champion female—Santa Rosa Butterfly.
Grand champion bull—Count Tickford. Reserve—Crystal Count.
Grand champion female — Bellevue Daisy. Reserve—Santa Rosa Butterfly.
Aged herd—1, Harrison. 2, Alexander & Kellogg.
Breeders' young herd—1, Alexander & Kellogg.
Calf herd—1, Alexander & Kellogg. 2, Alexander & Kellogg. 3, Alexander & Kellogg.
Produce of dam—1, Harrison. 2, Alexander & Kellogg. 3, Alexander & Kellogg. 4, Alexander & Kellogg.
Dairy herd—1, Alexander & Kellogg.

Ayrshires

The Ayrshire show comprised three herds with a total of 38 animals. This was a marked improvement over the showing of last year when only one herd was present.

Elkhorn Farm of Watsonville was the heaviest winner, taking all the championships as well as 14 firsts. The grand champion cow was Highland Ithan who was also grand champion at the fair when she was shown in 1919. The competition between this cow and her herd mate, Elkhorn Bonnie Queen, the junior champion, was exceedingly keen, for the highest honors. Judge Kildee's final remarks were: "A grand old cow against a most wonderful young thing."

The grand champion award in the male class gave Elkhorn Pilot the decision over his mate, Elkhorn Masterpiece.

The other herds showing were from Wyndham Ayrshire Farm of Redding and Lathrop Bros. of Grant's Pass, Oregon. Mr. Wyndham is one of the new breeders in the state and he has some fine foundation animals which he recently brought into this state from Canada.

This year considerable interest was shown in the breed and many interested spectators watched the award of the ribbons. All of which goes to show that the Ayrshire is becoming better known and more popular in California.

Jerseys

Jas. E. Thorp of Lockeford came loaded to the gunwales in the Jersey classes this year, and after the battle was over he had all the purples but one and the lion's share of the blues. Thorp had a wonderfully balanced herd, of excellent type and well fitted. M. Fortini of Orland who won practically everything last year was present with only six head but was in the money with all of these. Fortini won the two year old cow and junior champion bull classes and together with Guy Miller pushed Thorp to the limit in nearly all Jersey classes.

Thorp's great old cow, Salome of Mossdale, was grand champion and his aged bull, Jolly Senator Raleigh, was grand champion male.

L. W. Wing Jr. served as judge in place of E. W. Majors who was unable to officiate because of illness.

The awards follow:

Exhibitors: John Bruce, Galt; Austin Clark, Orland; Marguerite Conant, Modesto; Anna May Conoly, Orland; A. Cruikshanks, Sacramento; Ernest Forbs, Orland; M. Fortini, Orland; Wm. Gibson, Galt; E. E. Greenough, Merced; S. Leigh Howard, Merced; Charley Krause, Orland; Max Krause, Orland; Guy H. Miller, Modesto; Harold Mordecai, Petaluma; Norman Neal, Petaluma; Newton M. Peterson, Sebastopol; Oscar B. Peterson, Sebastopol; J. H. Sawyer, Galt; Mae A. Sawyer, Galt; Seavy & Son, Galt; Mildred Seavy, Galt; P. N. Smith, Florin; J. E. Thorp, Lockeford; H. G. Van Pelt, Waterloo, Iowa (by J. H. Sawyer, Galt).

Aged bull—1, Thorp on Jolly Senator Raleigh. 2, Miller on Jap's Perfection Owl.

Two year olds—1, Thorp on Biddy's King of Mossdale.

Senior yearling—1, Thorp on Fairy Boy of Mossdale. 2, Van Pelt on Financial Corrector.

Junior yearling — 1, Fortini on Sir Lancelot of Tintagel. 2, Miller on Ramona's Perfection Owl. 3, Thorp on King's Fresno Buttercup King of L. 4, Max Krause on Noble Dulcet King. 5, Miller on Jap's Foxy Owl.

Senior calf—1, Fortini on King Mark of Tintagel. 2, Forbs on Lora's Undulata. 3, Fortini on Orlando of Tintagel. 4, Thorp on King of Mossdale Jr. 5, Cruickshanks on Golden Lucy's Belleview Dick.

Junior calf—Thorp on King's Tip of Mossdale. 2, Seavy and Son on Blonde Beauty's King. 3, Miller on Lucilles Owl. 4, Sawyer on unnamed.

Aged cows—1, Thorp on Salome of Mossdale. 2, Sawyer on Valet's Fresno Lemola of L. 3, Fortini on Silverine Pearl's Duchess. 4, Thorp on Nomie of Venadera. 5, Miller on Gladys of Venadera.

Three year olds—1, Thorp on Bonnie of Mossdale. 2, Thorp on Fair Salome of Mossdale. 3, Miller on Ada of Venadera. 4, Thorp on Goldie's Nehalem Cowslip.

Two year olds—1, Fortini on Jewel of Tintagel. 2, Thorp on Oxford Nora's Daisy. 3, Thorp on Gladys of Mossdale. 4, Miller on Diana of Venadera. 5, Miller on Laurie of Venadera.

Senior yearling heifer—1, Sawyer on Goldie's Dame Onota. 2, Thorp on Girlie of Mossdale. 3, Thorp on Jolly Emerita of Mossdale. 4, Thorp on Sonny's Blossom of Mossdale. 5, Henry on Violet's Betty Fox.

Junior yearling heifer—1, Thorp on Ramona of Mossdale. 2, Charley Kruse on Pearl of Willow Wood. 3, Irvin Hayworth on Verna of Venadera. 4, Miller on Emblem of Venadera. 5, Marguerite Conant on Fox's Sunshine Betty.

Senior heifer calf—1, Thorp on Wardress of Mossdale. 2, Fortini on The Gay Prince of Tintagel. 3, Fortini on The Briar Rose of Tintagel. 4, Thorp on King's Daisy of Mossdale. 5, Miller on Carmen of Venadera.

Junior heifer calf—1, Thorp on King's Miss of Mossdale. 2, Peterson on Violet's Induction of Waikiki. 3, Peterson on Waikiki Indiana Girl. 4, Miller on Signet of Venadera. 5, Sawyer on unnamed.

Senior champion bull—Jolly Senator Raleigh.

Senior champion cow—Salome of Mossdale; reserve, Jewel of Tintagel.

Junior champion female—Goldie's Dame Onota; reserve, Wardress of Mossdale.

Grand champion female—Salome of Mossdale; reserve, Goldie's Dame Onota.

Senior champion bull — Jolly Senator Raleigh.

Junior champion bull—King Mark of Tintagel; reserve, Sir Lancelot of Tintagel.

Grand champion bull— Jolly Senator Raleigh; reserve, King Mark of Tintagel.

Aged herd—1, Thorp; 2, Miller; 3, Thorp.

Young herd—1, Thorp; 2, Miller.

Calf herd—1, Thorp; 2, Miller.

Get of sire—1, Thorp; 2, Miller; 3, Thorp; 4, Miller.

Produce of dam—1, Fortini; 2, Thorp; 3, Thorp; 4, Miller.

Five cows in milk—1, Thorp; 2, Miller.

Milking Shorthorns

J. D. Rowe & Sons of Davis, lesees of the Alexander and Kellogg herd, fought it out with Thos. Harrison of Santa Rosa for the honors in the "dual purpose" show.

Harrison was best in the bulls with Count Tickford while the Rowe's great red cow, Bellevue Daisy, won the honors in the females.

The Rowes were successful in winning with their breeders young herd and their grand champion cow was first in the class for official record cows.

The milking Shorthorn is a great breed and while many of the animals shown could have placed in the beef classes their records for production equal those of many of the strictly dairy breeds.

Interest in this breed is growing steadily and before long there will undoubtedly be other exhibitors in the field.

Holsteins

Account of the exhibit of Holsteins is not received from Sacramento, but as general statement we may say that in number of entries the Holsteins did not come up to former years, but in general quality a finer class was never shown.

The awards were:

Exhibitors: Manuel Azavedo & Sons, Patterson; H. G. Ball, Tulare; Dr. H. N. Belgium, Richmond; Smith H. Bibens, Modesto; California George Jr. Republic, Chino; Edward Charters, Woodland; J. M. Christen, Martinez; Del Paso Heights Stock and Swine Breeders' Association, Del Paso Heights; V. F. Dolcini, Davis; Evelyn Foster, Petaluma; E. F. Gleason, San Juan Bautista; W. J. Higdon, Tulare; R. L. Holmes, Modesto; August Lauchert, Galt; Jouquia Lucio, Tulare; Palo Alto Stock Farm, Palo Alto; Thelma Peterson, Petaluma; The McCloud River Lumber Company, McCloud; Sierra Vista Stock Ranch, Perris; Six Bros. Dairy, Turlock; Clay Stammerjohan, Turlock; Katie Stammerjohan, Turlock; Loney Stammerjohan, Turlock; Reuben Stammerjohan, Turlock; Stella Stammerjohan, Turlock; William Stammerjohan, Turlock; D. E. J. Weldon, Sacramento.

Aged bull—1, George Jr. on Dichter Spofford Korndyke Lad 5th. 2, Del Paso on Bonita Sir Cornucopia Glista. 3, Stammerjohan on Inka Fraske De Kol.

Two year old—1, Lucio on Prince Bonie Walker. 2, Sierra Vista on Sir Ormsby Skylark Rauwerd.

A HIGH CLASS OFFERING

47 REGISTERED HOLSTEINS 47

Owned by ROBERT T. CURTIS & SON, Exeter, Cal.

Selling at

Tulare Sale Pavilion, Tulare, Cal.

Wednesday, October 5

at 10 A.M.

This is not a dispersal sale, but the owners are selling the cream of their herd, retaining some of the older cows to mate with KING PRILLY MEAD as the foundation for another herd.

The breeding of the herd is most substantial, with a number of outstanding individuals, and includes:

COLOMA BEAUTY BUTTER MAID, the great heifer that made 34.72 lbs. butter in 7 days as a junior 4 year old, after making 875.3 lbs. butter from 20,202.7 lbs. milk in one year as a junior 3 year old.

THREE DAUGHTERS OF KING KORNDYKE PONTIAC 20TH, the $12,000.00 son of Miss Valley Mead De Kol Walker. One of them out of Coloma Beauty Butter Maid, and one out of a 26 lb. daughter of the great foundation cow Winifred Hotaling.

GRANDDAUGHTERS of Tilly Alcartra, King of the Pontiacs, Pontiac Korndyke, Pontiac Aaggie Korndyke, Johanna McKinley Segis, and a group of 13 granddaughters of King Dollar.

A REAL HERD BULL PROSPECT

The sale includes a young son of KING KORNDYKE PONTIAC 20TH, out of a dam that made 773.12 lbs. butter from 22,637.9 lbs. milk in one year as a junior 3 year old. Six of his seven nearest dams have yearly records, four of them made as 3 year olds, and the six average 808.27 lbs. butter and 19,318.5 lbs. milk.

Every animal positively guaranteed to be a breeder; every animal over six months old Tuberculin Tested and sold subject to retest by the buyer.

THE SWINE

Poland Chinas

The Poland Chinas carried off all honors for number of hogs shown at this year's fair.

They did not come up to last year in numbers but they beat all the other breeds.

The show was above the average in quality and the type was pretty generally settled.

All things considered it was the best show the breed has ever made

Honors did not come easily and the prize money was well split up. There were probably never three such boars in one ring in this state as competed for the senior championship. Buster Bob, first prize aged boar shown by the Eastman Ranch, had the good wishes of Southern California, while Navy Boy, shown by Stephens and Gatewood of Fresno, and Western Rainbow, owned by Bassett Bros. of Hanford, divided the good will of the San Joaquin Valley folks.

Navy Boy was made senior and grand champion with Western Rainbow reserve.

In the juniors Straloch Farm of Davis won with Western C, a son of Liberty Girl 3rd, the grand champion sow of last year.

In this breed the junior yearling was the strongest aged female class with 12 showing. Hazel C., shown by Bassett Bros., won the class and later was made grand champion. Bassett Bros. also won the junior championship with Princess Pat.

The futurities were well split up and no one got too much money. The entire futurity allotment of $1,050 was competed for and claimed.

The silver cup awarded by the California State Poland China Association for the best sow under one year bred by exhibitor went to Bassett Bros., while Straloch Farm won the cup for boars. Straloch Farm also won the cup for the new exhibitor winning most money. The Eastman Ranch was close in line for this prize.

J. C. Meese, who judged the Polands, congratulated the breeders on their showing and said that many of their hogs could win in any eastern show, proving that they were right in regard to type and conformation and that they can go ahead.

Exhibitors—Bassett Brothers, Hanford; Buckland & McNeil, Fresno; George V. Beckman & Sons, Lodi; California Swine Corporation, Escalon; W. L. Choisser, Turlock; Fred A. Clark, Orland; J. H. Cook, Chico; Charles E. Dack, Fresno; A. J. Elliott, Turlock; Norman F. Eastman, San Fernando; Charles Gatewood, Fresno; Johnnie Glusing, Winton; H. A. Johansen, Fresno; P. B. Long, Tulare; Charles Stephens and Fred Gatewood, Herndon; Straloch Farm, Woodland.

Aged boar—1, Eastman on Buster Bob. 2, Bassett Bros. on Model Giant. 3, Cook on Orange Grant.

Senior yearling—1, Stephens and Gatewood on Navy Boy. 2, Buckland & McNeil on Giant Prospect. 3, Eastman on Eastman's Korver. 4, Beckman & Sons on Calivator. 5, Buckland & McNeil on El Capitan.

Junior yearling—1, Bassett Bros. on Western Rainbow. 2, Bassett Bros. on Cal. Rainbow. 3, Cook on Orange Yankee. 4, Elliot on Model Jones. 5, Elliot on Long Jones.

Senior pig—1, Dack on High Spot of Berma. 2, Stephens and Gatewood on Fresno Boy Jr. 3, Buckland & McNeil on Giant Checkers. 4, Elliot on Fortuna Boy. 5, Bassett Bros. on Liberator Buster 2nd.

Junior pig—1, Straloch on Westerner C. 2, Eastman on Topper. 3, Bassett on Peter Jones. 4, Straloch on Yankee Fashion. 5, California Swine Corp.

Aged sow—1, Buckland & McNeil on Hawkeye Maid. 2, Straloch on Miss Yankee. 3, Clark on Lady Jumbo. 4, Buckland & McNeil on Polandale Bettie. 5, Bassett on Janie Jones.

Senior yearling—1, Buckland & McNeil on Prospect Mollie. 2, Bassett on Timm's Jumbo Girl. 3, Elliot on Big Bone Orange Maid 3rd. 4, Calif. Swine Corp. on Iowa Maid. 5, Lillie Mae Wood on Lady Orphan.

Junior yearling—1, Hazel C., Bassett Bros. 2, Orange Giantess, Bassett Bros. 3, Long Babe, Elliot. 4, Lakeside Beauty, Beckman & Sons.

Senior yearling—1, Princess Pat, Bassett Bros. 2, Willows' Lady, Elliot. 3, Eastman's Choice, Eastman. 4, May Belle, Buckland & McNeil. 5, Orange Bobbie, Elliot.

Junior pig—1, Liberty Girl, Straloch Farm. 2, Buster's Giantess, Eastman. 3, Lady Victoria Sunland 4th, Johansen. 4, May Belle, Buckland & McNeil. 5, Long Maid, Elliott.

Senior champion boar—Navy Boy; reserve, Western Rainbow; junior champion boar, Western C.; grand champion boar, Navy Boy; reserve grand champion boar, Western Rainbow.

Senior champion sow—Hazel C.; reserve senior champion, Hawkeye Maid; junior champion sow, Princess Pat; reserve, Liberty Girl A.

Grand champion sow—Hazel C.; reserve, Hawkeye Maid.

Aged herd—1, Bassett Bros. 2, Buckland & McNeil. 3, Beckman & Sons.

Young herd—1, Straloch Farm. 2, Bassett Bros. 3, Eastman.

Breeders' young herd—1, Eastman. 2, Dack. 3, Beckman & Sons.

Get of sire—1, Bassett Bros. 2, Straloch Farm. 3, Elliott.

Produce of dam—1, Bassett Bros. 2, Straloch Farm. 3, Elliott.

Fat barrow—1, Gatewood. 2, Bassett Bros. 3, Bassett Bros.

Pen, 3 barrows—1, Bassett Bros.

Duroc-Jerseys

For a time at least during the summer it looked as though the red hog show would be pretty slim this year but when the breeders from the south woke up it became a show which, while not as big as the one last year was ahead of it on average quality. There were not as many outstanding good hogs as last year nor were there so many outstanding poor ones. The slump in hogs during the past year has served to eliminate most of the reds of poor quality.

William V. Mong of Your Duroc Farm at Whittier was the winner of the most money. Mong's herd, which is headed by My Partner, contains some very fine individuals and they were generally at the top. In the females, Pathfinder's High Lady, who was first in a class of 21 junior yearlings, trotted right out ahead of the field for senior and grand champion. Her herd mate, Colonel Pathfinder's Lady, was reserve senior champion.

Early in the show it was conceded that the sow which won in the junior yearling class would be champion as this was the best balanced and strongest class in the show. The man who could have picked 10 of these beauties for a foundation would never need to worry about his future in the hog business.

In the aged boars Choice Wonder 3rd, last year's grand champion shown by V. F. Dolcini of Davis, was first but was beaten for championship honors by the great boar, Royal I. Am shown by Cash & Kyne. This boar who was junior champion at Los Angeles in 1920 is generally conceded to be the best champion ever shown. He is just about all that a Duroc boar should be and weighs 800 pounds.

In the junior boar pigs Mong stepped out and captured first, second and third places and also won first in junior sow pigs and in the futurity litter contest. His futurity winnings amounted to $202. He also won both junior champions.

J. C. Craig of Owensmouth was a constant contender and won the much sought for blue in the herd bred by exhibitor class.

J. E. Thorp of Lockeford won the aged sow class and reserve grand champion.

In the barrow class H. P. Slocum & Son of Willows took practically all the honors.

Professor H. H. Kildee of Iowa state agricultural college made the awards:

Exhibitors: Lowell J. Beaver, Fresno; Harvey M. Berglund, Dixon; Fred M. Buck, Woodland; J. C. Craig, Owensmouth; William V. Mong, Whittier; Ordway and Snyder, Hughson; L. W. Pray, Durham; J. D. Rowe and Sons, Davis; Sierra Vista Stock Ranch, Perris; Cecil Slack, Napa; H. P. Slocum and Son, Willows; J. E. Thorp, Lockeford; The Western Laboratories, Stockton; Witherow and Stafford, Live Oak.

Senior pig—1, Dolcini on unnamed. 2, Sierra Vista on Lena Sensation. 3, Craig on Wanda 1st. 4, Craig on Wanda 2nd. 5, Dolcini on June Acres Wonder Lady 2nd.

Junior pig—1, Mong on Sensation Ellen. 2, Craig on Wanda 4th. 3, Mong on Sensation Annie. 4, Thorp. 5, Thorp.

Senior champion boar—Royal I Am. Reserve—Choice Wonder 3rd.

Junior champion boar—Hilong Sensation. Reserve—Prince of Pathfinder.

Senior champion sow—High Pathfinder's Lady. Reserve—Col. Pathfinder's Lady.

Junior champion—J. E. Thorp. Reserve—Sensation Ellen.

Grand champion boar—Royal I Am. Reserve—Choice Wonder 3rd.

Grand champion sow — High Pathfinder's Lady.

Aged boar—1, Dolcini on Choice Wonder 3rd. 2, Mong on My Partner. 3, Berglund on King Cherry Orion. 4, Western Laboratories on Western Regulator. 5, Slocum & Sons on Goldfinder.

Senior yearling — 1, Sierra Vista on Royal I Am.

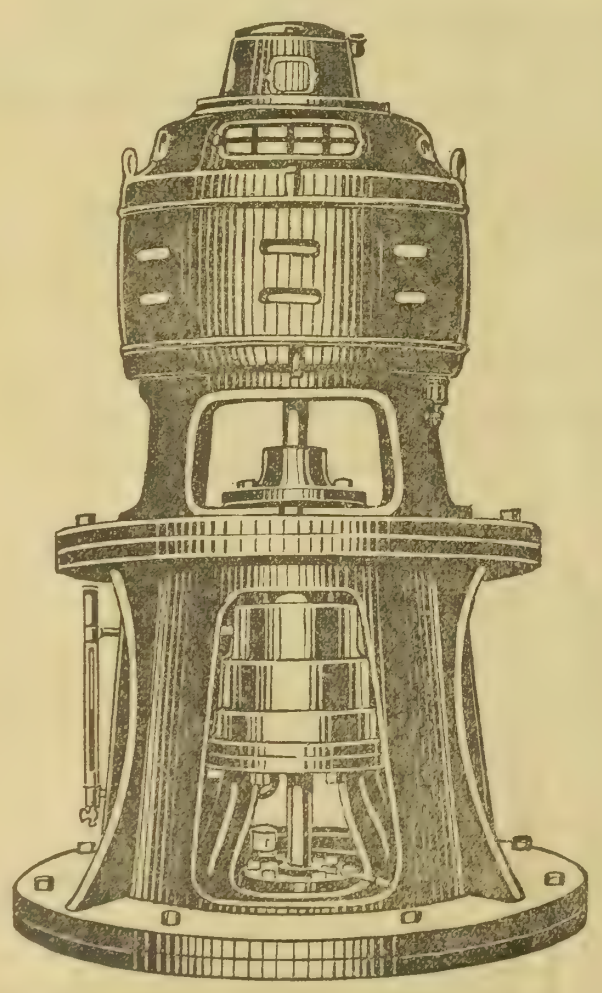
Junior yearling — 1, Slack on King Orion Defender. 2, Slocum on Key of Giant Jr. 3, Craig on Orion High Pathfinder. 4, Beaver on Falfadale's Sensation. 5, Slocum & Son.

Senior pig—1, Craig on Prince of Pathfinders. 2, Dolcini on June Acres Mabaska Wonder. 3, Slocum. 4, Craig on Rainbow Pathfinder. 5, Slocum.

Junior pig—1, Mong on Hilong Sensation. 2, Mong on Ainti Sensation. 3, Mong on Sensation Bankroll. 4, Thorp.

mammoth pump capacity
– a Layne & Bowler Achievement

Pictured below is the type of Layne & Bowler Pump recently installed on the Arroyo Ditch Company's property at Rivera, California. This pump produces 3,480 gallons of water per minute and is one of the largest producers on the Coast. L. & B. Pumps are manufactured in sizes and capacities to produce 180 to 4,500 gallons per minute.



Layne & Bowler Water Engineers At Your Service

Our organization includes the largest corps of expert water engineers to be found in the country. No matter what your water requirements may be our engineers can assist you in selecting the type of pump best adapted to your needs. If you contemplate the installation of a new pump or the development of a new water supply, secure authoritative advice from our engineers. This places you under no obligation to purchase L. & B. Pumps.

Hampshires

The biggest Hampshire show and the best the fair has ever known was the feature this year. Hayes & Harter of Grant's Pass, Oregon, brought down an excellent herd and James Marwick of Santa Barbara had another. Most of the honors went to one or the other of these herds with the outsiders cutting in occasionally. The awards follow:

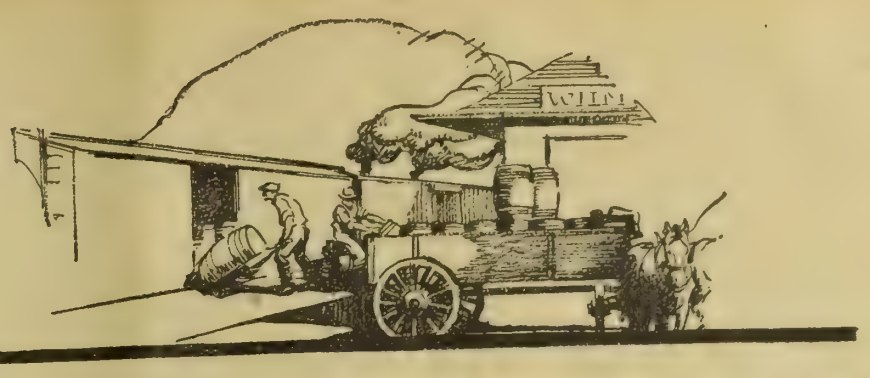
Exhibitors: J. M. Christen, Martinez; Everett Elmore, Hornbrook; Hayes & Harter, Grants Pass, Oregon; Hans J. Knudsen, Perkins; James Marwick, Santa Barbara.
Aged boar—Marwick on Exalted Ruler. 2, Elmore on King Sapphire.
Senior yearling—1, Elmore on Diamond Prince. 2, Elmore on Siskiyou Lad.
Junior yearling—1, Hayes & Harter on Model's Defender. 2, Knudsen on Routier. 3, Elmore on Klamath King. 4, Elmore on Miss Agate Prince. 5, Elmore on Pilot Rock Duke.
Senior pig—1, Marwick on Braemar Pershing. 2, Marwick on Braemar King. 3, Elmore on Silver King. 4, Elmore on Sapphire Boy. 5, Elmore on Maple Leaf Tommy.
Junior pig—1, Hayes & Harter. 2, Hayes & Harter. 3, Hayes & Harter. 4, Hayes & Harter. 5, Christen on Diablo King.
Aged sow — 1, Hayes & Harter on Sunny Slope's Princess. 2, Marwick on Tipton's Maid 2nd. 3, Christen on Empress. 4, Elmore on Tariet. 5, Elmore on Pride of Peace.
Senior yearling—1, Marwick on Ronnie Lass. 2, Hayes & Harter on O. U. R. Cornet. 3, Hayes & Harter on O. U. R. Cornflower. 4, Marwick on Blossom of Braemar. 5, Elmore on Snowflake.
Junior yearling — 1, Christen on Miss Emma. 2, Elmore on Dixie Queen.
Senior pig—1, Marwick on Lady Pershing. 2, Christen on California Lady. 3, Marwick on Braemar Queen. 4, Marwick on Braemar Princess. 5, Marwick on Braemar Duchess.
Junior pig—1, Hayes & Harter. 2, Hayes & Harter. 3, Marwick. 4, Christen. 5, Elmore.
Senior champion boar—Model Defender. Reserve—Exalted Ruler.
Junior champoin boar—Hayes & Harter.
Senior champion sow — Sunny Slope Princess. Reserve—Bonnie Lass.
Junior champion sow—Lady Pershing.
Grand champion boar — Model's Defender.
Pen 3 barrows any age of any breed—1, Marwick.

Berkshires

There were not so many Berkshires on exhibition this year as last, but the quality was never higher. From the first boar class to the carload of fat barrows there were plenty of outstanding individuals and so few plain ones that they were not noticeable.

The carload of Berkshire barrows shown by the Napa state hospital were January pigs and weighed 275 pounds. They have been fed slop from the hospital and soaked barley. Most of them were sired by a son of Star Leader. Last year's sensational load, which beat Mr. Bassets' really wonderful load of Polands, had some sows. This year it was a straight load of 30 head of barrows. The single barrow shown by Alex Wilson of the Italian Vineyard Company was an exceptional animal, a splendid type and wonderfully finished.

In the aged boar class there were five good ones, headed by Humphrey's Escalon Artral Leader 3rd, the best fitted and smoothest fleshed of the big ones. The judge liked the second prize boar, Escalon May Star, shown by Bastanchury, mighty well. He is big and long and stretchy, but lacked fitting. Only two senior yearling boars were shown, but they were big growthy ones. The junior yearling class was a big one with a lot of good ones. Cannon, a comparatively new but very enthusiastic breeder, won first and later reserve senior champion with a son of Rincon Leader, a boar of Brush breeding. Wilson of the Italian Vineyard Company had an easy winner in the senior boar pig



Why Are Your Railway Rates Higher?

Existing railway rates are high.

Not because railroad capital is seeking or getting a larger return, but because **railroad labor has thus far succeeded in keeping wages and rules of work fixed under war-time conditions,** and because coal and other things railways must buy are still high.

In 1916 the railroads earned a net return of 6 per cent. This return which they earned five years ago is all the Interstate Commerce Commission meant to assure them when it fixed the present rates.

Every increase in rates which has taken place since 1916 has been for the purpose of meeting increased operating expenses, of which labor is the big item.

The compensation paid to the owners of the railroads on capital invested in them has declined, while wages have greatly increased.

Below are the amounts paid by the Class 1 railways in wages to their employees and in dividends to their owners in the years 1912, 1916, 1919 and 1920:

	Wages Paid to Railway Employes	Dividends Paid to Railway Owners
1912	$1,209,716,686	$339,964,855
1916	1,468,576,394	306,176,937
1919	2,843,128,432	278,516,908
1920	3,698,216,351	271,429,999

Increase in wages in eight years, $2,488,499,665, or over 200 per cent.

Decrease in dividends in eight years, $68,000,000, or 20 per cent.

Railways Are Trying to Reduce Expenses

The railway managements for many months have been exerting every effort to bring operating costs down so that rates can be reduced. Railroad employees will not accept reductions in wages without controversy. Any such controversy must go before the United States Railroad Labor Board. The railways cannot under the Transportation Act make any reductions in wages that are not either agreed to by their employees or authorized by the Railroad Labor Board.

Since 1916 **wages have been increased over two billion two hundred million dollars.** They were decreased last July by $400,000,000 a year, **leaving five-sixth of the increase since 1916 still in effect.**

"National Agreements" Are Still In Effect

The railroads are still operating under the costly and wasteful rules and working conditions established by the "national agreements" under government control. They are still compelled to pay millions and millions of dollars for time not actually worked and to employ 3 or 4 or 5 kinds of high grade labor on work that one or two kinds performed before the war.

The railroads are making every effort to get the "national agreements" set aside and establish reasonable rules. The "national agreements" are still kept in effect by the demands of organized labor and the orders of the Railroad Labor Board.

The railroad managements are making every possible saving by increasing the average number of tons carried in each car, the average number of miles each car is moved per day, by reducing the number of their operating divisions, by economies in the use of coal and by refraining as much as possible from buying materials and supplies at present prices.

But all of these economies will not make practical a substantial reduction in rates unless the cost of railroad labor is further reduced.

No "Guarantee" to the Railroads Now

The idea that railroad managements have guaranteed to them a 6 per cent return and have therefore no incentive to economy is absolutely untrue.

Since September 1, 1920, no railroad could receive what it did not earn. Since that time the railroads have failed to earn a 6 per cent return by $518,000,000 and **have lost that sum forever.**

In this period of readjustment the railroads are taking their loss just like everybody else—**only they have no war-time surplus to take it out of.** Unlike many other industries, they accumulated no large surpluses because they were restricted under government control to the same net return they earned in the three years before the United States entered the war.

A decrease in operating expenses sufficient to make possible a general reduction in rates can be secured only by further substantial reductions in railroad operating expenses—including the abolition of war-time rules and working conditions so that the amount of work per day of each railroad employee will be something near what it was before the war.

Association of Railway Executives

61 BROADWAY, NEW YORK — 764 TRANSPORTATION BUILDING, CHICAGO, ILL. — MUNSEY BUILDING, WASHINGTON, D.C.

Those desiring further information on the railroad situation are requested to address the offices of the Association or the presidents of any of the individual railroads.

Santa Anita Rancho

Percherons

BELLZAR

Pure Bred Registered Percheron, Arabian, Thoroughbred Horses

Mammoth Jacks and Jennets

Holstein-Friesian Cattle

Big Type Poland China Swine

Southdown Sheep

A four year old son of the prize winning stallion Althazar, and out of the imported mare Mabel. Color jet black, weight 2,150 pounds. A stallion of great size, quality and action, with good legs and feet. Good disposition, and broken to service. The Rancho offers for sale at this time along with Bellzar, several high-class two-year-old Percheron stallions of grand conformation and style that weigh over 1,800 pounds. Also several Mammoth Jacks that are top-notchers, with size and quality and broken to service.

The Jacks are Black with white points, the big rangy kind with plenty of bone, weighing from 1,000 pounds to 1,115 pounds, two to four years old. Have a few real good Arabian stallions for sale, two and three years old. For those desirous of purchasing the best, bred and developed right here in California, it would be advisable to visit the Rancho and make a selection. All stock guaranteed.

MAKES OWN ELECTRIC LIGHT

With A. F. Swift, prominent dairyman of Talbert, Orange County, efficiency is more than a word; it stands out as a reality at every point. With one exception his dairy business with its model cow barn, silo, complete milking and bottling house and up-to-date milking machine was all that could be desired.

"I was greatly handicapped," said Mr. Swift, "by the lack of proper illumination. My men lost too much time working by lantern light. Experience has taught me that it gives big returns to surround my men with proper working conditions, so when I equipped my place with a Willys Light and Power Plant the results more than met my expectations."

Mr. Swift now runs his milking machine, brine circulating pump and other dairy machinery by electric power. His cow barn, milking house and other outbuildings are lighted by electricity. Three well placed yard lights brilliantly illuminate his entire yard, making working conditions about the whole place ideal, considering the fact that milking operations are started at one o'clock in the morning. The two family residences and bunk house are also illuminated, and the families have the great convenience of the various labor and time saving electrical appliances, such as vacuum cleaners, irons, etc. The results of electrifying his place are reflected in the contented working and living conditions, as now everyone works with precision and dispatch, doing considerably more work in a given time than could formerly be accomplished. Mr. Swift feels that the problem of keeping his men has been solved.

The cost of operating this plant is no greater than formerly required to run the milking machine. "The item alone of money saved that formerly went into less efficient service," says Mr. Swift, "more than pays a liberal dividend on the investment."

Considerable time has been saved by centralizing his power equipment in one place. A number of other ranchers and dairymen in the neighboring district, seeing the many advantages in the saving of time and labor, have followed in the footsteps of Mr. Swift.

GIVE TRACTOR BETTER CARE

It is reported, according to recent investigations conducted by both the United States department of agriculture and a number of state universities, that the average use of a tractor at the drawbar in the Mississippi Valley wheat and corn belt is 30.8 days per year. It is also generally conceded that the use of a tractor in California at the drawbar is something over 150 days per year on the average, in fact, a great many orchard owners with tractors operate continually day and night when ground conditions are most favorable for orchard work.

Another feature indicating marked differences is the fact that the average depth of plowing in the state of Illinois is 6½ inches while the average depth ground is worked in California is ten inches. Cover crops are often plowed in 12 inches deep. The average life of a tractor, as far as it can be determined, in the East is seven years. If this average is correct it would be 215.6 actual working days for the tractor. A tractor that will last seven years in California must be built to work 1,050 days. It is obvious then that a California tractor must have greater care and must not be expected to last so long under California conditions or it should be of the very best construction to compete acre for acre or year for year with the operating expenses existing in competition with the producer in the wheat belt.

It is no doubt true that there is more belt work in the East for tractors than in California. One large and well known ranch in Orange County keeping a record of its tractor operations shows the tractor runs over 200 days per year. It would seem then that the best possible tractor construction is essential to meet California conditions.

MORE WOOL AND MUTTON

Sheep breeders, ranchmen and animal husbandmen from six or eight states went to the United States sheep experiment station near Dubois, Idaho, this year for the annual shearing. Keen interest attaches to the work done at this station, especially by those who are alive to the importance of producing, if possible, a breed that shall combine weight in mutton and excellence in fleece, with special reference to market demands for fine or coarse grades of wool. In the shearing this year, just reported to the department of agriculture, the Rambouillets scored highest. The report shows: Average weight of wool per sheep—Rambouillets, 11.14 lbs.; Columbias, 10.15 lbs.; Corriedales, 10.08 lbs.; Corriedale grades, 10.00 lbs.

The station at Dubois was established by the bureau of animal industry in 1917 to conduct experiments with which it was hoped to solve some of the big problems in range sheep business. With only a little more than three years' experience the specialists do not consider the results sufficiently conclusive to warrant definite assertion in favor of or against particular range practice, but the work has attracted the attention of sheepmen everywhere, and is expected to become increasingly important as the experiments develop.

"It is quite generally agreed," said one of the sheep husbandmen, "that for the main part of the range sheep country of the Northwestern states the type of ewes obtained in the first cross between the long wools and the fine wools is a very desirable stock ewe. We appreciate the fact that fine wool rams were most popular in 1919, and that this was due in part to the high price of fine wool. Even should fine wool continue to sell above coarser grades, which is doubtful, we still could not afford to neglect the lamb side of the business that has been the cause of such large use of crossbred stock."

Sheepmen concerned in the business of producing sheep that shall combine mutton and the right kind of fleece watch with interest the development of the Corriedale grades and the Columbias. The Corriedale was imported from New Zealand in 1915 by the bureau of animal industry for this work. The Columbia is the Lincoln and Rambouillet cross interbred.

Mail all classified copy to Los Angeles Office.

POULTRY

Continued requests are being received by the California Cultivator for varieties of poultry not advertised in our columns. If any of you, our readers and friends, have any you wish to dispose of, send a small advertisement to this office and you will be doing our readers a service as well as yourselves.

Day Old Pullets—Here is your chance to get day old White Leghorn and Ancona chicks guaranteed at least 90 per cent pullets. We are taking orders fast for August and September delivery. We also have R. I. Red and Barred Rock chicks but do not separate the sex. All chicks are from strictly thoroughbred laying stock and are hatched right and shipped by Special Delivery Parcel Post. Send for prices and get your orders in at once. We also have a limited number of pullets from two to four months old and yearling hens. Orange County Hatchery, Santa Ana, California.

Petaluma Hatchery—Established 1902 by L. W. Clark. White and Brown Leghorn chicks from heavy laying free range stock, every Monday and Thursday. We positively guarantee safe arrival and full count of good strong chicks and no questions asked. Send for prices and terms. L. W. Clark, Petaluma, California.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, $1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

Baby Chicks hatched in Petaluma Incubators are a superior class. Strong, vigorous, sturdy, grow rapidly, lay early. Buy chicks from hatcheries using Petaluma Incubators. You will find one near you, if not, write us. Catalog free. Petaluma Electric Incubator Co., Petaluma, California.

White Leghorn Baby Chicks — Walter Hogan stock. We get all our eggs from one flock of over 4,000 Walter Hogan hens that have been carefully Hoganized. Our specialty is first class White Leghorn hens that satisfy our customers. We will have chicks September 1st. Lyon Hatchery, Gardena, California.

Foote's Bred-to-Lay Barred Plymouth Rocks. Fancy breeding cockerels from hens with trapnest records of 200 to 250 eggs. Buy now and save money. Will cost double next spring. Price now $5.00 to $10.00. Stanley S. Foote, 1177 East 53rd St., Los Angeles.

Baby Chicks—Barred Rocks and Reds, 25, $5.00; 50, $9.50; 100, $18.00; White Leghorns, 25, $4.25; 50, $8.00; 100, $15.00. Shipped every Monday. Parcel Post, special delivery, prepaid. Established 1915. Hargett & Son, Route 2, Box C, Compton, California.

Chicks Every Week from good layers. Fall Broilers pay. Pullets make good layers. R. I. Reds, Barred Rocks, White Leghorns. Safe arrival guaranteed. Write for circular. Stubbe Poultry Ranch & Hatchery, P. O. Box 67, Palo Alto, California.

Baby Chicks from my heavy laying, carefully selected strain of pure bred S. C. White Leghorns. I am booking orders now for September and October delivery. Good chicks at reasonable prices. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live, vigorous chicks guaranteed. No money in advance; pay on delivery. Prices on request. Established 1898. MUST HATCH INCUBATOR CO., 438 Seventh St., Petaluma, California.

Barred Plymouth Rocks — "Wonderful Layers," champion prize winners. Nothing better in poultry. Choice stock and hatching eggs. Catalog free. Charles H. Vodden, Los Gatos, California.

White Leghorn Baby Chix from Petaluma's heaviest producing stock. We guarantee safe arrival. Literature on request. Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

Watch Us Grow: Fall chicks, Rhode Island Reds, B. Rocks, White and Brown Leghorns and Anconas. E. W. Ohlen, Campbell, California.

Regular White Wyandotte cockerels, February hatch. White Feather Farm, Howard Burns, R. R. No. 1, Chowchilla, California.

"Eastman's Bred-to-Lay" Barred Rocks. Fall Chicks—March, April pullets. Fairmead Poultry Farm, Fairmead, California.

Success in business is attained by experience and knowledge. The poultry business can be made to pay by following the teachings and information contained in POULTRY FOR PROFIT, $1.00 postpaid. Cultivator Publishing Company, Los Angeles, California.

SEEDS AND PLANTS

Strawberry Plants for the Pacific Coast, such varieties as Nick Ohmer, Marshall, Kellogg's Premier, Klondyke, and about 30 other varieties; also Dewberries and Raspberries. Ask for free catalogue. V. R. Allen, Seaford, Delaware.

GOATS

Excellent Brush Clearers — Sixty does, good foundation for milk goat herd; bred to purebred Toggenburg buck. Eight dollars each, f. o. b. ranch. H. G. Ranch, Buellton, California.

For Sale—Pure Swiss Toggenburgs, does and bucks, from finest milk strains. La Corona Goatery, R. 1-416, El Monte, California.

FARM LAND FOR SALE

FARM RENTERS

You can become a farm owner on terms very much like those you are now paying to rent land. We have deep, rich soil with complete irrigation and drainage systems. We are willing to cooperate with hard working, reliable men who want to become owners of farms. Sutter Basin (in the heart of the Sacramento Valley) is your opportunity. Write now.

SUTTER BASIN COMPANY,
California Fruit Bldg., Sacramento, Calif.

For Sale—65 acres deciduous fruit land, 15 acres cleared; balance partly cut over pine and oak. Buildings, family fruit, berries; 2,000 feet elevation; pressure irrigation system, R. R. siding adjoining, electricity available; live American community. Good school and church, on main road. $6,000 for quick sale. C. H. Eckles, Paradise, Butte County, Cal.

Lake County Land for Sale—Bearing pear and prune orchards, dairy and stock farms. Alfalfa and grain land and other properties. Address Joe Hyman, Lakeport, Lake County, California.

125 Acres, Tulare County, clear, level, plenty water for irrigation. Sell or trade for Southern California property. $12,000, terms. Inquire owner, Jas. S. Beardsley, Julian, California.

20 Acre Alfalfa Dairy Ranch, none better in Turlock irrigation district; also cows, hay. Harmon Berg, Hughson, Cal.

For Sale — Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

CATTLE

For Sale — Several registered Guernsey bull calves, one old enough for service, Edgemoor Farm breeding, reasonably priced. Apply to Dr. J. A. Woodside, Santee, San Diego County, California.

Guernseys — Grape Wild Farms—Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

For Sale—My herd bull, Finderne Soldene Pontiac Valdessa 206927. His dam, granddam and great granddam were all World's Record cows. Great bargain. Geo. A. Smith, Corcoran, California.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Yearly Record Holsteins—Bulls from 500 to 1,000 pound dams and by World Record sires. A. W. Merris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Some Choice registered Holstein heifers and bulls of serviceable age for sale. J. W. Scudder, Escalon, California.

Winsor Ranch Jerseys—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

MACHINERY

For Sale — Another big drop. Rebuilt windmills, tanks, pumps, cylinders. Why pay more. We make galvanized tanks, 400 gallons, $16.25; 600, $26.25; 1000, $37.25; 2000 capacity, $48.25. New irrigating pipe, 3-in., $13.50; 4-in., $17.50. Demmitt Co., office 120 N. Main, L. A. Phone 15191.

For Sale—Model M Samson Tractor, used one season. Just overhauled and ready to work. Ballbearing front wheels, double extension rims and grousers, eight foot tandem disc harrow; $650.00 takes it all. W. A. Carlisle, Box 513, Maricopa, California.

For Sale: Beeman Tractor in good condition, with plows and cultivator attachments. Two Hundred Dollars cash. W. Lee, 7263 Santa Fe Ave., Los Angeles, California.

For Sale—Sorghum Mill, power driven, with large copper evaporator. Reasonable price. D. E. Furrow, R. D. 2, Highland.

LIVESTOCK

For Sale — Imported Percheron Stallion, good bone, fine action, excellent disposition, easy and safe to handle. Sires satisfactory colts with good dispositions. Several times grand champion. Worth $2500. Will sell for $1500, or consider trade for hay, straw, manure or heifers. J. J. Prendergast, Redlands, California.

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

CORN HARVESTER

Corn Harvester cuts and piles on harvester or winrows. Man and horse cuts and shocks equal Corn Binder. Expressed to every state. Only $28 with fodder tieing attachment. Testimonials and catalog FREE showing picture of harvester. Process Harvester Co., Salina, Kansas.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

TREES

Carobs: California Wonder Tree, 10 to 20 tons to the acre of richest food grown; beautiful evergreen ornamental tree, fine for parkway, unsurpassed for windbreaks. Carob is not a soil robber but a nitrogen feeder. Send $2.00 for four sample trees; plant now. Original Carob Nursery, Colton Ave., No. 2, Box 60, San Bernardino, California.

Pedigreed Flemish Giants — No fancy prices. Maud Beeching, 1578 W. 46th St., Los Angeles.

class with Guasti's Leader Champion. One of the most attractive pigs in the show was the junior boar, Guasti's Rival. He was made junior champion and reserve grand champion.

The senior sow class is always the most attractive one in the show and especially so this year. No one has ever shown a better sow in California than Violets Festine, shown by Wilson. She was first in class, senior and grand champion. She just fills the eye, and is one hog that shows herself. Last year's champion, shown by Humphrey, was placed third, but she farrowed a litter of 12 and was not in bloom. Castleview Royal Duchess 2nd was an easy winner in the senior yearling class. Commenting on the aged sow class Jenkins said: "It is a pleasure to look over a ring like this. I have never seen a better one, and there are sows here that did not get in the money that would win at most fairs." The ringside was delighted with the judging and of course with Ralph Jenkins.—W. S. Guilford.

The awards follow:

Exhibitors — D. J. Bastanchury, La Habra; H. W. Cannon, Suisun; A. B. Humphrey, Escalon; Italian Vineyard Co., Guasti; Leonard Estate Co., Grants Pass, Oregon; James Mills Orchard Corp., Hamilton City; H. S. Teasdale, Elko, Nevada.

Aged boars—1, Humphrey on Escalon Artful Leader. 2, Bastanchury on Escalon May Star. 3,Italian Vineyard on Model Leader 3rd. 4,James Mills on Laurel Lustre Boy. 5, Leonard on Pacific Epochal.

Senior yearling—1, Humphrey on Grape Wild Leader 4th. 2, Italian Vineyard on Baron Duke Natomas.

Junior yearling—1, Cannon on Cashier 3rd. 2, Italian Vineyard on Matchless Type 2nd. 3, Bastanchury on La Habra May Star. 4, Humphrey on Grape Wild Champion. 5, Leonard on River Banks Champion.

Senior pig—1, Italian Vineyard on Rosa's Duke. 2, Leonard on River Banks Champion 26th. 3, Humphrey on Grape Wild Emblem 2nd. 4, Humphrey on Grape Wild Duke. 5, Leonard on River Banks Champion 27th.

Junior pig—1, Italian Vineyard on Guasti's Rival. 2, Humphrey on May's Challenger. 3, Humphrey on Grape Wild Leader 10th. 4, Leonard on River Banks Champion 28th. 5, Italian Vineyard on Model Rockwood.

Aged sow—1, Italian Vineyard on Violet's Festline. 2, Humphrey on Grape Wild Rose 8th. 3, Humphrey on Grape Wild Rose 6th. 4, Humphrey on Escalon Artful Belle 5th.

Senior yearling—1, Italian Vineyard Co. on Castleview Royal Duchess 2nd. 2, Italian Vineyard Co. on Real Types Belle 4th. 3, Humphrey on Escalon Belle 6th. 4, Humphrey on Escalon Princess 8th.

Junior yearling—1,Italian Vineyard Co. on Peerless Royal Lady 3rd. 2, Italian Vineyard Co. on Matchless Lady Type. 3, Humphrey on Escalon Belle 12th. 4, Italian Vineyard Co. on Burton's Oregon Lady. 5, Humphrey on Grape Wild Bernice 16th.

Senior yearling—1, D. J. Bastanchury. 2, Humphrey on Grape Wild Laurel 2nd. 3, Humphrey on Grape Wild Bernice 13th. 4, Humphrey on Escalon Ruby. 5, Italian Vineyard Co. on Riverby Duchess 55.

Grand champion sow—Violet's Festline; reserve, Peerless Royal 3rd.

Aged herd—1, Italian Vineyard Co. 2,

California Egg Laying Contest

By J. E. Dougherty

THE August production of the 540 contesting hens in the California farm bureau egg laying contest at Santa Cruz was 51½ per cent, and the average production of the flock for the 304 days ending August 31 was 166 eggs per hen. Even though the ensuing 61 days of the contest include the least productive months for eggs, the contest flock is undoubtedly going to cross the finish line with an average flock record well toward the 200 mark.

Hanson's entry strengthened their lead over the second high pen this month by 24 more eggs than their lead at the end of July. They are now 64 eggs ahead of Geo. Gray's pen which is still going strong in second place. August production carried S. L. Gibson's pen 30 from 6th to 4th high place and dropped Hollywood's entry back into 6th position. Warren Wood's pen No. 49 climbed into 10th place on its August record but the Santa Barbara ranch entry slowed up so much that it lost its place among the 10 leaders.

A noteworthy individual monthly record was made by O. A. C. Barred Rock No. 72. This hustling lady has been a heavy layer month after month and her August performance jumped her from 6th to 2nd place. She is only 11 eggs behind Miss Hollywood No. 53 now and is evidently going to be a dangerous competitor for the silver cup for high individual at the close of the contest.

Seventy-four more hens passed the 200-egg mark this month than the 24 reported at the end of July. This makes a total of 94 hens that have laid 200 or more eggs to date.

Leading Pens

Hanson's Poultry Farm, Corvallis, Oregon, 2,099 2/3 eggs; Geo. Gray, Santa Cruz, 2,035 2/3; W. H. Marshall, Santa Cruz, 2,031 2-3; S. L. Gibson, Santa Cruz, 2,028 2/3; W. A. Ford, Umatilla, Oregon, 2,018 2/3; Hollywood Farm, Hollywood, Washington, 1,997; Gibson, 1,940 2/3; Gibson, 1,878; Alex Stewart, 1,867; Warren Wood, Santa Cruz, 1,860 1/3.

High Hens

Hollywood Farm, 251 eggs; Barred Rocks, Oregon Agricultural College, 240; White Leghorn, Oregon Agricultural College, 239; J. S. Conrado, Santa Cruz, 238; Hanson's Poultry Farm, 238; Hollywood Farm, 234; La Rita, Santa Cruz, 232; Ed Crewdson, Santa Cruz, 231; Hollywood Farm, 231; Geo. Gray, 230; Hanson's Poultry Farm, 230.

The race for the blue ribbon for high pen for August was very close, S. L. Gibson winning by one egg over Geo. Gray. High pens for the month are: Gibson, 210 eggs; Gray, 209; D. B. Balls, Petaluma, 206; Wood, 204; Hanson, 203 1/3; Gibson, 202; Stewart, 201 1/3.

The ribbon awards for high individuals for August were closely contested for, four pens tying for third place. The awards follow: Walls, Petaluma, 29 eggs, first; O. A. C., Barred Rocks, 28, second; Wood, Santa Cruz, 26, third; Gray, Santa Cruz, 26, third; Walls, Petaluma, 26, third; Walls, 26, third.

The average amount of grain and mash consumed per 100 hens for the 31 days of August was approximately: 9.4 pounds mash, 9.3 pounds dry scratch grain mixture, 4.5 pounds sprouted barley (dry weight), ¼-inch sprouts. The amount of mash consumed for the month was less than anticipated, being brought about by the increase in molting birds. Beginning with September, both the amount of sprouted and dry grain will be decreased with the object of restoring the desired equal consumption of grain and mash.

All birds, unless otherwise indicated, are S. C. White Leghorns. Fractional figures in pen records result from dividing floor eggs by the three entries in each pen.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, August 29, 1921. Report for week ending August 29.

The hens in the contest at Storrs are running a good race. Their production to date is 140,479 eggs and they still have nine weeks to go. The production for the week was 3,381 eggs or a yield of 48.3 per cent. This is 49 more eggs than last week but 29 eggs less than the six year average.

The 500 Leghorns are leading all other breeds with an average egg production of 149.7 eggs per bird. The 270 Reds are second with an average egg production per bird of 134.8 eggs. The 140 Rocks are third with an average of 127.1 eggs per bird. The 90 other birds, which includes the Wyandottes, Brahmas and Black Leghorns, have an average production of 126.7 eggs each.

A pen of Rhode Island Reds owned by Pinecrest Orchards, Groton, Massachusetts, was first for the week with a production of 56 eggs. A pen of White Leghorns owned by Hollywood Farm, Hollywood, Washington, was second with a production of 52 eggs.

The four leading pens in each of the principal varieties are:

Barred Plymouth Rocks

W. H. B. Kent, 1,765 eggs; Rock Rose Farm, 1,517 eggs; Jules F. Francais, 1,455 eggs; James F. MacDonald (White), 1,351 eggs.

Rhode Island Reds

Charles H. Lane, 1,725 eggs; the Orchards, 1,601 eggs; Sunnyfield Farm, 1,586 eggs; H. S. Bickford, 1,564 eggs.

White Leghorns

Hollywood Farm, 1,852 eggs; L. E. Ingoldsby, 1,814 eggs; Jack Trevethan, 1,751 eggs; Burchell & Janson, 1,749 eggs.

Other Varieties

Obed G. Knight (White Wyandottes), 1,935 eggs; H. P. Cloyes (Buff Wyandottes), 1,497; A. E. Hampton (Black Leghorns), 1,371; Harry D. Emmons (White Wyandottes), 1,247 eggs.

Poultry Queries

(Conducted by Jean A. Koethen.)

Fireless Brooder

Will you please tell me how to make a fireless brooder?—Subscriber, Terra Bella.

Fireless brooders may be of different sizes to accommodate 25, 50 or even 100 chicks, but the easiest to make, and I believe the most satisfactory in the long run, is the Philo model. This accommodates 25 chicks, never more, for the reason that 25 chicks can be kept warm by the heat of their own bodies, while a smaller number cannot and a larger number is apt to crowd or to pile up one on top of the other. The Philo brooder is about 13 or 14 inches square and six to eight inches high. The exact height is not important, but the box should not be

Remember The Horse Shoe Tread

27,900 MILES—

More than the Distance Around the World

A Horse Shoe Tire on one of the cars owned by the Mack Sennett Film Corporation gave this remarkable mileage.

Think of the punishment a tire must stand under all kinds of road and weather conditions and at various speeds.

Is it not conclusive evidence of the quality of materials and workmanship and positive proof of the integrity of the manufacturers of Horse Shoe Tires.

There is no better guarantee of Economy than such examples of long mileage and dependability.

larger than 14 inches square because that leaves too much air space inside with 25 chicks. Any clean box of the right size will do. Now cut a door about four inches wide in one side and fasten the piece you cut out on a cleat in such a way that it can be replaced when the chicks are inside. Next, tack a cleat around the inside of the box five inches from the bottom, and make a light frame to fit loosely on top of the cleat. This is the frame for the quilt which should be of cheese cloth and cotton and thick enough for a baby's bed. Tack this on the frame, not too tightly, for ventilation at first will have to come in around its edge, and let it sag in the middle till it almost rests on the bottom of the box. Hung in this way your quilt is always ready and can be removed quickly. Now, cover the bottom and sides of the box with tar paper, a single piece is best for you do not want it to fit in to the corners. A brooder is better without corners. You are ready now for the nest litter which should be the softest straw or chaff you can find. Put in plenty, and mold it into a deep, round nest. The first few nights the chicks will get air enough around the sides of the quilt, but after that, especially if the weather is warm, the door may be left partly open. This brooder should be used in a coop or house, not out of doors.

Brooder Houses

Would like suggestions for brooder house for raising chicks on commercial scale. In your judgment are the so-called manure brooders suitable, or would you recommend some other type?—Subscriber, Laws.

You will find several types of brooder houses described in "Poultry for Profit," and I am mailing you descriptions of one or two others. I do not understand what is meant by the term "manure brooder." If that is another name for fireless brooder, as I suspect it may be, I can only say that the fireless brooder, while it works very well in small flocks and warm weather, is not well adapted for raising large flocks in winter, and there are few commercial poultrymen, if any, that do not use some form of heated brooder. The big brooder stoves around which a thousand or more chicks may be brooded in one room, with a room adjoining for exercise and a runway to the outside yard, has probably been more largely used on commercial ranches than any other, because it is less work than keeping chicks in small flocks, but a good many poultrymen still cling to the hot water and gas brooders, which brood only 100 chicks under a single hover. Now the electrical brooders are superseding the stoves in some localities. They are somewhat more expensive, but there is less danger of fire. Like the stoves they can be used in any kind of room or shed where there is protection from the weather, and for any size of flock. The simplest wooden building, 12 feet square or 12 by 20 for hot water brooders, with the south mostly glass, can be used for housing any one of these systems of brooders.

Cement Floors

Are cement floors advisable in poultry houses, and how should they be put in? Some claim cement is too cold.—Subscriber, Hughson.

Cement is too cold and too hard for the hens' feet if it is not covered. When covered with six to ten inches of sand and as many of straw on top of the sand it makes the very best possible floor, because it is rat proof, and, if properly built, rain proof. The cement floor should not be built on the level only, like a board floor, but should run up on the sides several inches. This keeps out any water that might drain in.

AN INCLUSIVE STATEMENT

There was a commotion in the poultry house, and the barking of the dog aroused the owner, who sallied forth with a shotgun loaded for business.

"Who's in there?"

No answer.

"I say who's in there "

Silence.

"Who's in there? If you don't answer, I'll shoot."

"Please, white man, dey ain't nobody in hyer but des us chickens."

LARGEST POULTRY FARM IN ARIZONA

By M. E. Bemis

AN EXAMPLE of success due to hard work, attention to details and a careful study of his business, is that of C. D. Bowker of the Roosevelt district near Phoenix.

About nine years ago he was renting land for general farming. His home place was a ten acre tract where a few chickens were kept, but no special attention given to make them a feature of farming operations.

Then it became more difficult to rent desirable land, and about that time he and his wife began to compare notes and they found that the chickens were returning more profits for time and effort expended than any other branch of the farming business. Right then they began to expand in the poultry business and contract in general farming.

Little by little this poultry farm has grown until today they have almost 3,000 layers. Every phase of the business has been studied carefully, and although his methods do not in all ways have the approval of other poultrymen, the fact that Mr. Bowker has made money in his enterprise is sufficient excuse for any methods he has adopted and proves to his own satisfaction at least that they are applicable to poultry keeping in this section.

He expects to gradually increase the capacity of his plant to 5,000. At the present time about one-third of the flock are old hens, the others pullets. One-half of the ten acre tract is used as range for young chicks and to some extent as pasture for horses and cows. The remaining five acres is divided into four equal tracts for the laying stock. Each field is fenced with a nine foot chicken fence. The eggs are marketed in Phoenix and sold as strictly fresh guaranteed eggs, always bringing the top market price.

During the past two seasons a few chicks were hatched and sold as day old chicks. For the most part, however, the plant is run as a commercial egg plant. The hatchery has a capacity of 14,000 chicks. This takes care of some of the surplus stock of eggs during the season of greatest production. As a further check against over production eggs are stored in one of the Phoenix cold storage plants and taken out when egg production begins to slacken.

Profits last year, according to Mr. Bowker's figures, were around $6,000. This is due quite largely to the fact that Mr. and Mrs. Bowker attend to practically all details, giving close supervision and performing most of the work.

The feed is largely barley and bran, very little animal protein, such as beef scrap, being fed.

White Leghorns are bred exclusively and every attempt is made to maintain a high average quality of healthy productive stock.

MORAL HENS

A young married woman who moved into the country, considered the keeping of hens a pleasant and profitable undertaking. As she grew more absorbed in the pursuit her enthusiasm increased.

During one of her animated descriptions of her success a friend inquired: "Are your hens good layers?"

"Oh, yes," she replied, in a delighted tone; "they haven't laid a bad egg yet!"—London Tit-Bits.

Hurry the Molt–
Get Fall Eggs
Hens can't make feathers and eggs at the same time. The quicker they get through the molt, the earlier they begin laying.
Get your hens back on the job early—get lots of eggs this fall and winter—get the profits from winter eggs. Help your hens to keep in perfect health—to overcome the strain of feather-making—to avoid the danger of molting-time sickness—to shell out lots of eggs. Give your flock
Pratts Poultry Regulator
the time-tested, guaranteed poultry tonic and conditioner. "Pratts" naturally strengthens and invigorates the whole system—helps the molting hens—hurries the growing pullets to early laying maturity. The natural result is EGGS, more eggs than your flock could lay without this great help. Note how well they can lay with this help. Save Money! Buy Pratts in 12- or 25-lb. pails; 50- or 100-lb. bags.

The Union Sure-Grip Tractor 12-25, Model D

The Lowest Price Ever Placed Upon A High Grade Tractor Like This

After several years devoted to developing and building a tractor which in actual service has proved to be one of the most succesful machines ever produced, this company wishes to announce that it now will discontinue manufacturing this type of equipment. To those persons who plan now or at any future time to purchase a machine of this kind, this policy offers an unusual opportunity.

Old Price $3500.00 ➡ **PRICE NOW $1,750.00**

A Saving of Almost $2,000.00

To insure quick clearance of our tractor shop and warehouse, we have slashed the price of the few remaining tractors on hand to $1,750.00—just half the former price. A written guarantee to maintain a complete and adequate stock of all repair parts during the life of these tractors, goes with each machine.

The reduction in price does not mean that the Union Sure-Grip Tractor is not worth the full price for which it always has been sold. We simply are discontinuing the manufacture of this type of equipment and are willing to stand the loss in order to move the few we have left immediately.

If you ever intend to buy a tractor, investigate this opportunity now. Send the coupon today for full particulars of this offer, also complete specifications and records of these tractors in service. There are only a few left and they will go quickly at this price.

To same date last season: Oranges, 261; lemons, 23; total, 284.

Important to Bean Growers

The handling of beans with a side delivery rake is certainly the most practical and economical way to handle the crop provided the rake used is properly built and properly geared for the handling of beans.

In the ordinary side delivery hay rake the cylinder is speeded entirely too high for beans. When the cylinder runs at a high speed the beans are handled so roughly that a great many are threshed out of the pods and lost. The Thomas Side Delivery Bean Rake is especially geared for the handling of beans. The cylinder moves much more slowly than it does in a hay rake.

Dixon & Griswold at No. 130 North Los Angeles Street have in stock the Thomas Side Delivery Rakes geared especially for beans and also have them in stock geared for hay. They are offering them at a special price of $100.00 each f. o. b. any railroad point in California or Arizona. Your dealer can easily get a Thomas for you at this special price. If there is no dealer in your section you can order a rake yourself by 'phone. The telephone number is 62852 Los Angeles.

QUESTIONS AND ANSWERS

(Continued from Page 290.)

ly woven muslin. This bag of the arsenate may be shaken over the roasting ears at the time when silk is first forming. Care should be used not to apply too liberally. This has the same effect on the worm which begins eating the roasting ear as it does on the worm when it begins to eat into the sprayed apple.

COMBINATION FARM IMPLEMENT

California ranchers have found almost constant use for various kinds of cultivators, subsoilers and furrowers. J. R. Gardiner, a manufacturer of farm implements at Fullerton and for many years a successful rancher, has been manufacturing a combination of these three implements in one, thereby cutting down the initial cost of a grove owner's outfit. The frame of the implement is made to carry either the cultivator, the furrower, or the subsoiler, the parts being easy to change. A great many California ranchers are operating the Gardiner combination successfully.

DISPERSAL

of One of California's Most Highly Esteemed Herds

ELDORADO HERD, Owned by ALEX WHALEY

55 REGISTERED HOLSTEINS 55

Selling at Tulare Sale Pavilion, Tulare, Cal.

Thursday, October 6, at 10 A.M.

Constructive breeding methods as exemplified by official testing, careful selection of breeding females, and unusual foresight in placing at the head of his herd a succession of top notch herd sires, has won for the owner a high standing among the breeders of California, and whenever representatives of the herd have appeared in public sales they have almost always met with high public appraisal.

Now that the entire herd is to be dispersed it affords new breeders an opportunity to buy a class of cattle of excellent qualifications as money makers, high class individuals and of most popular breeding. The sale includes:

MELBA HENGERVELD, the great 30 lb. producing and breeding cow. and her daughter by Sir Veeman Korndyke Pontiac, and granddaughter by King Sadie Vale Idyl Segis. All three of them are due to calve before December 8 to Sir Aaggie De Kol Acme 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year. This family is good enough to add to any herd, and just think of the three calves they will drop shortly!

TWENTY DAUGHTERS OF SIR AAGGIE DE KOL ACME 2ND

ONE out of the 30 lb. junior 4 year old Eldorado Winifred, whose dam is the 32 lb. cow Winifred Hotaling 3d.

ONE out of an 18 lb. 2 year old daughter of the $50,000.00 bull King Segis Pontiac Alcartra.

ONE out of a 27 lb. cow that milked 601 lbs. in 7 days.

ONE out of a 20 lb. 3 year old whose dam milked 627.5 lbs. in 7 days.

TWO out of an 18 lb. granddaughter of Segis Pontiac De Kol Burke.

ONE out of a great 24 lb. cow that was second prize aged cow at this year's State Fair.

OTHERS out of dams with records up to over 23 lbs. butter in 7 days.

AND MANY OF THEM ARE BRED either to a son of the 34 lb. Coloma Beauty Butter Maid or to King Tola Korndyke Pontiac, described below.

KING TOLA KORNDYKE PONTIAC WILL BE SOLD

He is unquestionably one of the highest class young bulls in the state, and is by KING KORNDYKE PONTIAC 20TH, the $12,000.00 son of Miss Valley Mead De Kol Walker, and out of K P Tola the 36 lb. daughter of King of the Pontiacs. If you want a real herd sire take this fellow home with you.

YOUNG BULLS FOR DAIRYMEN

There will be about a dozen young bulls in the sale, many of them sons of Sir Aaggie De Kol Acme 2nd. that should go to good dairy herds.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

Management
California Breeders Sales and Pedigree Co.
C. L. Hughes, Sales Manager, Sacramento, Cal.

Owing to the demands of other business interests, and recent ill health of the owner, Mr. S. O. Walker will make a complete dispersal of his herd of highly bred registered Holsteins.

The breeding of this herd is such as to command attention anywhere, the cattle are in excellent condition, and the herd is mostly composed of young females, including

35 DAUGHTERS OF KING OF THE BLACK & WHITES, many out of A. R. O. dams with records up to over 30 lbs. butter in 7 days.

A 25 POUND daughter of the four times 30 lb. cow Lottie Walker Spafford.

TWO HALF SISTERS TO KING OF THE BLACK & WHITES, one out of a 31 lb. 4 year old daughter of King Segis, the other out of a 23 lb. daughter of King Segis.

Dispersal Sale
70 REGISTERED 70 HOLSTEINS
S. O. Walker Herd
Visalia, Cal.
Tuesday, Oct. 4 at 10 a.m.

A 26 POUND COW due to calve October 12 to King of the Black & Whites.

A 25 POUND granddaughter of King of the Pontiacs out of a 25 lb. 4 year old.

A 25 POUND daughter of the four times 30 lb. cow Lottie Walker Spafford.

A 25 POUND granddaughter of King of the Pontiacs out of a granddaughter of Pietje 22nd's Woodcrest Lad.

HIGH CLASS BULLS

KING OF THE BLACK & WHITES will be sold. He was the first bull whose seven nearest dams averaged over 30 lbs. butter in 7 days, and has one of the largest lists of A. R. O. daughters of any bull on the Pacific Coast. He is ten years old, a quick sure breeder, and sells in excellent physical condition. His service for two or three years in a good herd would justify a substantial valuation on him today.

TWO GRANDSONS OF SIR PIETERTJE ORMSBY MERCEDES, both out of good record dams and both good individuals.

YOUNG BULLS, mostly sired by King of the Black & Whites, and out of some of the best dams in the herd.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO TUBERCULIN TEST CERTIFICATES.

TERMS OF SALE: Cash unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three, six and nine months to responsible parties on approved notes.

PLACE OF SALE: S. O. Wakler Ranch, 3½ miles east of Visalia on Mineral King Avenue, then ½ mile south.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor

CALIFORNIA CULTIVATOR

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LVII — September 24, 1921 — No. 13

Know the Game---It Beats Guessing

California leads the world in control of pests affecting agriculture. This state led the nation is agitating for quarantine regulations. Now we are leading in standardization which naturally encourages more perfect pest control.

Information given in this issue of the California Cultivator as to best methods of pest control is general, and perhaps the long time orchardist may have much that is here gathered. But it is placed together in most convenient form. It will prove invaluable and well worth the filing.

For the reader looking for a Royal Road to success in knocking out all pests with one cure-all there will be little help in this issue. For the patient digger after facts we hope it will prove a classic.

IN THIS NUMBER

Fighting Pests is Like Driving an Airplane	On this page
Stray Thoughts and Editorial Suggestions	310
What the Quarantine is Doing for California	311
An Insect Which is Our Friend	311
Formulas for Sprays	313-317

Garden Pests	323
Household Pests	324-327
Relieve the Livestock	328
Poultry Parasites	336

There are insects and insects. There are "insects" that are not insects. We asked Mr. Ryan, horticultural commissioner of Los Angeles County, to help us to separate bugs from beetles, spiders from centipedes, sow bugs from slugs. He suggested that no bug is a beetle, nor the reverse. The old nursery rhyme "Lady bird, lady bird fly away home" correctly locates one of our friends among the insects, but a bug "she" never is and often not a member of the gentler sex. A beetle is this little fellow, not plain, nor simple either it would seem, for the little red and black coat of the species most commonly seen is a gaudy mark and he is well known as a foe to the plant louse.

So what does it matter whether we call him bug or beetle if he does his work well, and how does it help us to get rid of the host of unfriendly insects and "sich," to call them by their right names? Not a great deal, perhaps, except that no two of them are just alike and it takes different kinds of poisons, or clubs sometimes, to kill.

One is much more apt to get the information if he can tell at least just how the damage is done and perhaps what the creature is when writing to the U. S. bureau of entomology, Washington; the University of California, Berkeley; the citrus experiment station, Riverside; the state department of agriculture, Sacramento; the county horticultural commissioner, the county agent, the nearest horticultural inspector, or the California Cultivator. Each will be able to answer inquiries or pass on to other experts who can. One does not need to know the color of its eyes nor its Latin name, but one does need to know whether it is a bug or a beetle.

True bugs obtain their food by piercing the plant with beak or proboscis through which they suck the plant juices, and for practical purposes they are classed as sucking insects. Those which bite and devour the foliage and other portions of plants are known as chewing insects.

Contact sprays, dusts or gasses must be used against the first class, while against the chewing insects internal poisons such as arsenicals are most effective.

In practice some which are not true insects are classed with sucking insects, as red spiders and mites, because they obtain their food in the same or a similar manner and are therefore not susceptible to internal poisons.

Likewise "sowbugs" and "thousand legged worms," though not true insects because they do not have six legs, are classed with the biting insects.

A list of the more common California forms susceptible to contact sprays would include the aphids or plant lice, leaf hoppers, mites, red spiders, thrips and the several scale insects. Arsenicals or other stomach poisons are effective against ants, cutworms, army worms, beetles, caterpillars, codling moth, grasshoppers and many others.

Someone has said that an airplane is nine-tenths operator and one-tenth machine; so it is with spraying. An efficient machine and properly mixed materials are necessary, but unless the application is made at the proper time and a competent operator handles the nozzle, the grower had better hire a small boy with a squirt gun.

To get the sucking insects the spray must reach every part of the tree. Contact spraying means "contact"; high pressure means greater distribution, hence a greater killing.

In applying internal poisons the same principle holds good: it must be thorough. It must be applied when the insect cannot avoid getting it with its food.

Then it is possible to apply poisons in dust. Big power blowers, also the hand or knapsack type, have been perfected and the distribution of a poison, sulphur, or nicotine is made sufficiently economical as to labor to make up for a slight loss in material.

Nor are our pest considerations confined to spraying or fumigating tops of trees and plants. With nematodes, wireworms, woolly aphis, phylloxera, fungous troubles, and on endlessly, there are soil pests. Can we reach these with gasses or chemicals? Anyway, we are most hopeful that with sulphur, carbon bisulphide or certain traps we may yet assure our under-the-surface enemies a warm or suffocating reception. Meantime let us know the game—it beats guessing.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

At the Panama-Pacific Exposition was a figure in bronze called "The Thinker." Illustrations of this figure have been used in season and out of season, for while there is crudeness in the execution it has a power of suggestion which makes it really fine art. This figure is now in Golden Gate Park.

* * *

An illustration of this figure would have been entirely in order on the cover page of this issue. There is no business which calls for more real constructive thinking than that of farming. It is a case of knowing the game and of eliminating all guessing.

* * *

And yet no form of question comes oftener to the Cultivator trouble-shooting department than that which shows the minimum of thinking before the question was asked. For instance, "How may I kill the bugs which are bothering me greatly." The majority of our growers, of course, either send specimens or definite information as to the plant or animal attacked and the type of insect, but all too often the observation is made that a tree is sickly and needs some attention. "What shall be done?"

* * *

Again, along another line. "My trees are looking sickly. What may I do to the soil to give me good crops?" The Cultivator is here to answer these questions and do its very best to secure help for the inquirer. Give us a foundation to render this service.

* * *

One feature of the fight on injurious insects, which is given hardly as much attention as it deserves, is that of biological control. By biological control we mean bug eat bug. Harry S. Smith of the state department of agriculture gives a most interesting account of one of the beneficial insects which is making life miserable for the black scale. Mr. Smith gives to this insect place of honor as most important parasite introduction of the past year. But we all may recall many other friends of California farmers which have been introduced through the efforts of the U. S. department of agriculture, the state board of horticulture, the horticultural commission or the present department of agriculture.

* * *

To Alexander Craw is doubtless due the honor of being the first to suggest this method of fighting fruit tree pests. Fortunately, one of the first efforts in this direction resulted in such a complete success than continuance of the work has been made possible. The life of the citrus industry was threatened by the cottony cushion or fluted scale, Icerya purchasi. Orange trees were dripping with honey dew and the offal of these pests. Sprays failed and gas fumigation was not yet a success, though it was already dreamed of. But Albert Koebele of the U. S. department of agriculture saved the day when he searched out and sent to the state vedalia cardinalis. It is probable there will never again be so complete a success as was secured by this little predacious insect, but it is felt that so far as black scale is concerned there have been sufficient insect enemies introduced that the time may be near when spraying or fumigation of that scale may not be necessary.

* * *

Speaking with George Compere recently as to the work of Albert Koebele, he remarked: "Do you know, California fruit growers would honor themselves by erecting some memorial in honor of his work."

* * *

And George Compere has done some scouting about the world, gathering in the bugs which should eat the other bugs. He is the oldest in service of the quarantine division of the department of agriculture. He began the work under Alexander Craw considerably more than a third of a century ago. It was he who brought to the attention of California fruit growers at the Stockton convention in 1910 the information that the Australian fruit fly was infesting the fruits of the Hawaiian Islands. This information made possible, even necessary, more stringent quarantine regulations which have made today's quarantine service so effective.

* * *

Speaking of the quarantine service: The other day we were in the office of George Compere at the head of the service in San Francisco. A gentleman entered, also in the service of the state, and he confided to George that he had a friend whose life could only be saved by a diet of papaya, and particularly one grown in Hawaii. Hawaiian papayas, by the way, are contraband. This particular fruit is relished by the Australian fruit fly as well as by some invalids in America. Some of these fruits have been found which were a mass of wriggling "worms." Notwithstanding this we were assured that this case was not the only one in which representative citizens have endeavored to "slip one over" on the quarantine service and get by with the contraband stuff. Compere was quick to come back with the suggestion that the greatest need on the part of all the invalids of San Francisco could not suffice to get one papaya through the Golden Gate.

* * *

One feature of value in impressing the need of thorough quarantine is the fact that California's alfalfa crop, of a value of some $7,000,000, grown on nearly 1,000,000 acres, will be seriously menaced if the alfalfa weevil ever gains access to the state. A measure of control may be secured by disking, dragging and spraying. While it costs only $2 after each cutting to spray each acre, the cost for 1,000,000 acres means a heavy addition to production costs, in other words, $2,000,000 added to our taxes, not annually, but for each cutting. Strength to the arm of our officials along our eastern border.

* * *

Beside the six-legged, there are some four-footed pests. Jacobsen is after them. The last session of the state legislature appropriated $50,000 to fight coyotes, bobs, mountain lions and a few other varmints. This money makes possible employment of 12 men working under the direction of Mr. Jacobsen. Some of them are employed by the U. S. biological survey; others by the state, these two forces often cooperating with the county in securing additional funds. Boards of supervisors are not only willing, but anxious, to cooperate with state and federal forces. This is especially true in sheep growing counties. This is the first really united effort which has been made to control these larger pests of the farm.

* * *

The greatest advancement in spray equipment during the past few years has been in securing more powerful spray pumps giving higher pressure. This was first called for by the spray gun. In order to be effective pressure sufficient to carry to greatest heights of trees was necessary. The pump manufacturers have met the need, and many pumps put up today are able to maintain a 300 pound pressure whereas formerly 200 to 225 was considered sufficient.

In fumigation the gas tight tent has come. "It is a complete success and makes fumigation more economical." "It is not a complete success for, as we proceed, we are learning that reduction in dosage is not possible, at least to the extent we had hoped." Take your choice from these two opinions, which may be had from some of our best fumigators.

* * *

Fumigation kill has not been as complete as desired, and today some sections are changing from liquid gas to the old-time pot method or fumigation machine work. In other sections the use of liquid gas is increasing. This seems to be a transition period; another year should show material advance in fumigation lines.

* * *

At the recent state fair there were five cheeses exhibited. Each one was made from 200 pounds of milk. The first contained five per cent of butterfat. It weighed 25.8 pounds. The next was made from 200 pounds of four per cent milk; it weighed 21.6 pounds. Others: 3 per cent milk, 16.6; 2 per cent, 12.5; skimmilk, 9 pounds. Bear in mind the total weight of the milk in each case was the same. It is to be noted that the butterfat had the capacity of carrying much more than its own weight into the cheese. We do not know how this is accomplished, but there is sufficient in these figures to show that the richer milk makes for greater profit and certainly greater satisfaction on the part of the consumer, hence increased consumption.

ACKNOWLEDGMENT

The California Cultivator owes much to many experts for assistance in compiling formulas and list of pests infesting many host plants, given in the following pages, especially to Prof. E. O. Essig who, when he was horticultural commissioner of Ventura County in 1909, aided materially in arranging the first pest fighting issue; to H. J. Ryan, horticultural commissioner of Los Angeles County, who has given much of his time in revising and suggesting changes, to Bean Spray Pump Co., Roy E. Campbell, U. S. D. A., Lee A. Strong of state department of agriculture, Fred K. Howard and A. W. Morrill.

Unfortunately, much of the material in hand for use in this issue is necessarily held over until the issue of October 8. This includes a large number of engravings, many of which were secured from the state department of agriculture.

THE SAN FERNANDO FAIR

By Ernest Braunton

THE fair is in full swing at San Fernando and on the day of writing (Tuesday) the attendance was very good, more than three times that of the first day. Three huge tents divide the indoor exhibits into soil products, machinery and livestock, the latter from pigeons and chickens to horses, cattle, hogs, sheep, goats and everything that contributes to the human food supply, comfort or companionship.

In the "tent of crops" may be seen everything that California can grow in the soil, beneath the soil or above the soil, for San Fernando Valley grows it all through the alphabet from alfalfa and avocados to watermelons, yuccas and zinnias. Every district and town has its booth in which is displayed the earth's best. The more distant Antelope Valley has a fort-like booth built of baled alfalfa and filled with fruits, vegetables and grains. As one enters the huge tent this fodder fort confronts him, and on the right Lankershim commences with 24 boxes of apples, followed by pears, other fruits, vegetables, grains and so on to the end of possibilities, and where this ends another town or section attracts and interests the visitor until he finds himself back at the fort. Then he has to make the rounds of the interior booths, of which there are scores.

The department of public service of Los Angeles has a miniature reproduction of municipal power plant No. 1, with plane grounds about it. But the best, most educative feature, is the booth of the Los Angeles County horticultural commission. To list and describe all therein contained would require a page, but everything there displayed should be seen by each tiller of the soil and by all interested in agricultural problems. Beneficial and injurious insects, animals and reptiles, diseases affecting trees, plants, fruits and vegetables, pernicious weeds, falsely and poorly packed products, with illustrations and examples of how things should be done rightly is an exhibit that Commissioner Ryan may well be proud of.

Quarantine on the Coast

By Lee A. Strong

PLANT quarantine enforcement has been brought to a higher degree of efficiency and popularity the past two years than any similar period in the history of such work.

The farmers, nurserymen, florists and fruit growers of California are and should be intimately concerned and in sympathy with the work and developments of the three major organizations having for their function the protection of the agriculture and horticulture of California, the West and the United States, namely: The bureau of plant quarantine of the California state department of agriculture, the western plant quarantine board and the federal horticultural board. The achievements of these organizations are the more apparent when we consider the problems which have arisen and which have been satisfactorily cared for during the period mentioned, for at no time have conditions called for a greater exercise of judgment and efficiency.

With the discovery of the alfalfa weevil in Nevada, a few miles from California, the California department of agriculture was faced with the necessity of adopting more comprehensive measures for California's protection. The weevil having crossed what had been considered almost impassable natural barriers in the form of desert and mountain ranges, it was immediately realized that quarantine regulations which had been adequate to control commodities carried by common carriers were inadequate to cope with the situation brought about by the presence of the weevil in Nevada. Director G. H. Hecke at once wrote a new quarantine order which was promptly signed by Governor Stephens. This order provided authority to carry on the inspection of the personal belongings of automobile tourists, recognized as being the greatest danger in the possible introduction of the weevil into California. Subsequent inspections of automobiles have, in the finding of many species of insects, among them live alfalfa weevil, demonstrated the wisdom of inaugurating this work and the importance of continuing it.

With the resumption of foreign trade and foreign travel following the war the plant quarantine work at the maritime ports has increased by leaps and bounds. More agricultural products are offered for entry and more passengers arrive from ports in other countries where fruit flies and many other pests exist. The finding of fruits from Hawaii infested with Mediterranean fruit fly, oranges from Mexico infested with the Mexican orange maggot and citrus from the Orient infected with citrus canker are not rare but common occurrences.

The western plant quarantine board, formed at the fruit growers' convention at Riverside in 1918, held its annual convention in British Columbia in June of this year. The membership is made up of the quarantine officers of the 11 western states, Hawaii, British Columbia and Lower California. The object of the organization is the uniform enforcement of quarantine regulations for the protection of the agriculture of the west and the promulgation of just and equitable quarantines after full and thorough joint consideration. Under the leadership of G. H. Hecke, who was chairman of the board the past two years, a more practical and uniform procedure in quarantine matters has been developed throughout the west.

On June 1, 1919, Quarantine No. 37, promulgated by the federal horticultural board, became effective. The object of this quarantine was to correct a condition which had for years been a menace to the agriculture and horticulture of the United States. Until Quarantine No. 37 became effective the United States was used as a dumping ground by all the foreign shippers of plants and nursery stock who had inferior and infested stock to dispose of. No. 37 prohibited the entry of all stock which could be produced in the United States and regulated the entry of novelties, necessary propagating stock, etc. In the early days of the quarantine much criticism was directed at the board, but after a two-year trial, the wisdom of the action of the board has been proven and those in the United States who are truly interested in the development of agriculture and horticulture realize that a long step forward has been taken in practical protective measures. California is directly benefited by close cooperation with the federal horticultural board, the state department of agriculture enjoying the full and hearty support of the board.

A Phase of Biological Control

By Harry S. Smith, State Department of Agriculture

I HAVE been asked to write a brief article on "The Greatest Recent Advance made in Biological Control of Pests of Farm and Orchard Crops." Since the article apparently is to refer to California I have no hesitancy in designating for this honor the introduction into California of the black scale parasite, Aphycus lounsburyi. As everyone connected with the citrus industry knows, the black scale is the most costly pest of citrus with which we have to deal. During the past season there was expended in Los Angeles County alone for fumigation nearly a million dollars, the greater part of which was directed against this pest. Any method of control, therefore, which will tend to reduce this enormous cost is of greatest concern to the growers. J. D. Culbertson, of the Limoneira Company at Santa Paula, where the original colonization of aphycus took place, stated recently at the Lemon Men's Club that the introduction of this parasite had reduced the cost of the black scale control on their properties in 22 months from $10,227.71, the cost for 1919, to practically nothing for the present season. From there the parasite has been distributed rather generally throughout Ventura County and other ranches are now beginning to show parallel cases of effective work by this valuable insect. In fact, it would not be at all surprising if fumigation for the black scale in the larger part of Ventura County would soon be a thing of the past.

Beside the state department of agriculture and the Limoneira Company, several other organizations were quick to recognize the possibilities of aphycus in reducing the cost of black scale control. The Santa Paula Citrus Association several months ago built a model insectary and has gone into the business of propagating and distributing this parasite extensively on the properties of their members. The Ventura County horticultural commissioner has also made extensive colonizations in various parts of his county. The California Fruit Growers' Exchange during the past season has distributed in southern California approximately 200,000 of the parasites, the colonies being located in practically all of the citrus districts. The Los Angeles County horticultural commissioner has also taken part in the distribution work and several local associations are contemplating the building and operation of insectaries for service to their growers. Thus it will be seen that the aphycus is to be given all necessary attention in the way of getting it established throughout the citrus growing areas of southern California.

The introduction of this parasite from Australia and South Africa by the state department of agriculture is without question the most important event in biological control work in recent years. Already it has been instrumental in the saving of many thousands of dollars and what its future will be no one can foresee, but it is bound to become a factor of greatest importance in reducing the cost of production of citrus fruits in California.

State and Federal Quarantine

By C. B. Messenger

THE farmer, whose failure of crops has been traced back to its source and found due (as it so often is), to insect or fungus pests, may wonder if there are any in the world which he has not already had to contend with. A visit to one of the quarantine stations at San Frencisco, Los Angeles or San Diego will show him that there are still pests he knows not of and of which we hope he never will know. Another line of defence (a rather thin one, we admit) is maintained in the mountains along our eastern border to keep out the pests from other states, and while we feel we have some of the worst pests the earth has yet produced, many others are declared to be infinitely more destructive. For instance it has been stated that the Australian fruit fly, if it once gains foothold in California orchards, will mean practically the abandonment of fruit growing. Such surely will be the case unless American ingenuity can devise means for its control. State and federal quarantine officials have fullest appreciation of this fruit tree menace and the watch is kept day and night at ports of entry.

When a vessel from a foreign port passes the Farallones quarantine officials, whose offices are in the Ferry Building, are notified of its approach, when it passes through the Golden Gate the quarantine officials go to the dock where the customs launch is waiting to take them to the quarantine anchorage near the station on Angel Island. They are not admitted to the incoming vessel until the port doctor has made examination of the vessel and the yellow, or quarantine, flag is lowered. Then both customs and plant quarantine officials begin to make their examination of pantry, galley, cold rooms, staterooms occupied by passengers, and, finally, of the baggage of every passenger. Every vessel has its passenger who is bringing home some choice foreign fruits, plants, or some other possibility of pest introduction. Many have plants or fruits not contraband, and in any case, much explanation is necessary in order to save hard feelings but if confiscation is necessary the inspectors are relentless in the hold they maintain on the contraband.

The quarantine offices have for many years been gathering in specimens of fruit flies, beetles, weevils and fungous troubles without number, and California orchardists may well feel satisfaction in knowing they are safely impaled on a pin in the collectors' cases in-

(Continued on Page 322.)

Agricultural News Notes of the Pacific Coast

Northern California

Chico state normal school opened September 12.

"Colusa County Day and School Day" at the Arbuckle almond fair September 30.

The Hayward Poultry Producers' Association held its quarterly meeting September 10.

A shipment of Tokay grapes was sent last week to Liverpool, and another to Havana.

Report has been received that the supreme court has reversed river injunction asked by Antioch.

Farm center meetings in Shasta County: Fall River, 4; Mountain, 25; Millville, 27; Palo Cedro, 28.

Arbuckle is preparing for its almond show beginning tomorrow, Sept. 28, and lasting to October 2.

The 1920 prune crop has been practically cleaned up, says Manager Reynolds of the Chico plant of the C. P. C.

Manager Risser of the California Vegetable Union says that the sweet potato crop will be very short this season.

In the poultry, pigeon and pet stock show at the state fair there were 1688 entries and at all times a crowded exhibit room.

C. R. Thomas is in charge of the California National Livestock Association Show to be held at San Francisco October 22-30.

Foresters are examining the cattle ranges near Salmon Forks in the Klamath forest. Rangers' headquarters are at Sawyer's Bar.

Tehama County farm center meetings: Liberal, September 22; Bowman, 24; Los Molinos, 26; Directors Red Bluff, 24, 10:30 a. m.

The El Dorado County farm bureau exchange is successfully operating a fruit evaporator at Placerville and a meat packing plant at El Dorado.

A wonderful showing of goats was made at the state fair. Goat's milk was third at the booth of the Central California Milk Goat Breeders' Association.

The Poultry Producers of central California in reporting July shipments find that there were 42 per cent more shippers than during the same month last year.

Frank W. Morris of Woodland was re-elected president of the California Holstein-Friesian Association at the annual meeting held at Sacramento during the state fair.

Nearly 3000 cattlemen of Humboldt County gathered at Fortuna Park September 3 for their annual meeting and picnic. There were many visitors from Trinity County.

Alameda County expects to harvest its largest sugar beet crop amounting to 40,000 tons. The Alvarado mill expects to handle 100,000 tons shipped in from other sections.

President Inman of the Pacific Rice Growers says that the general harvest in the Sacramento Valley will commence the last of September. 140,000 acres will be harvested this season.

Guernsey Breeders of California held their annual dinner at Sacramento state fair week. W. H. Saylor of San Francisco was chosen president and D. O. Brant of Owensmouth secretary-treasurer

Central California

There is a strong eastern demand for prunes.

Deer are reported to be plentiful in the Sierras.

Watsonville is planning another big apple show in October.

The picking of Bellflower apples has begun in the Watsonville district.

A new cheese factory is to be located at Oakdale, Stanislaus County.

There will be a farm bureau hog auction sale at McFarland September 30.

Fresno County fair opens next Monday, September 26, and closes October 1.

Tourist travel to Inyo County has been heavier this summer than ever before.

Kern County won third for mineral display at the state fair at Sacramento.

Watsonville, Santa Cruz County, had shipped to date of September 10 468 carloads of fruit.

The chamber of commerce of Lindsay, Tulare County, is planning a small farms campaign.

There was an attendance of over 500 at the county farm bureau picnic at Merced, September 7.

The Elkhorn Ranch of Watsonville, Santa Cruz County, brought home a number of blue ribbons from the state fair.

Stanislaus County reports its grape crop about 60 per cent that of last year, the decrease being due to severe frosts.

The Kerman chamber of commerce is working to secure a packing house of the Associated Raisin Company at Kerman.

The California Alfalfa Growers Exchange reports many sales of chopped alfalfa for fertilizer at $20 a ton grove delivery.

The Kerman News reminds raisin growers that it will soon be time to clean up the old paper drying trays in the vineyards.

A well sunk by the Simon Newman Company in the foothills west of Newman, Stanislaus County, has found a good flow of water.

15,000 acres of new vineyards have been set out in Merced County during the past few years, most of it in the Livingston district.

One effect of the carload shipments of figs to New York has been the strengthening of the San Francisco market. Fig shipments will continue throughout the month.

The Farmers Union of Stanislaus County held its annual picnic at Tulare on September 17. Need of organization of the melon growers was the principal subject discused.

The West Joaquin irrigation district is conferring with Miller & Lux as to organization of a district under the new water storage act to include all the land of the corporation along the San Joaquin River with the proposed West Joaquin district.

Governor Stephens has named W. P. Boone of Dinuba and D. J. Coyne of Los Angeles as executive directors to serve with State Engineer W. F. McClure in the administration of the new California water storage district act.

Southern California

Paderewski has sold his Rancho Ignacio at Paso Robles.

Shipment to San Francisco of Coachella dates sold at 45 cents a pound.

Yucaipa Valley, San Bernardino County, has begun carload shipment of apples.

The Southern California farm bureau egg laying contest begins at Pomona October 1.

San Dimas is shipping about two carloads a day of Valencias and three of lemons.

Yucaipa Valley, San Bernardino County, will hold its annual apple festival Oct. 7-8.

Orange County walnut packing houses are being made ready for the packing season.

Grapefruit growers of Imperial Valley are planning to organize a marketing association.

The cotton gin at Seeley, Imperial Valley, will open within a few days on Pima cotton.

Oxnard bean growers say that their bean fields have suffered somewhat from hot weather.

The Walnut Growers Association will meet in Los Angeles September 28, when prices will be discussed.

The National Orange Show at San Bernardino has received $1,547.50 as premium money from the state allotment.

The annual meeting of the Los Angeles County farm bureau will be held at Ganesha Park, Pomona, September 28.

The Imperial Valley Vegetable and Melon Growers Association, is launching a drive to increase its membership.

Manager Thorpe of the California Walnut Growers Association says the crop will be about the same as that of last year.

The San Bernardino Farm Loan Association expects an allotment of funds from the federal land bank at Berkeley some time this month.

The Palo Verde chamber of commerce is laying special stress in its advertising on the value of that section for dairies and vineyards.

Large quantities of dry orange peel are used in the manufacture of tobacco products, especially plug tobacco. Much also is used in mince meat.

The Imperial and Coachella Valley irrigation districts recently held a joint meeting to investigates the Boulder dam and all-American canal project.

The management of the Southern California fair to be held at Riverside, October 11-16, announces that more than 1500 birds will be entered in the poultry show.

Farm bureau center meetings will be held in Los Angeles County at Burbank, September 26; Littlerock, 27; annual meeting, Pomona, 28; Del Sur, 28; Downey and Glendora, Oct. 3; Alhambra, 4; Zelzah, 5; Lankershim, 6; San Fernando and Whittier, 7.

Alfalfa growers in the Imperial Valley have shipped nearly 100 carloads of alfalfa to San Diego, and plans are now under way to make water shipments by way of Panama to Eastern cities where they expect to get prices high enough to cover charges for the long transportation.

The Coast and General

Northern Arizona reports light frosts.

Marion County, Oregon, will harvest an 800 ton crop of flax this season.

Alfalfa fields in the Yuma Valley of Arizona are ready for a second cutting for seed.

Efforts will be made to hold a poultry show at Phoenix this winter, probably in December.

A Salem, Oregon, concern has contracted for sale of 150,000 pounds of dehydrated pumpkin.

Frosts in April and May and drouth in June have practically destroyed the fruit crops in Holland.

The Fruit Growers Association of Eugene, Oregon, has packed over a million pounds of cherries this summer.

The dairy department of the Oregon agricultural college is exhibiting 34 head of dairy cattle on the fall fair circuit.

The state fair of Arizona is not to be held this year, owing largely to the fact that the mines of the state are for the most part inactive.

Seven hundred miles of Maricopa County, Arizona, roads were graded after the rain of the latter part of August. Caterpillar tractors were used.

During the high water due to heavy rains the members of the Salt River Valley Water Users Association were served water free of charge.

The Prescott national forest reserve in Arizona is sending out notice to all permittees, extending the time for payment of grazing fees to December 1.

Additional evidence of increased interest in dairying in Arizona is the purchase by an Arizona breeder of the pure bred Guernsey bull, May Fly of Beaver Ridge.

The harvesting and processing of sea weed has become an important industry in Holland. Shipments are made to Belgium, England and France and occasionally to the United States.

Several hundred bales of No. 2 Pima Egyptian cotton have been sold recently at 26 cents a pound. Cotton dealers believe that the demand is likely to increase to an extent that will open up the market within a short time.

The Arizona livestock sanitary board is urging stockmen to vaccinate against blackleg, claiming that the recent heavy rains which have changed conditions from scant feed to one of plenty, make favorable spread of the disease.

Very heavy rains throughout a good portion of northern Arizona during the last 10 days of August have greatly improved range conditions and insured adequate stock water until the winter rains come. Livestock losses from now on should be small.

A poultry association has been formed in Pinal County, Arizona, known as the Florence Poultry Association. Meetings and culling demonstrations are being held throughout the Florence and Casa Grande Valleys. It is claimed that poultry products have created more wealth in the Casa Grande Valley than any other single product.

Poisons and Preventives for the Ever Present Pests

FUNGICIDES

1. Commercial Bordeaux Mixture

Several preparations of this sort are on the market in the form of a paste or dry powder to be diluted with water. Objection is sometimes made to these preparations that they will not remain in suspension in water as well as the home-made Bordeaux mixture, but some of them are probably as good or better than the average mixture prepared on the ranch. The commercial preparations are slightly expensive but more convenient for use, and are especially of interest to the small grower.

2. Bordeaux Mixture

The formula ordinarily used, the 5-5-50, is entirely harmless when the plant is dormant. It may also be used on some growing plants; others it will kill or greatly injure. It may be used even stronger than the formula given when the plant is dormant, but these proportions are effective with most fungus troubles. By the 5-5-50 formula is meant:

(a) Copper sulphate	5 pounds
Stone lime	5 pounds
Water	50 gallons

The weaker solution is

(b) Copper sulphate	3 pounds
Stone lime	5 pounds
Water	50 gallons

If hydrate of lime is used add one-fourth more.

To mix, dissolve the copper sulphate with water in proportion of one pound of sulphate to sufficient water to make one gallon of solution for each pound of sulphate used. The stone lime may be slaked and dissolved in water in the same proportions as the sulphate. This gives convenient stock solutions, every gallon of which contains one pound of lime or of sulphate. To make the mixture from these stock solutions take, say, for the formula (a) above, five gallons of the lime solution which will contain five pounds of stone lime and five gallons of the sulphate solution which will contain five pounds of copper sulphate. Five gallons of each of these two solutions may now be mixed with water by pouring simultaneously through a strainer into water sufficient to make 50 gallons. Do not mix the solutions before pouring into the water.

3. Bordeaux Paste

The best cure for gum disease.

Bluestone	1 pound
Fresh burned lime	2 pounds

Dissolve the bluestone in three quarts water, using wooden or earthen vessel, by hanging it in a sack near the top of the water; slake the lime in about three quarts water. Stir together when cool, making a mixture about the consistency of whitewash. Apply with a brush. May be applied to healthy bark as a preventive. Mix fresh each day or two.

4. Bluestone Copper Sulphate

A soluble compound of copper, the raw material for the preparation of most other compounds of copper. This cannot be used on foliage. For dipping grain use:

(a) Bluestone	1 pound
Water	4 gallons

Dip for 3 minutes. Follow by dipping in:

(b) Quicklime	1 pound
Slaked in water	10 gallons

5. Bluestone for Wash Water

Bluestone	1½ pounds
Water	1000 gallons

6. Sulphur

For dusting upon plants for the control of surface mildew, red spider, or other parasites, the fineness of the sulphur is an all important consideration. Flowers of sulphur, the finest and fluffiest grade of sublimed sulphur, has been heretofore recommended for application as a dust. At present, however, there are upon the market several brands of extremely finely ground sulphurs which are finer than the best grade of sublimed sulphur and no more expensive. Some of these sulphurs, which have been specially prepared for dusting, are ground to pass a 200-mesh bolting cloth. These are apt to cake or clog the dusting apparatus. If three parts of sulphur are thoroughly mixed with one part of hydrated lime, kaolin, or other inert powder, these difficulties may be avoided.

7. Corrosive Sublimate (Mercuric Chloride)

Mercuric chlordie (corrosive sublimate) is used for treating seed potatoes and cabbage seed for diseases. It may be purchased at drug stores in the form of tablets costing about 25 cents for 24. Dissolve two large tablets in a quart of water to make a 1 to 1,000 solution. For larger quantities use 2½ ounces to 15 gallons of water. Corrosive sublimate is a deadly poison. It attacks metals and therefore must be used only in a wooden, glass, or earthenware vessel.

8. Formaldehyde (Formalin)

Formaldehyde (formalin) is used for treating seed potatoes, seeds, and soil, to prevent diseases. This is a clear solution of 40 per cent formaldehyde gas in water, which retails at about 50 cents per pint. It is very irritating to the eyes and to cuts, but not poisonous. It does not attack metals. Use 1 teaspoon to a teacup of water, 1 ounce to 2 gallons of water, or 1 pint or pound to 30 gallons of water (for potatoes and onions). It is not an insecticide.

CONTACT INSECTICIDES

The lime-sulphur wash is usually considered an insecticide. It is, however, an excellent fungicide, though where a fungicide only is desired Bordeaux is usually preferred. At full strength it may be used only when trees are entirely dormant.

9. Commercial Lime-sulphur Solution

The growers of the state are being supplied with concentrated commercial lime-sulphur solution of good quality and at reasonable prices. The great bulk of this important pest remedy used in the state is therefore of commercial manufacture, testing between 32 and 34 degrees Baume. It is only necessary to dilute with water before spraying.

For spray on dormant trees dilution of commercial solution is usually at the rate of 1 part commercial mixture to 9 parts water. As a summer spray or when used on trees in full leaf use at rate of 1 to 33.

10. Home-made Lime-sulphur Solution

Stone lime	50 pounds
Sulphur (sublimed or powdered)	100 pounds
Water to make	50 gallons

Heat in a cooking barrel or vessel about one-third of the total volume of water required. When the water is hot add all the lime and at once add all the sulphur, which should previously have been made into a thick paste with water. After the lime is slaked another third of the water should be added, preferably hot, and the cooking should be continued until a clear orange colored solution is obtained (usually 45 to 60 minutes), when the remainder of the water should be added either hot or cold as is most convenient. The boiling due to the slaking of the lime thoroughly mixes the ingredients at the start, but subsequent stirring is necessary if the wash is cooked by direct heat in a kettle. After the wash has been prepared it must be allowed to settle and then be strained through a fine sieve as it is being run into the spray tank. The resultant product is a concentrated solution of lime-sulphur, which should be diluted about six times with water for a winter spray.

11. Sulphur Compounds

For various reasons it is often desirable to mix sulphur and water and apply to plants as a spray. Sulphur, however, is not easily wetted with water and it is a difficult matter to make a uniform mixture of the two. It has been found that a number of substances, soap, glue, dextrin, etc., when mixed with water and sulphur, have the property of counteracting the natural aversion of sulphur to water. Certain of these substances have been used in the preparation of commercial sulphur pastes. These commercial pastes, as now manufactured, contain from 45 to 50 per cent of sulphur in a very finely divided condition, the remainder being water and one of the substances mentioned above. The effect of these pastes is that of dry sulphur. The usual strength to use is:

Commercial sulphur paste	8 to 21 pounds
Water	100 gallons

12. Resin Wash

Resin wash is used extensively as a dip for nursery stock and as a spray for young citrus trees. It is an effective scale killer but is not recommended for use when a crop is on the trees, as it has a tendency to stain the rind and spoil the appearance of the fruit.

Commercial resin wash may be purchased or it may be made according to the following formula:

Resin	20 pounds
Caustic soda (76 per cent)	6 pounds
Fish oil	3 pounds
Water	100 gallons

Put resin, lye and fish oil, with sufficient water to cover them well, into a large iron kettle and heat until all are well mixed and thoroughly dissolved. Add cold or hot water to make when finished 100 gallons of spraying material. This is one of the oldest sprays and very adhesive.

13. Kerosene Emulsion

Kerosene or petroleum distillates are often used most effectively. There are conditions where greatest care must be observed. For instance, on excessively hot dry days there is danger of either tree or fruit injury. Some experiments with these oils have appeared almost foolhardy but at the same time have accomplished results. For instance, in the California Cultivator of March 22, 1919, page 409, Mr. Calkins referred to spraying pure kerosene over trees infested with woolly aphis and pouring over a quart of the oil about the stripped roots and covering immediately with earth. In citrus orchards especial care must be observed during the hot weather. In the form of emulsions the distillate or low grade kerosene sprays are safer but even then do not allow large quantity to run down trunk and saturate the bark.

Kerosene	15 gallons
Liquid soap	¾ gallon
(Or hard soap)	4 pounds
Water	200 gallons

If liquid soap is available, it is preferable to hard soap, since no heating is required. Hard soap, preferably fish oil, is cut in thin slices and dissolved in hot water. The soap is placed directly in the spray tank with 10 to 15 gallons of water or more (the exact amount is not important), and then the engine is started. The oil is now added slowly, and the materials are emulsified by being run through the pump under pressure. After a few minutes the rest of the water may be added, and the spray is ready to apply to the trees.

14. Crude Petroleum

The use of crude petroleum is almost entirely limited to the winter spraying of deciduous trees when the buds are entirely dormant. It is generally applied from November to February. The crude oil emulsion is especially recommended for black scale (Saissetia oleae), European fruit Lecanium (Lecanium corni), European or Italian pear scale (Epidiaspis piricola), cherry scale (Lecanium cerasorum) and other scales infesting deciduous fruit trees. It is practically the only spray treatment which has been effective against the European or Italian pear scale and, to a certain extent, will destroy the winter eggs of many of the aphids, red spider, and some of the defoliating caterpillars.

When crude oil is thoroughly applied it sometimes penetartes the fruit buds to a considerable extent, some of which may be injured and even killed. The great majority of the buds are not injured, however, but appear to be stimulated to a more vigorous growth, producing a character of foliage which withstands attacks of diseases. It is good practice, especially in dry seasons, not to apply crude oil emulsion until there is an indication of the swelling of the buds.

A natural crude petroleum, testing about 23 degrees Baume, is preferred as it contains some of the lighter and more penetrating oils. Heavier crudes than this have given satisfactory results, even those testing 18 degrees and even lower. Residuum oils (the residue of crude petroleum after the lighter portions have been distilled off) can be used if natural crude oil is unobtainable, provided their content of asphaltum is not too high to prevent their emulsification.

Water	175 gallons
Liquid soap	3 gallons
Natural crude petroleum (21-24 degrees Baume)	25 gallons

Partly fill the spray tank with water, add the liquid soap, agitate thoroughly for one minute, add crude oil and continue the agitation, while running in the remainder of the water. If liquid soap cannot be obtained, use 20 pounds of fish-oil soap dissolved in 10 gallons of boiling water to which 3 pounds of caustic soda or lye have been added. To kill moss or lichens on fruit trees add 2 pounds of caustic soda or lye to the formula.

During the spraying operation this emulsion should be thoroughly agitated and great care taken to wet all of the twigs. From 8 to 10 gallons should be used on a tree.

15. Distillate Emulsion and Tobacco Extract

Water	12 gallons
Fish oil soap	30 pounds
Distillate (32 degrees-34 degrees Baume)	20 gallons

The above emulsion is prepared in the ordinary way as a stock solution. For use in the orchard dilute 1 to 20 parts of water. To every 200 gallons of this diluted spray add 1 pint of tobacco extract containing 40 per cent nicotine, or about 3½ gallons of tobacco extract containing 2¾ per cent nicotine.

16. Nicotine Sulphate

Nicotine sulphate is a popular spray for the control of aphids on all sorts of plants. It is efficient and safe.

The following nicotine sulphate formula is recommended for aphis on truck crops:

Nicotine sulphate (40 per cent)	⅜ pint
Soap (dissolved)	2 pounds
Water	50 gallons

This gives 1 part of nicotine sulphate to 1000 parts of water. On some plants with smooth foliage more soap will be needed. If the spray draws together in drops and leaves part of

COMMERCIAL SPRAYS ARE GOOD AND ECONOMICAL

We call attention of users of sprays, dusts, or gases to those which are commercially prepared. Many of the largest users have found these mixtures, compounded by experts in chemistry, more effective and often more economical than the home made. The grower may depend on these tested and proven mixtures, many of which have been on the market for years.

The formulas given in this issue of the California Cultivator are old and tried and have been found most effective. Most of them are for mixing on the farm or in the orchard when ready to use. They are given so that the producer who may not be within reach of ready-to-use commercial mixtures still has information at hand to guide him in the use of simple chemicals

the foliage dry more soap should be added.

COMBINED INSECTICIDES AND FUNGICIDES

Owing to economy of application of combined insecticides and fungicides, Bordeaux is sometimes mixed with acid lead arsenate, basic lead arsenate, Paris green, concentrated tobacco preparations or sulphur. Lime-sulphur solution may be combined with basic lead arsenate, tobacco infusions or concentrated preparations. There are likewise antagonisms between other chemicals. This whole subject has been fully treated in Circular 195, published by the experiment station, Agricultural College, Berkeley.

17. Arsenate-Sulphur

(a) Acid arsenate of lead	8 pounds
Milled or atomic sulphur	5 pounds
Dilute Bordeaux mixture to make	100 gallons

Where apple scab is not a factor use water instead of Bordeaux.

First spraying, to be applied just as the blossoms are falling or in full bloom, according to locality.

Second spraying: apply ten days to two weeks after the first spraying.

(b) Neutral arsenate of lead	6 pounds
Milled or atomic sulphur	3 pounds
Water	100 gallons

Third spraying. Repeat the second spraying formula in about three weeks.

If it is desired to control aphids add one to two pounds of 40 per cent nicotine sulphate.

18. Bordeaux-Arsenate of Lead

Neutral lead arsenate	3 pounds
Bordeaux mixture	50 gallons

Where a stronger poison is desired the arsenate of lead can be increased to four pounds. A more uniform distribution of the arsenate of lead is secured throughout the spray when it is added to the milk of lime instead of placing it in the spray tank.

POISONS FOR CHEWING INSECTS

Lead arsenate (basic or neutral form) is generally used for leaf eating insects, as there is little danger of foliage injury with it. Paris green and white arsenic are used in baits for grasshoppers and cutworms.

The lead arsenates are sometimes sold as a paste containing about 50 per cent of water, or as a dry powder. The paste should be thinned somewhat with water and worked into a smooth cream before adding to the spray tank. The powders may be added directly to the tank and mixed by means of the agitator.

19. Arsenates

Acid Lead Arsenate (Lead Hydrogen Arsenate, Di-Lead Arsenate, often labeled "Standard" or Lead Arsenate. The acid type of lead arsenate contains more poison per pound than the basic type and is a stronger and quicker acting poison. In the moist climate, however, some of the arsenic is apt to be dissolved and cause serious foliage injury. It is not considered as a safe arsenical for use on stone fruits, beans or other susceptible plants.

(a) Acid lead arsenate paste	4 to 8 pounds
Water	100 gallons

Basic Lead Arsenate (usually labeled "Tri-plumbic" or "Neutral." The basic type of lead arsenate contains less arsenic per pound than the acid type, and is a weaker and slower acting poison. It is considered the only safe arsenical to use on stone fruits, beans or other susceptible plants.

(b) Basic lead arsenate paste	5 to 10 pounds
Water	100 gallons

Dry or powdered lead arsenate contains twice as much arsenic as the paste, therefore use only one-half as much in the above formula.

20. Zinc Arsenite

This is a more active and stronger poison than either type of lead arsenate and is useful in controlling the various caterpillars which are troublesome on pears and apples in the early spring, but is very apt to cause injury if the application is made after the time of full bloom.

Zinc arsenite powder	3 pounds
Water	100 gallons

20 (b). Arsenate of Lead for Alfalfa Weevil

Dry arsenate of lead	2 pounds
Laundry soap (not too caustic)	2 pounds
Water	100 gallons

Liquid soap may be used to induce "spreading," but owing to the great variation in liquid content of the soap we can only say use quantity which secures best results.

21. Poison Bran Mash

White arsenic (arsenic trioxide) is only sparingly soluble in water, although sufficiently so to prohibit its use on plants as an insecticide. Its use as a stomach poison is therefore limited to the preparation of poison baits for the control of grasshoppers, army worms, cutworms, etc., and in some other cases where the insecticide is not to be applied to growing plants.

Bran	25 pounds
White arsenic	1 pound
Molasses (cheap blackstrap preferred)	2 quarts

Mix the arsenic and the bran dry, and add the molasses which has been diluted with water. Add enough water and mix thoroughly to make a dry mash which will broadcast easily.

22. Citrus Bran Mash

White arsenic (or Paris Green	1 pound ½ pound)
Molasses (cheap blackstrap preferred)	2 quarts
Lemons (or oranges)	6 fruits
Water (about)	4 gallons
Bran	25 pounds

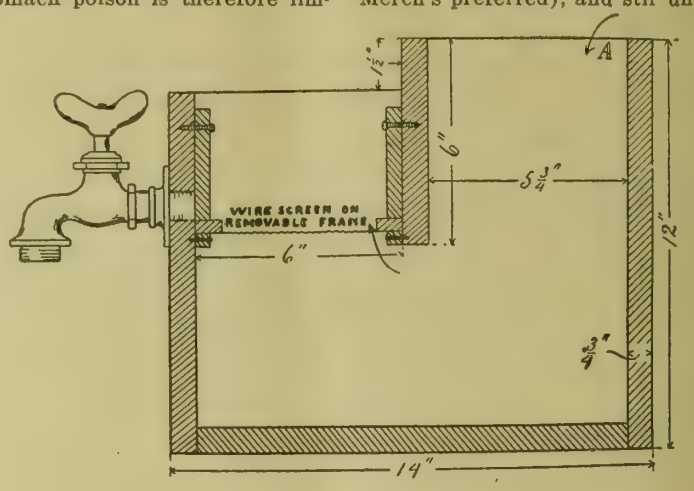
Mix the above materials as follows: Stir thoroughly the white arsenic, molasses, and water first. Grind the lemons, including the rinds, in a meat grinder, or chop fine, and add to this liquid. Then slowly pour this over the bran and stir thoroughly until an even mixture is secured.

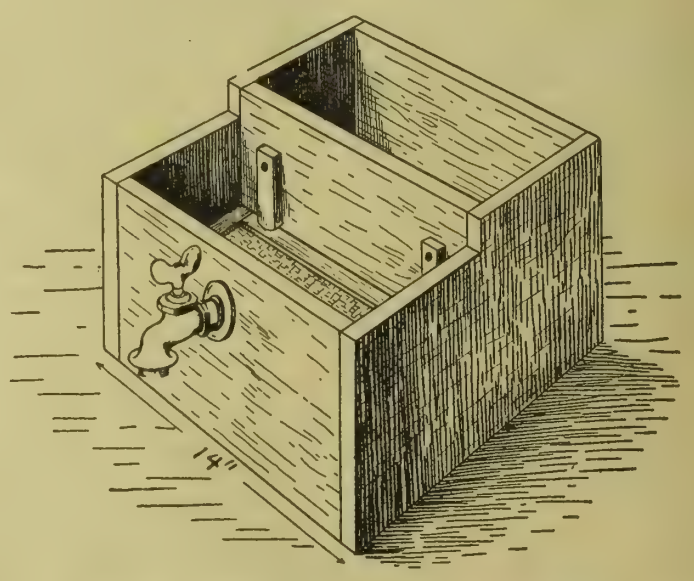
The amount of water to use in the preparation of these baits will vary according to the coarseness of the bran or substitutes. A dry mash is preferable to a wet mash because it does not harden under the heat of the sun and remains palatable, while wet mash becomes baked and unattractive. Distribute in small quantities early in the morning.

23. Argentine Ant Syrup

Place ten pints of water in a suitable container over the fire (gas heat peferred) and heat until lukewarm.

Drop in ¼ oz. tartaric acid (crystals) and stir until dissolved. Add nine grams of benzoate of soda and stir until thoroughly dissolved. Now slowly add 12 pounds of granulated sugar—stirring constantly until dissolved. Measure height of liquid in container as accurately as possible. Place cover on container and bring to a boil over a moderate fire. Boiling is to continue for 40 minutes over a slow fire—adding water to equal evaporation at the end of each 20 minutes. After boiling is complete set syrup to cool. To one pint of lukewarm distilled water add ¾ ounce of sodium arsenite (chemically pure, Merch's preferred), and stir until completely dissolved. Add poison solution to sugar syrup and stir well. Add two pounds of strained honey and stir well. The syrup is now ready for use but if not used at once it should be stored in tightly corked glass receptacles. The formula makes approximately 2½ gallons of poisoned syrup. Follow exactly as to proportions and directions. A two ounce flat top spice tin is preferred for putting out poison.





Stewart's strainer. The sediment collects below the screen instead of on it and does not fill up the screen

In the making of formulas Nos. 1, 2, 3, 10 and others given on Page 313 straining of solutions is necessary. A strainer constructed as above is best.

24. Tartar Emetic for Ants

Simple formula recommended by J. B. Neff:

Tartar emetic the size of a lima bean in three tablespoons of honey. Mix and place in two or three saucers and place where ants are proving troublesome.

DUSTS

26. Lime and Sulphur

Sulphur in powdered form is employed for the destruction of red spider and other mites on plants in foliage. Commercial ground sulphur may be used and, if finely powdered, will be as effective as the more expensive flowers or sublimated sulphur. The sulphur may be used pure or diluted with equal parts of a carrier such as hydrated lime, gypsum, flour, etc. Small hand dusters are available for

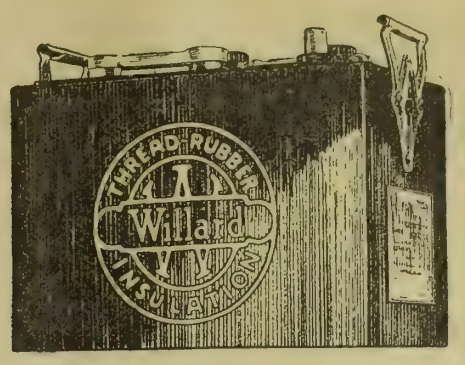
Willard Threaded Rubber Insulation = Insulation + Porosity + Durability



The Thread-Rubber trade-mark tells you that the plates in your battery are *insulated*—not merely *separated*. Willard Threaded Rubber Batteries are selected by the best brains in the automobile business as standard equipment for 184 makes of cars and trucks.

Willard, in the search for a substance which would, all at the same time, INSULATE to keep the plates from contact with one another—be POROUS to permit free circulation of battery solution, and be DURABLE to avoid need for reinsulation—started with rubber. Rubber had two of the necessary qualities—it insulates and it resists wear—Willard found the way to make it porous. Willard Threaded Rubber Insulation, made porous by thousands of tiny threads, is found only in the Willard Threaded Rubber Battery—the battery selected by the builders of 184 cars and trucks.

You can buy the Willard Threaded Rubber Battery of any of the dealers in your territory listed below. They all give authorized Willard Service:

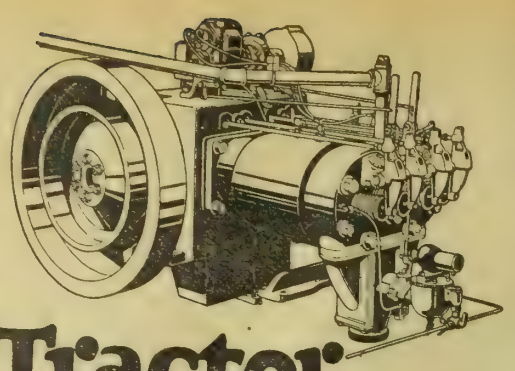
Willard Storage Battery Company of Canada, Limited, Toronto, Ontario

Willard THREADED RUBBER BATTERY

The Motor is the Heart of the Tractor



REMEMBER, it's the motor in the tractor that furnishes the power. Upon the motor's design and construction depend largely the service and satisfaction the tractor gives. The motor in the Waterloo Boy is a real farm tractor motor —the type for heavy, continuous duty. It is extremely simple —only two cylinders—only half the parts ordinarily required.

WATERLOO BOY KEROSENE TRACTOR

The motor has a long stroke and large bore, and develops its full rated horsepower at the low speed of only 750 R. P. M.

It is specially designed for kerosene-burning. Its consumption of fuel and oil is exceptionally low. Its economy has been proved in many competitive tests.

Its positive gear-driven governor insures an even and responsive flow of power to meet the variations in power required at the drawbar and at the belt.

The motor is accessible from a standing position. By merely taking off the crank case cover, the crank is exposed—it is easy to keep in good running order.

A combination force sight feed and spray oiling system insures proper lubrication of all engine parts under all conditions. The transmission of the motor's power to the wheels is accomplished with little loss of power. The Waterloo Boy furnishes 12 H. P. at the drawbar and 25 H. P. at the belt, with a reserve power always available to meet emergencies.

Thousands of users are operating the Waterloo Boy with economy and satisfaction. It's a tractor that will make a profitable investment for you.

See the Waterloo Boy at your John Deere dealer's and get our big free booklet that tells all about it. Write to John Deere, Moline, Ill., and ask for Booklet T 86.

treating a few plants or trees, and power machines are on the market for orchard work.

29. Tobacco Dust

The tobacco dust may be discharged over tree or plant, but as a rule it is diluted with 50 per cent of either kaolin or hydrated lime. Tobacco dust is largely discontinued because of variation in strength, depending on freshness.

30. Nicotine Sulphate Dust or Nicotine Dust.

Nicotine dust is a compound largely of kaolin, hydrated lime or sulphur or, more often, a combination. The mixture was first developed by Prof. Smith for use on walnut aphis. It is now used largely for all aphis and even other forms of insects. In buying and applying this mixture the user should keep in mind that there is a material difference between nicotine and nicotine sulphate. Nicotine sulphate as ordinarily sold contains 40 per cent pure nicotine. As high as a 10 per cent content of the sulphate has been recommended in some cases, but this necessitates a cost which is prohibitive excepting with high priced products. A dusting with such mixture would cost approximately $10 per acre for truck crops. Hence the following formulas, which are more often used:

(a) 2 per cent nicotine sulphate equals 0.8 per cent nicotine.
(b) 4 per cent nicotine sulphate equals 1.6 per cent nicotine.
(c) 5 per cent nicotine sulphate equals 2 per cent nicotine.
(d) 6 per cent nicotine sulphate equals 2.4 per cent actual nicotine.

Nicotine seems to give better results on some crops when applied with sulphur. Sulphur, however, should never be applied to cucumbers and melons because it would cause burning. For other crops sulphur may be used up to 60 or 70 per cent of the total.

31. Nicotine-Arsenate

Kaolin (about)	67 parts
Hydrated lime (about)	16 or 17 parts
Nicotine sulphate (40 per cent)	1 or 2 parts
Dry arsenate of lead	15 parts

FUMIGATION

32. Hydrocyanic Acid Gas

Liquid gas manufactured at a plant and delivered in the field for use is still the favorite for scale control on citrus, but here and there growers are trying the generating machine of a few years ago and others are using the cyanide and the pots of old times. From certain districts come reports that better results than for several years past have been secured with the liquid, while others are demanding a change from present methods. At least four different machines for applying the liquid gas are in the field this year besides the pots and generating machines, so the grower has some six different methods to choose from.

It is certain that orchard inspections next summer will show some interesting comparisons between different methods and it is to be hoped that it will be possible to find uniformity through one method or another.

For those who understand handling this deadly gas we give formula which may be used in manufacturing gas either for orchard trees under tent or for fumigating rooms, this dosage for every 100 feet of space. For warehouse stronger dosage may be used if preferred.

Sodium cyanide	1 ounce
Sulphuric acid	1½ fluid ounces
Water	2 fluid ounces

The acid and water are mixed in the vessel and the cyanide dropped in at the last moment.

33. Carbon Bisulphide

Carbon bisulphide is a liquid which evaporates quickly when exposed to the air, forming a heavy and inflammable vapor of great penetrating power. In using the material for fumigation it is essential that it be placed at the top of the room in a shallow container in order that the heavy vapors as they are driven off will thoroughly diffuse with the air container in the space to be fumigated. The proper amount to use depends upon the type of room being fumigated and ranges up to about 5 pounds to 1000 cubic feet in ordinary rooms where the walls and floor have not been made especially tight, even 10 pounds per 1000 for larger room or other than small, tight bin. Where possible 48 hours' exposure to gas should be secured. The best results are obtained by doing this work when the temperature is above 75 degrees Fahrenheit.

MISCELLANEOUS

Sulphur Fumigation. (See article by W. B. Hems on page 326.)

Growers have been longing for, and chemists have been endeavoring to provide, a royal road to weed eradication through the use of chemicals. However, the satisfactory chemical weed killer that is brought within reasonable cost is yet to be proven out. Several proprietary offerings have been made to growers and arsenic-caustic soda, sulphate of iron and others are still being experimented with. The use of sulphate of iron for controlling mustard and some other weed pests of the grain field is fairly satisfactory.

34. Sulphate of Iron for Weeds

Many weeds are susceptible to a spray of sulphate of iron and some, especially mustard, are so sensitive to it that spraying a grain field will often eradicate the mustard and still leave the grain growing lustily. A very strong solution is used:

Sulphate of iron	100 pounds
Water	50 gallons

Dissolve by constant agitation.

35. Arsenic-Caustic Soda for Weeds

Caustic soda (sodium hydroxide), or a good grade of concentrated lye, is much more active in dissolving arsenic than either sal soda or soda-ash, and much less is required, although the cost per pound is greater. Very little heat is required in the preparation of sodium arsenite by means of these materials. If made in large quantities (five gallons or more) the use of heat is unnecessary.

Granulated Caustic Soda (98 per cent)	10 pounds
White Arsenic (arsenic trioxide, 99 per cent)	20 pounds
Water, to make	5 gallons

Dissolve the caustic soda in about 2 gallons of water in a metal or wooden vessel (preferably iron), and while still hot add the dry arsenic, about a pound at a time at a sufficient rate so that the solution is just at the point of boiling, but does not actually boil. Stir continuously during the addition of the arsenic and until all is dissolved. Considerable heat is produced by dissolving the caustic soda. Additional heat is furnished by the chemical reaction involved in the union of the caustic soda with the arsenic to form sodium arsenite. After all the arsenic is dissolved let the solution cool and add water to make exactly five gallons.

(Caution.—Do not add cold water to the hot solution. An explosion may result as the solution is hotter than the boiling point of water.)

36. Torch for Dodder

Dodder, a most perplexing pest of alfalfa and other crops, may be controlled by the use of a gasoline torch burner. The kind with a chamber for compressed air and of large capacity is necessary. After cutting alfalfa, use the torch over infested spots in the field or burn the patches out thoroughly with dry hay or rubbish.

37. Tree Whitewash

In order to prevent sunscald whitewashing the trees or protecting by shade is at times necessary. Where a tree has been severely cut back or where a protecting limb has been broken off apply to the exposed limbs and trunk the following, known as California tree whitewash:

(a)	Quicklime	30 pounds
	Tallow	4 pounds
	Salt	5 pounds
	Water enough to make the mixture flow freely.	
(b)	Waterproof Whitewash	
	1. Quicklime	62 pounds
	Water (hot)	12 gallons
	2. Common salt	2 pounds
	Sulphate of zinc	1 pound
	Water (boiling)	2 gallons
	3. Skimmed milk	2 gallons

(1) Slake the lime thoroughly; (2), dissolve the salt and sulphate of zinc in the two gallons of water; pour (2) into (1) and add (3). Mix thoroughly Two pounds of flour paste (dissolved

in two gallons of hot water) may be added instead of the skimmed milk.

38. Lasting Whitewash

The formula 37 is perhaps the best tree whitewash, but where one wants one quickly made which is fairly durable, it may be made simply of quick lime, water and salt.

Quick lime	5 pounds
Salt	½ pound
Sulphur	¼ pound

Slake the lime slowly with water and add the salt and sulphur while it is boiling. Add enough more water to make a good wash.

39. Tree Barriers

Tree barriers, such as "Tanglefoot" or other sticky mixtures, are not as generally used as formerly owing to occasional injury to tree trunk on which they were smeared. Cotton or burlap bands are still used.

Cotton Bands. A four inch strip tied around the tree by a string at the lower edge, and the top then pulled down over the string is in use against Fuller's rose beetle on the orange, and other beetles and worms.

40. Asphaltum

Melt asphaltum (grade C or D) and paint while heated in four inch strip around crown of tree, clearing away soil six or eight inches. The ground should be cleared and afterwards filled back against the asphaltum.

41. Potato Bait

Wireworms which have become a serious pest in bean fields and with many of the garden or truck crops may be controlled to an extent by placing potatoes in the ground as a bait before planting the beans. The work should be started a week or so before the beans are put in and the potatoes should be pulled out by an attached wire every two or three days until the wireworms have been reduced to a minimum. After a few days these are lifted and the wireworms which have been attracted to the potatoes may be shaken into oil or other liquid and destroyed. The potatoes are located by cloth which is attached to a wire showing above surface of the ground. It is claimed the cost of this treatment is not over $5 or $6 per acre. This is only recommended in case of severe infestation in preceding years. It has been successfully practiced on a large scale in Ventura County.

42. Poisoned Barley

Following is the latest government formula for preparing poisoned barley for California ground squirrels:

Barley (clean grain)	16 quarts
Strychnine (powdered alkaloid)	1 ounce
Bicarbonate of soda (baking soda)	1 ounce
Thin starch paste	¾ pint
Heavy corn syrup	¼ pint
Glycerin	1 tablespoon
Saccharin	1-10 ounce

Mix thoroughly 1 ounce of powdered strychnine and 1 ounce of common baking soda. Sift this into ¾ pint of thin, hot starch paste and stir to a smooth, creamy mass. (The starch paste is made by dissolving 1 heaping tablespoon of dry gloss starch in a little cold water which is then added to ¾ pint of boiling water; boil and stir constantly until a clear thin paste is formed.) Add ¼ pint of heavy corn syrup and 1 tablespoon of glycerin and stir thoroughly. Add 1-10 ounce of saccharin and stir thoroughly. Pour this mixture over 16 quarts of clean barley and mix well so that each grain is coated.

(Caution: All containers of poison and all utensils used in the preparation of poisons should be kept plainly labeled and out of reach of children, irresponsible persons and livestock.)

* * *

THE HOST PLANT AND THE PEST

Following are helps in knowing the pests.

APPLES, PEARS AND QUINCES

Insect Pests

Aphis, Green (Aphis mali). Apply commercial lime-sulphur 1-10 or formula 10 just before buds open if orchard has been badly infested in past years. Also experiments on a small scale indicate that this species is easily controlled by nicotine dust, preferably when containing at least 1.6 per cent nicotine with 60 per cent or 70 per cent sulphur in the carrier.

Aphis, Leaf-Curling (Aphis sorbi). 9 or 10 plus nicotine sulphate, one pound to 100 gallons. Apply when the buds are beginning to open, pink showing in a few blossoms; spray very thoroughly.

Aphis, Woolly (Schizoneura lanigera). Spray with 15 whenever this pest appears above ground. Use at least 150 pounds pressure. For underground forms proceed as follows: Remove soil until upper roots are exposed at the base of the tree. Pour several gallons of 15 or solution of nicotine sulphate around crown and replace soil when it has soaked in. Repeat often. This insect has also been found to be susceptible to a nicotine-sulphur dust containing at least 1.6 per cent nicotine and 70 per cent sublimed sulphur in the carrier. Particularly recommended for the control of woolly aphis above ground in home orchards or in young orchards where the trees are not over 10 or 12 feet in height.

Pear Thrips (Euthrips pyri). Apply 5 per cent nicotine dust which should be guaranteed to contain not less than 1.6 per cent pure nicotine, preferably with carrier containing from 60 per cent to 75 per cent sulphur. Begin dusting as the thrips become numerous on the trees. Inspection should be made frequently after the buds begin to swell. Use about ¼ pound of nicotine dust on average sized tree.

Bud Moth (Lithophane antennata). Use 9 or 10 in winter and 17 before leaf buds open and after blossoms fall. Repeat every ten days if necessary.

Brown Apricot Scale. (See Apricots.)

Canker Worms, Fall Canker Worm (Anesopteryx pometaria Harris) Spring Canker Worm (Paleacrita vernata Peck). Apply 19 when worms first appear. Spray as often as needed. Bands on trees are very effective in keeping the caterpillars from the trees.

Codling Moth (Cydia pomonella L.). Apply 18 or 19. Continue to spray at intervals of ten days or two weeks throughout the season (at least four times). Arsenate of lead in dust form may be used under proper weather conditions. Except where strong winds are too constant to make the use of dust practical, dust applications may be used as effectively as a wet spray. Dusting for the control of the codlin moth is especially advisable in small home orchards where power sprayers are not available. Hand operated dusting machines with bellows of large capacity are especially suitable for this class of work.

Flat-Headed Borer. Apply 37 to prevent sunburn. Dig out borers. Prevent injury or dead spots on bark as the borer usually enters through dead areas.

Oyster Shell Scale (Lepidosaphes pomorum) and Greedy Scale (Aspidiotus camelliae). Apply 9 or 10 when trees are dormant.

Pear Slug (Caliroa cerasi). Dust on Paris green or pyrethrum or with lime and dry arsenate.

San Jose Scale (Aspidiotus perniciosus). Apply 9 or 10 when trees are dormant. If 9 is used follow instruction of manufacturer, or approximately 1 to 9.

Tussock Moth. Spray in full bloom with 20, 6 pounds to 200 gallons, and follow in ten days with neutral lead arsenate, 15 pounds to 200 gallons. Run over egg masses during winter. Apply cotton bands to tree trunk.

Fungoid or Bacterial Diseases

Apple Mildew. Cut off infested tips both winter and summer, also prune back all twigs somewhat as apricots are pruned. Spray with arsenites and Bordeaux combined or with lime-sulphur.

Bitter Rot (Glomeralla ruformaculans). Apply 1 or 2 (b) at first appearance of rot. Repeat every two weeks if needed.

Black Spot Canker (Myxosporium curvisporum Sacc.). Apply 2 (a) the first and fifteenth of November.

Moss or Lichens. Apply 1 (a), 2 (b), 9 or 10 when trees are dormant.

Pear Blight. No spray effective. The only treatment consists in cutting off blight as fast as it appears. Cut below affected parts so that good live wood is secured. Sterilize implements after eaoh cut by dipping them in 7. Recently planted orchards have taken advantage of resistant stocks.

Peach Growers

Prepare Now for Fall and Winter Spraying

Niagara Soluble Sulphur

is the best of all sulphur sprays for PEACH BLIGHT, LEAF CURL, and for scales, moss, and as a general clean-up.

COMPARE our DIRECTIONS for use, and PRICE with any other spray compound.

SOLUBLE SULPHUR has been used in many peach orchards in California for the past six years, and has been found effective when used.

14 POUNDS to 100 GALLONS water in fall spraying for PEACH BLIGHT.

12 POUNDS to 100 GALLONS water in spring spraying for LEAF CURL.

Saves your crop and cuts the cost of spraying.

Orange and Lemon Growers

Spray with **SOLUBLE SULPHUR** for Red Spider control. We have a new and important combination of SOLUBLE SULPHUR and **finely divided free sulphur** put up in **dry form,** and readily available for liquid spraying, — a contact spray and free sulphur in one. **TRY IT.**

NIAGARA DUSTING MACHINES, DUSTING MATERIALS, — DUSTING SULPHUR, NICO-SULPHUR, and NICODUST are efficient and reliable.

They Are Made Right by People Who Know How

Note Our Change in Office Address

F. A. FRAZIER

Western Representative

283-285 Minna Street, San Francisco

Powdery Mildew (Podosphaera oxycanthae). Apply 1 to 2 (a) when trees are dormant, then 2 (b) during spring and early summer. Remove mildewed tips in winter. Apply 9 or 10 just before buds open.

Sappy Bark. Cut away diseased parts when trees are dormant.

Scab (Venturia inaequalis, Winter). Apply 1 or 2 (b) before buds start. Spray again with 2 (b) as soon as blossoms fall. Repeat several times at intervals of three or four weeks. (This should be done especially if the weather is damp.)

It is a good plan to give through winter or dormant season spraying with 9 or 10 or crude oil emulsion in order to clean up insects, mosses and other fungus pests.

CITRUS FRUITS

Insect Pests

Army Worms (Various species). Apply 21 or 22 under trees; also if they have not already secured access to orchard, surround trees with deep furrow, vertical side toward trees. If cover crops are growing, remove such growths as project up into branches of the trees. Paint tanglefoot bands around tree trunk. (See 39.)

Black Scale (Saissetia oleae). Fumigate with 32 during period between September 1 and January 1. Spray young trees with 12 or 14 during the months of September, October and November.

Coccus citricola. This has become a serious pest in past few years. Treatment given is generally fumigation. (Formula 32.)

Fuller's Rose Beetle (Pantomorus fulleri). This insect cannot fly and can be kept from the tree by means of tanglefoot bands.

Hemispherical Scale. (See Black Scale.)

Long Scale (Lepidosaphes gloverii). Fumigate as soon as found with 32.

Mealy Bugs: Long Tailed Mealy Bug (Pseudococcus longispinus); Citrus Mealy Bug (Pseudococcus citri). This pest is being successfully handled by the introduced insect Cryptolaemus Montrouzieri, colonies of which may be had by applying to G. H. Hecke, Director, State Department of Agriculture, Sacramento.

Orange Aphis (Aphis gossypii glover). Spray with 14 or 15 as soon as found. Citrus aphis and citrus thrips, together with many other forms of aphis, may be combated by nicotine dust known to contain not less than 1.6 per cent nicotine, with carrier containing 60 or 75 per cent sublimed sulphur.

Purple Scale (Lepidosaphes beckii). Fumigate.

Red Scale (Chrysomphalus aurantii). Same as Purple Scale.

Red Spider (Tetranychus mytilaspidis). Apply finely ground or flowers of sulphur (see 6) if by hand or knapsack type of machine, pure sulphur without diluent such as hydrated lime or kaolin; if by powder machine, ¼ lime may be used. Some prefer spraying with commercial lime-sulphur. Dry sulphur is effective only when a warm summer temperature prevails. The requirement for proper fuming of the sulphur is generally stated to be a temperature above 75 degrees.

Fungoid and Bacterial Diseases

Brown Rot (Pythiacystis citrophthora). Sow cover crop in orchard. Plow under in spring and cultivate well under the trees. In fruit washer use 5, bluestone, or permanganate of potash. Eliminate infected fruit and disinfect boxes and picking sacks.

Gum disease, formerly considered a physiological trouble, now best treated by raking away dirt from trunk of tree, scraping off all diseased bark or tissue and painting with 3.

Mottle Leaf (Physical). Improve physical condition of tree by deep culture. Make applications of lime and manure to soil. Examine soil as to hardpan, and if it exists, break up.

Smut (Meliola camelliae, Sacc.). A fungous growth caused by honey dew exuded by scale insects, plant lice and white fly. Remove pest and smut will disappear.

Wither Tip (Colletotrichum gloeosporioides, Penz.). Apply 1 or 2 (b) as soon as it appears and repeat as often as necessary.

DATES

Marlatt Scale. (Phoenicococcus marlatti). Dip young plants or spray old ones with a solution of phenol.

Parlatoria Scale (Parlatoria blanchardi). Most effective treatment burning with gasoline torch.

OLIVE

Insect Pests

Black Scale. Best treatment, fumigation with 32 October-January. If sprayed use 12, 13 or 14. When young insects appear in large numbers on leaves and stems apply spray. Two or three sprayings may be necessary.

Twig Borer (Polycaon confertus). Cut off twigs and burn.

Fungoid and Bacterial Diseases

Keep trees free from other pests, well pruned out so as to admit light and air.

Olive Knot. A bacterial disease in the form of a woody tumor. Attacks most vigorous trees. Distributed principally by pruning tools. After pruning dip tools in 7. Cut off all tumors, removing the entire twig, and burn.

Peacock Leaf Spot (Cycloconium oleaginum). Fungus on leaves and fruit. Spray with 1 or 2 (a).

PEACH, NECTARINE AND APRICOT

Insect Pests.

Aphis, Black Peach (Aphis persicaeniger). For those above ground use 29. Destroy the underground forms by pouring carbon bisulphide into holes in the ground (made by a crowbar) six inches to six feet away from the tree and about two feet apart. Pour 15 around base of tree often.

Apricot Scale (Eulecanium armeniacum). Apply 13, 14 or 15 just as soon as the leaves fall. All applications should be made before the first of December.

Black Scale (Saissetia oleae). Same treatment as Apricot Scale.

Borer, Peach Tree (Sanninoidae pacifica Riley). Dig out and kill, or destroy by inserting a flexible wire into their burrows and applying 37, 38 or 40.

Bud Moth (Lithophane antennata). Use 9 or 10 during winter months when tree is dormant. Use 19 just before leafbuds open and just after blossoms fall. Repeat every ten days if necessary.

San Jose Scale (Aspidiotus perniciosus). Spray with 9 or 10 when trees are dormant.

Twig Borer (Anarisa lineatella). Spray with 9 or 10 when buds are swelling.

Fungoid and Bacterial Diseases

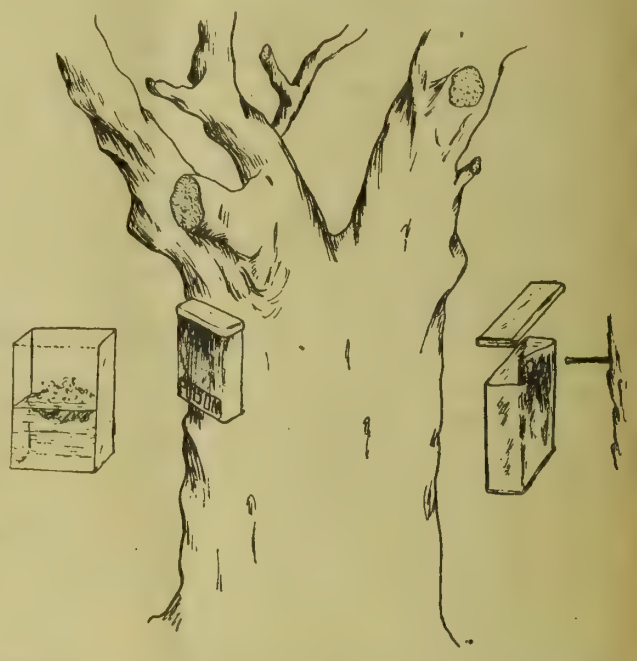
Blight, Peach (Coryneum beyerinkii). Spray last of November or before December 15 with 1 or 2 (a) or 9 or 10.

Brown Rot, Blossom Blight, Gumming Twig Blight, Green Rot, Shot Hole. Destroy mummies in fall. Spray with 9 or 10 as buds are swelling and again when first blossoms are open. If rainy while "jackets" are on, spray with lime-sulphur 1-30. For the control of brown rot of the fruit, summer spraying with sulphur paste or the so-called self boiled lime-sulphur is often recommended. In California such practice has resulted quite frequently in injury to the trees and must therefore be tried with caution. The injury consists in a yellowing of the foliage, stunting of the fruit, disfigurement by sediment on the fruit, and failure of the trees to bloom the following season.

Curl Leaf (Exoascus deformans, Fuckel). Spray thoroughly with 1 or 2 (a) in spring before blossoming. Later spraying should be made with 2 (b).

Shot-hole Fungus (Coryneum sp.). Spray with 1 or 2 (a) about ten days before buds open and with 2 (b) when fruit is about one-fourth grown.

Diseases, such as little leaf, exanthema, dieback, mottled leaf, rosette, bitter pit, dry rot, blossom-end rot in which the cause is not known and which seem unlike the usual effects of unfavorable conditions or parasites. Most of these troubles show a relation to soil conditions and occur especially in dry, sandy, gravelly, or hard pan soils, those very deficient in humus, or under conditions of irregular soil moisture. Trees standing over old barnyards or corrals or where excessive amounts of manure have been applied are also likely to show some of these conditions. The best possibilities of treatment lie along the line of increasing the humus content of the soil by means of green manure crops



ANTS!

Ants are an awful household pest. The Argentine ant is becoming a serious tree pest. Kill em!

Mix formula 23 as given on Page 314 or the formula as given by Mr. Herms on Page 327. Place about the house or where convenient on trunks of trees as indicated in this illustration.

Owners Who Spray Have Orchards That Pay

There's no doubt about it—now. Citricola and black scale in Southern California can be overcome—and red spiders routed —with Balfour, Guthrie & Company's patented formulas for spraying. Your trees—like those our experts sprayed on 20,000 acres in Tulare County—can produce fancy packs and bigger profits.

It is not too late to succeed with this year's crop. But you must start spraying **now.** You don't have to experiment. You can take advantage of the field tests that already have proved the superior merits of scale formulas for this time of year:

B. T. S.	15 lbs.		Lime Sulphur	4 to 5 gallons
Triumph	2½ gallons	or	Triumph	2½ gallons
Glue	1 lb.		Glue	1 lb.

Scale infested trees. as you know, set much less fruit. By spraying NOW with our tested materials, you save your foliage and fruit from the honeydew and that black, sooty fungus later.

Write or call at our headquarters in the H. W. Hellman Building, Los Angeles. Frank B. Herbert, assistant entomologist and his aides will examine your grove free of charge. They will tell you the right spray to use and how to use it. To get best results, spray today.

A new bulletin on citrus spraying by our expert entomologist, Paul R. Jones, is yours for the asking.

UNIVERSAL BRAND ORCHARD SPRAY

La Habra Heights

Higher and Adjoining East Whittier and La Habra Districts

3,600 acres pronounced by experts the ideal location for avocado and citrus planting. Protected from frost and wind in combination with good soil. Nearly $250,000 spent on irrigation plant, roads and other improvements. The Hacienda Country Club, with 151 acres of golf course and other recreations, is located in the center of this property.

Ideal conditions for avocado and citrus growing. Fine country club for recreation; beautiful homesites.

Any acreage desired. Low prices. Reasonable terms.

We also specialize in choice Southern California walnut, orange, and lemon groves.

Edwin G. Hart

Developer and Exclusive Agent for North Whittier Heights

727-731 Van Nuys Building . . . . Main 2606 . . . . Los Angeles

and mulches, breaking up all hard pan and plow soles, more careful irrigation to insure the maintenance of a proper and uniform moisture condition of the soil down to a depth of several feet, and throughout the season until rains occur, and planting of alfalfa in orchards where plenty of water is available. The soil in areas where these troubles occur should be examined for alkali or other injurious substances. Where any of these diseases are serious and persistent it may be better to grow some other crop than to keep on with one which is seriously affected.

Bud Blight. Spray with commercial lime-sulphur 1.8 or formula 10.

CHERRIES, PRUNES, PLUMS

Insect Pests

Cherry Slug (Caliroa cerasi). Spray with 19, or, perhaps better, give treatment recommended for pear slug.

Prune Aphis (Aphis prunifolii). Spray in the fall with 9 or 10 and as soon as the lice appear with 29.

Thrips. (See Pear Thrips.)

Black Peach Aphis (Aphis persicae niger Sm.). See Peach Aphis.

Borer (Aegeria opalescens). See Peach.

Canker Worm (Paleacrita vernata and Alsophila pometaria). See Apple.

Tent Caterpillar (Malacosoma disstria). See Apple.

Brown Day Moth (Pseudohazis eglanterina). Attacks particularly the prunes and cherries. Spray with 19 or 20 or apply 21 under tree.

Red Hump (Schizura concinna). Spray early with 19. Burn cocoons. Also dust with 27.

Fungoid and Bacterial Diseases

Brown Rot or Fruit Mold (Sclerotinia fructigena Sch.). Produces a rot on the fruit. Spray with 1 or 2 (a) early in the spring, and with 2 (b) as soon as the buds begin to open.

Leaf Curl or Witches Broom (Exoascus cerasi Fuckel). Cut out and burn infested parts. Spray with 1 or 2 (a) early, and with 2 (b) as soon as the buds begin to swell.

Leaf Spot or Shot Hole Disease (Cylindrosporium padi Karst). Produces a shothole effect upon the leaves. Spray in early spring with 1 or 2 (a), when the buds begin to open with 2 (b), and when the fruit is one-fourth grown with 2 (b).

Powdery Mildew (Podosphaera oxycanthae DC.). Appears on the leaves late in the season. Spray as soon as found with 26 and repeat if necessary.

Crown Gall (Pseudomonas tumefaciens Erw. Smith and Town). If on young trees recently set from nursery, remove and burn. If on bearing trees, chisel away until only the healthy wood remains. Paint with 3. Watch for a reappearance and treat as before.

Gummosis. Dig out the gum pockets and wash out with 1, 2 (a) or 3.

NUTS

Insect Pests

Aphis. Walnut aphis has developed as a major pest within the past few years. Dust with nicotine sulphate diluted with kaolin or hydrated lime. Nicotine dusts are on the market, which are proving very successful in combating this pest. Or apply 30.

Red Spider of Almonds. Apply 9 or 10 summer mixture, or, perhaps better, 6.

Codling Moth of Walnut. Apply 31.

Fungoid and Bacterial Diseases

Crown Gall. If young trees, dig up; if older, chisel to healthy wood and paint with 2.

Dieback. Physical disturbance. Correct soil conditions.

Blight. Sprays ineffective. Plant resistants.

GRAPE

Insect Pests

California Root Worm (Adoxus obscurus L.). A black beetle whose larvae attack the leaves, stems, petioles, roots and fruit of the vines. Cultivate deeply around the base of the vines. Spray with 19 as soon as beetles appear.

Erinose (Eriophyes vitis). This so-called disease is produced by a small mite, which is characterized by forming swellings upon the upper surfaces of the leaves. Dust plants lightly with 6 when they are wet with dew.

Flea Beetle (Haltica carinata Germ.). It infests the foliage and may be handled by spraying liberally with 19.

Grape Leaf Folder (Desmia funeralis Hub.). The larvae roll themselves up in the leaves which they eat. Spray with 19.

Grape Phylloxera (Phylloxera vastatrix). Attacks roots and foliage of the vines. Plant resistant stock. Be sure of your nursery stock. When possible long continued flooding of fields is beneficial.

Grasshoppers. (See Beans.)

Hawk Moth (Philampeles achemon Drury). The large green larvae of this moth feed upon the foliage. Hand pick, or if too numerous spray with 19.

Nematode Root Gall (Heterodera radicicola Mull.). A minute worm attacking the small roots. Destroy all infested vines. Sterilize soil with heat or 33. Plant only hardy varieties where this exists.

Vine Hopper (Typhlocyba comes Say). Infests foliage of the vines. Use hopperdozer in spring before adult females deposit their eggs. Spray as soon as the young begin to appear with 13, 14 or 15.

Fungoid and Bacterial Diseases

Powdery Mildew (Uncinula spiralis and Uncinula necator Schw.). Grows upon the canes, leaves and fruit. Dust often with 6 as soon as the disease appears. Spray early with 1 or 2 (a).

Downy Mildew (Peronospora viticola DB.). Attacks all green portions of the plant—leaves, young shoots, and berries. Spray with 1 or 2 (b) as soon as first appearance.

BLACKBERRIES, RASPBERRIES, LOGANBERRIES, STRAWBERRIES

Insect Pests

Rose Scale (Aulacaspis rosae Bouche). A white scale thickly infesting the canes just above the surface of the ground. Spray with 13, 14 or 15.

Strawberry Plant Louse (Myzusfragaefolii Ckll.). A light yellow louse attacking the buds, blossoms and young fruit. Spray with 13 or with 15.

Fungoid and Bacterial Diseases

Orange Rust (Gymnoconia peckiana Tranz.). Forms orange-red colored masses on the leaves, which finally kill the plant. Dig out and burn all diseased plants as soon as rust first appears.

Leaf Spot on Blackberry and Raspberry (Septoria rubi West.). Produces small pale spots on the leaves. Spray with 1 or 2 (b) when leaves are half grown and repeat every two weeks if necessary.

Leaf Spot of Strawberry (Mycosphaerella fragariae Lind.). This disease first appears as small discolored spots upon the leaves which destroy the tissues of the plant. Spray before the flowers open with 1 or 2 (b). If the disease appears late, mow off and burn the leaves. Spray the newly appearing leaves with 1 or 2 (b).

Powdery Mildew of the Strawberry (Sphaerotheca humuli). Produces a whitish powdery covering on the foliage which soon kills the plant. Dust with 6.

Crown Gall (Pseudomonas tumefaciens Erw.). Affects, especially, the blackberry. Dig vines as soon as this trouble appears; there is no cure. Secure new, clean stock and plant on fresh ground.

CURRANTS AND GOOSEBERRIES

Insect Pests

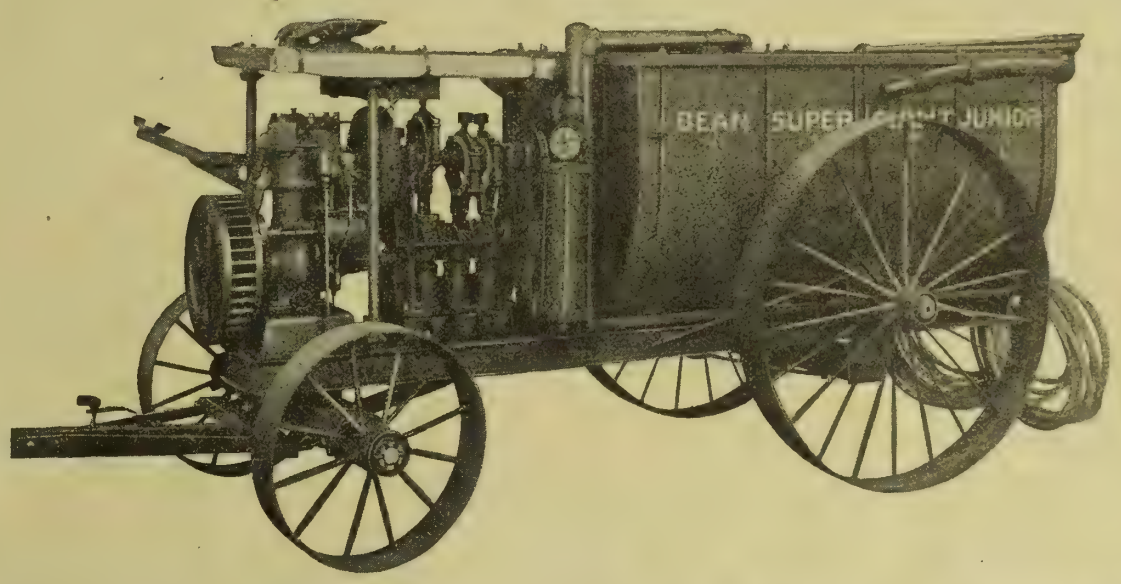
San Jose Scale (Aspidiotus perniciosus Comst.). A small scale infesting the stalks. Spray when dormant with 9 or 10.

Currant Stem Borers (Sesia tipuliformis and Chrysobothris femorata). Small white larvae which bore into the stalks of the plants. As a preventive, wash plants in the spring with strong soap solution.

Imported Currant Worm (Nematus ventricosus Klug.). Attacks the leaves in the spring. Dust plants with white hellebore when they are wet, or spray with 15.

Leaf Hopper (Empoasca albopecta Walsh). Usually appears in great numbers on the undersides of the leaves. Spray with 13 as soon as the first ones are noticed.

Currant Leaf Louse (Aphis ribis). Usually works upon the ends of the tender shoots and stunts their growth. Spray with 13 or 15.



Better Spraying and More Profit With This New BEAN Power Sprayer

This new outfit throws 14 gallons of liquid a minute at 300 pounds pressure. That means speed. And it does the work thoroughly as it goes. Most spray applications must go onto the trees at just the right time for greatest effectiveness. If your outfit is too small, the work is too slow, and a lot of the spraying is only half effective, if not entirely useless. You get the spray onto the trees when it does the most good—if you put it on with a

BEAN Super-Giant Junior

Besides, you make every hour of good spraying weather count! This new outfit not only has big nozzle capacity but big tank capacity (300 gallons). Big nozzle capacity and big tank capacity means quicker work and better work—your spraying costs you less money and your fruit brings you more money. The Bean Super-Giant Junior is equipped with the new Bean 6 h. p. engine, a wonderful improvement. It has the power! Send the coupon—for our new catalog—which tells you about this new outfit in detail and describes the entire Bean line.

Fungoid Pests

Leaf Spot (Septoria ribis Desm.). Produces large pale spots with brown borders upon the leaves. Spray with 1 or 2 (b) as soon as first spots appear and repeat as often as is necessary to keep down the disease. Spray with 2 (b) twice after fruit has been removed.

Anthracnose of Currant (Pseudopeziza ribis Kleb.). Produces small brown spots upon the leaves, petioles, young canes, fruit stalks and fruits. Spray with 1 or 2 (a) before leaves appear and with 2 (b) while leaves are unfolding and repeat every three weeks until fruit ripens.

Gooseberry Mildew (Sphaerotheca morsuae B. & C.). Produces a mildew upon the stems, leaves and particularly upon the berries, causing them to spoil. Spray with 2 (b) just as the buds are breaking open and repeat every 12 days until about July 1. Spray plants in winter with 9 or 10.

ALFALFA, PEAS, BEANS, VETCH, CLOVER

Insect Pests

Alfalfa Weevil. Not yet in California. About the only treatment is to disk early in spring. Cut as soon as eggs are laid, about first or middle of May; or the three essentials are: dust, heat and starve; drag the field with brush drag or spray with 20 (b).

Wireworms (Various species). Affect beans and many other garden plants. Rotation of crops to starve out the infestations is perhaps the best treatment. Where this cannot be done, the use of carbon bisulphide in sandy ground is advised. Fertilize with nitrate of soda or kainit. Also use 41.

Bean Aphis (Aphis rumicis L.). Works on the leaves, young shoots and tender pods, causing much damage. It is usually cared for by an internal parasite and by a predacious ladybird (Scymnus sordidus), but if it becomes too destructive spray with 13 or 15 or nicotine dust containing not less than 1.6 per cent nicotine, with carrier containing 60 to 75 per cent sulphur.

Green Pea Aphis (Macrosiphum pisi Kalt). Also attacks vetch, geraniums, malva, and many other plants. Spray with 16½. Dust with nicotine dust containing not less than 2.4 per cent nicotine with carrier containing 60 to 75 per cent sulphur.

Cut Worms (Peridroma saucia, Agrotis ypsilon.) Do great damage to all crops at certain seasons. Plow around field so as to have straight side of furrow next to the crop. Poison with 21 or 22.

Grasshoppers (Various species). Are very difficult to handle. Poisoned baits as given in 22 have given good results. Fall plowing of breeding grounds essential.

Bean Weevil (Mylabris obtectus Say). **Pea Weevil** (Mylabris pisorum L.). Fumigate seed with 33 and be sure that no infested seed is planted. Test by placing in water; infested seeds will float.

Fungoid and Bacterial Diseases

According to some investigators bean rust cannot be controlled by either wet or dry sprays. In circular 204, California experiment station, sulphur as dust is recommended. At the Virginia agricultural experiment station, the following varieties were found to be "rust free": Improved Goddard, Mexican Red, White Kidney and Wells Red Kidney. The following were reported as "rust proof," showing little if any rust injury: Yellow Eye, Dwarf Horticultural and French's Horticultural.

Bean Anthracnose (Colletotrichum lindemuthianum B. & C.). Produces brown sunken areas upon the pods. It also attacks the young plants. Treat seeds with 8 before planting. Spray with 1 or 2 (b) as soon as young seedlings are well under way. Repeat if necessary. Practice clean cultural methods.

Bean Blight (Bacillus phaseoli). Attacks pods and produces wrinkled and distorted seed. Treat seed with 8 before planting, or, better, pod selection is effective. Seed three or four years old still better.

Rust (Uromyces appendiculatus Lev.). Produces rust colored spots on foliage. Spray with 1 or 2 (b). Burn all infested plants.

Downy Mildew (Phytophthora phaseoli Thax.). Turns foliage dark and causes it to wilt and die. Select clean seed. Spray with 1 or 2 (b).

Downy Mildew of Alfalfa (Peronospora trifoliorum). Spray with 1 or 2 (b) or dust with 6.

Pea Mildew (Erysiphe polygoni DC). Appears early and late, covering plant with a white felt-like powder. Spray with 1 or 2 (b) or dust with 6.

Dodder. Dodder usually comes because of infested seed at planting time. However, where irrigation waters are from gravity flow from mountain streams the seed may be introduced by them. Where patches appear in alfalfa burn by piling straw over infested spot or use gasoline blast torch. Keep close watch and destroy every portion of the vine as soon as it appears. Where appearing in grapevines or trees a measure of control may be had by spraying with 2 (a) in winter time and when trees are in leaf 2 (b).

ONIONS, LEEKS, GARLIC, ETC.

Insect Pests

Onion Thrips (Thrips tabaci Lind.). Attack the leaves and flowers, causing considerable damage in some localities. Spray with 16½ as an insecticide or use nicotine dust containing 1.6 per cent nicotine.

Cutworms. See Beans, Peas, etc.

Fungoid Diseases

Downy Mildew (Peronospora schleideniana DB). Produces a white mould on the leaves, causing them to wilt and die. Spray with 1 or 2 (b).

Onion Smut (Urocystis cepulae Frs.). First appears in the form of dark spots upon the leaves and later as longitudinal rifts upon the bulbs. The following drilled into the soil at the rate of 150 pounds per acre has given good results: lime, 50 pounds mixed with sulphur 100 pounds. Also treat seed with 7 or 8 as they are being drilled into the soil.

CABBAGE, CAULIFLOWER, KALE, TURNIP, RADISH, MUSTARD

Insect Pests

Harlequin Cabbage Bug (Murgantia histrionica Hahn). Attacks all cruciferous plants, cultivated and uncultivated, as well as many other hosts. Keep weeds from the field at all times; plant late trap crops of kale or cabbage and burn when they become infested, or kill the bugs with pure kerosene. Hand pick adult insects as soon as they first begin to appear. Spray with 13.

Cabbage Aphis (Aphis brassicae). Attacks a wide range of cruciferous plants, cultivated and uncultivated. In time, it is subdued by parasitic and predacious enemies, but often not until it has done great damage. It can be controlled by spraying with 13 or with 40 per cent nicotine sulphate, 1 pound to 100 gallons, or, perhaps better, with nicotine dust guaranteed to contain not less than 1.6 per cent nicotine preferably with a carrier containing 60 per cent to 75 per cent sulphur.

Cabbage Worms (larvae of Pontia brassicae, the Large White Butterfly, and of Pontia rapae, the Small White Butterfly). The latter is more common. Dust with arsenate of lead, using a 10 per cent mixture with lime or nicotine dust, the latter when the cabbage louse is to be controlled at the same time.

Diamond Back Moth (Plutella maculipennis Curtis). Tiny Moth. Treat as above.

Cutworms. (See Beans, Peas, etc.)

Fungoid and Bacterial Diseases

Club Root (Plasmodiophora brassicae Wor.). A disease producing a peculiar enlargement of the roots giving the plants an unhealthy appearance and finally causing their death. The disease may be carried over in the soil, so the following has been recommended as a means of control: lime the soil at a rate of 100 bushels per acre, every few years. Rotate crops. Employ clean culture methods.

Black Rot (Pseudomonas campestris Smith). A bacterial disease first producing a burnt margin on the leaves and finally causing them to drop. The disease is readily carried from year to year in the seed. Before planting treat the seed with 7 or 8. Eliminate infected plants as soon as they appear in the beds. Rotate crops.

TOMATO, POTATO, EGG-PLANT, TOBACCO, ETC.

Insect Pests

Tomato Fruit Worms (known also as

Byron Jackson Service

WHEN you buy a Byron Jackson deepwell turbine your purchase includes Byron Jackson service.

A service built on an engineering foundation that goes back to the very beginnings of irrigation in the west.

Starting in the factory testing department, this service accompanies the pump through the installation and down through the years of operation by means of a state-wide system of service cars.

Your water development problem is assured prompt and expert attention in our engineering department

Geo. C. Roeding, Pres.

Fancher Creek Nurseries

Fresno, Cal.

Nobody appreciates the perils of motoring so much as the pedestrian.

"corn ear worms" and "cotton bollworm." Frequently exceedingly destructive to tomatoes. Dust with arsenate of lead undiluted, or (33 1-3 to 50 per cent) with hydrated lime. If fruit nearly ripe use great care with poisons. Do not spray within two weeks of coloring. Begin applications when fruit begins to set and continue at 10 or 15-day intervals, using from one to two pounds of arsenate of lead per acre for each application, according to the size of the plants. Plant sweet corn at suitable periods to serve as trap plants. The moths prefer the fresh silks of corn to tomato plants when depositing their eggs. If corn is used as trap, destroy all worms before they reach maturity.

Tomato Worms. (Are the larvae of two Sphynx Moths, Plegethonitus quinquemaculata How. and Plegethontius sexta Joh.). These large green caterpillars feed upon the foliage and are easily recognized. Due to their large size, it is very effective to hand pick the infested area. If very numerous spray with 19, or dust with arsenate of lead, using 50-50 mixture with hydrated lime.

Flea Beetle (Epitrix parvula Fab.). A very small beetle which works on the leaflets. As a repellent spray with 2 (b); for an insecticide, 19.

Twelve Spotted Cucumber Beetle. (Diabrotica soror Lec.). A small green beetle with 12 black spots on the elytra. The larvae work on a great variety of plants. Spray with 19. Repellant same as flea beetle or use 30 (c).

Cutworms. (See Beans, Peas, etc.).

Fungoid and Bacterial Diseases.

Winter Blight or Downy Mildew (Phytophthora infestans DB). Attacks nearly all of the plants of this family, killing the leaves and injuring the tubers. Plant clean seed. Disinfect doubtful seed with 7 or 8. Spray plants with 1 or 2 (a) as soon as symptoms first appear.

Root and Stem Rot (Corticium vagum var. solani Burt.). Causes a "damping-off" of seedlings. Also attacks the tubers of potatoes, the subterranean parts of the tomatoes, and the fruits touching the soil. Apply lime to aerate the soil. Rotate crops.

Dry Rot of Potatoes (Fusarium oxysporium Schl.). **Wilt of Tomatoes** (Fusarium lycopersici Sacch.) and **Wilt of Egg Plant** (Fusarium sp.). All produce a wilt upon the host plants, affect the roots, and may even cause a "damping-off" of seedlings. Treat seed with 7 or 8 before planting. Keep weeds out of fields in winter. Rotate crops, so as to have clean soil each year.

Early Blight (Macrosporium solani E. & M.). A typical leaf blight causing brown spots to appear on the foliage. Affects potatoes, tomatoes and daturas. Spray with 1 or 2 (a) when the plants are six inches high and repeat with three applications two weeks apart. Treat seed with 7 or 8 before planting. Rotate crops.

Potato Scab (Oosporascabies Thax.). Produces large rough blotches on the tubers. This disease cannot be dealt with while the plants are growing. Great care must be exercised in the matter of seed selection. Treat all seed of doubtful origin with 7. Rotate crops so as to keep the soil fresh.

SQUASH, PUMPKINS, CUCUMBERS, MELONS, ETC.

Insect Pests

Melon Aphis (Aphis gossypii Glov.). Attacks all parts of the vines, particularly feeding on under side of leaves, and is usually accompanied by a black smut which grows upon the honey-dew secreted by the louse. Spray with 16½ or dust with 30 (c).

Cucumber Beetles, Striped (Diabrotica Vittata Fab.) Twelve-spotted (Diabrotica soror Lec.). The larvae and adults of these beetles destroy flowers and foliage of the plants and gnaw the rinds of the fruit. Methods of control are as follows:

Repellents—Dust with gypsum or lime containing arsenate of lead on 50-50 basis. Insecticides—Dust with 30 (c).

Squash Bug (Anasa tristes DG.). Hand pick early in the season; also pick off eggs and destroy. Eggs are deposited in clusters on the leaves when the vines are very young. Trap bugs by laying boards loosely on the ground under which they crawl for protection. If very troublesome use 16½ or 30 (d). As soon as crop is harvested, gather and burn vines. Do not allow weeds to grow on the ground during winter months.

Fungoid and Bacterial Diseases

Downy Mildew (Pseudoperonospora cubensis Rost.). Disease first appears in the center of the vine and spreads outwardly. Spray with 1 or 2 (b) to which is added one gallon of sulphurous acid to every 100 gallons of spraying material. Repeat every ten days.

Leaf Blight (Alternaria brassicae nigrescens Pegl.). Produces spots on the leaves which spread very rapidly. This disease hastens ripening, injures production, and destroys the quality of the fruit. It particularly affects cantaloupes. Destroy affected plants as soon as they first appear. Spray often with 1 or 2 (b). Rotate crops.

Anthracnose (Colletotrichum lagenarium E. & H.). Forms circular dead spots on the leaves and long shrunken areas on the stems. The fruits of the watermelon are often badly spotted by this disease. Spray with 1 or 2 (b) as soon as fungus appears.

Common Wilt (Bacillus tracheiphilus Erw. Sm.). Produces a sudden wilt of the vines by stopping up the water-carrying vessels of the stems. Destroy infected plants as soon as infection appears.

Fusarium Wilt (Necosmopora vasinfecta var. nivea). Can be handled only by crop rotation.

Powdery Mildew of the Cucumber (Erysiphe polygoni DC.). Attacks other members of this group also. Forms a white powdery coating on the leaves and stems and soon kills the plants. Spray as soon as it first appears with 1 or 2 (b).

Seed houses often have admirable suggestions for the gardener and are usually able to supply small hand equipment which greatly facilitates spraying and dusting.

CELERY, CARROTS, PARSNIPS

Insect Pests

Celery Leaf-tyer (Phlyctaenia ferrugalis Hbn.). Destroys foliage, and its presence may be told by the many leaves which are curled and fastened together by this insect. It is particularly bad in greenhouses. Spray when worms first appear with 19 not later than three weeks before marketing crops, because of the danger of poisoning. Hand pick.

Cutworms. (See Beans, Peas, etc.)

Fungoid Diseases

Celery Blight, Early Blight (Cercospora apii Fr.). Produces spots upon the leaves causing them to turn yellow, to wilt, and finally kills them. This disease also affects parsnips, and usually appears early in the season. Spray early and repeatedly with 1 or 2 (a).

Late Blight (Septoria petroselini var. apii B. & C.). Produces rusty brown spots upon the leafilets which may rapidly spread to cover the entire foliage. Spray with 1 or 2 (a) throughout the season.

ASPARAGUS

Insect Pests.

Asparagus Beetle (Crioceris asparagi L.). Dust air slaked lime upon the plants when they are wet with dew. Apply dry lead arsenate or 19.

Fungoid Diseases

Asparagus Rust (Puccinia asparagi DC.). Attacks the bushy tops, producing black and red rust, the latter being the destructive stage. Keep the plants cut back until July 1. Apply dry sulphur three weeks after cutting tops and before rust appears. Make the applications in the morning when the plants are wet with dew, or first spray with 1 or 2 (b).

BEETS

Insect Pests

Wireworms. Plow in fall to destroy pupae. Plant early and practice clean culture. Trap adults by means of piles of straw and burn in late fall or winter.

Growers Protect With Red Seal

Removing every chance for substitution as RED SEAL BRAND is sold only in its original trade-marked bag—direct from the fields to you.

CERTIFIED

Hairy Peruvian Alfalfa Seed

offers positive protection in your securing GENUINE HAIRY PERUVIAN ALFALFA SEED. You now have a brand that is the SIGN OF HONOR—RED SEAL BRAND—and we growers stand back of it.

Study the bag above—that's a sure way to secure certified Hairy Peruvian Alfalfa Seed. Look for the Blue Tag.

NEW OFFICE and FACTORY
2801 Santa Fe Ave.
Los Angeles, Cal.

Gentleman is a term that does not apply to any station, but to the mind and feeling in every station.—Talfourd.

Fungoid Diseases

Curly Top (Blight). Plant as early in season as soil can be properly prepared and good germination and growth obtained. This varies in different districts from December 1 to March 1, according to temperature and rainfall. Finish thinning before hot weather. Irrigate early, and often enough to prevent wilting during spring and summer. The disease need not be feared unless the insect Eutettix tenella is abundant.

Seedling Root Rot. Replant if stand is too thin.

CORN, SORGHUM

Insect Pests

Corn Worm (Chloridea obsoleta). Is hard to deal with because it works on the ear in the husk. It is best handled by the rotation of crops, late plowing followed by harrowing to destroy the pupae in the soil, and by planting crop as early as possible to assure rapid growth. Dust lightly with arsenate of lead two parts and sulphur or lime one part, three to five days after silk appears.

Wireworms. (See under Beans.)

Fungoid Diseases

Smut (Ustilago zeae Ung.). Causes enormous enlargements of the kernels, producing large sacs of smut. Cut off and burn the first infestation. Treat seed with 7 or 8 before planting. Rotate crops.

GRAIN

Rust. No remedy. Some varieties are more resistant than others.

Smut. Seed grain should be carefully cleaned of smut balls, weed seeds and small cracked and inferior grains before treating. The smut balls in wheat and smut masses in barley may be cleaned out in fanning mills or floated out in water and skimmed. Place the cleaned seed in half-filled sacks tied at the end. Immerse these sacks for three or four minutes in a bluestone solution, 4 (a). Drain the sacks until dripping no longer occurs, then dip them for three minutes in 4 (b). The lime prevents injury to the germ from the bluestone. If quicklime cannot be secured, air-slacked lime, 1 pound to 8 gallons of water, may be used. After thus treating, the grain should be spread out to dry, after which it may be planted or stored.

Oats are especially sensitive to bluestone and in this case it is better to use a solution of formaldehyde, 1 pound to 40 gallons of water, for ten minutes, after which no lime dip is needed. Barley is more sensitive than wheat and should always be lime-dipped after treatment with bluestone.

Garden Pests

By Ernest Braunton

Argentine Ant

The most serious garden pest is the Argentine ant, for it not only protects and encourages the many species of scales, aphids and mealybugs, but combats all beneficial insects that would rid us of these pests. So productive of young are these ants, and they are present in such numbers, that sprays or quick acting poisons are but temporary measures. No. 23 is a slow acting poison that is carried to the nest and fed to young and queens so that the colony is entirely destroyed.

Red Spider

Next in importance and especially bad in dry years and in hot weather, to a degree hardly ever realized by garden owners, is red spider. When leaves turn yellow (and drop) from peach or orange trees, beans, violets, hollyhocks and a long list of plants, red spider is usually the cause. Plants sprinkled daily never get red spider and persistent sprinkling in an effective control. If the weather and soil surface is hot and dry flowers of sulphur will generate fatal fumes that quickly rid plants of the spider, or use 30 (b).

Plant Lice

Aphids or plant lice are bad on many ornamentals, and in the vegetables from artichokes through cantaloupes and on till you come down the alphabet to watermelons. Forty per cent nicotine and resin soap are good, as is nicofume. For the small garden owner nothing is better than the commercial resin soap put up in cans, with printed directions for use on the can labels.

Mealybug

In some gardens mealybug is, next to ants, the worst pest. For this nothing is so good as "fierce" spraying with water. The individaul insect should be hit by the force of the spray. No other remedy is so good, as applications of anything strong enough to kill the bugs at once will also severely injure the plants. Frequent sprayings must be made and in the end the gardener finds water the best.

Black Scale

With black scale, if a professional fumigator is not available, the commercial can of resin soap recommended for aphids is best. It may be mixed at home as in No. 12. Peach curl is prevalent throughout the state in dooryard gardens and Bordeaux mixture in cans or home made as in No. 2 is best.

San Jose Scale

Lime-sulphur as in Nos. 9 and 10 is the second best general fungicide and the best insecticide for San Jose scale which is again become prevalent in garden trees. Spray in winter with lime-sulphur and in spring just before buds swell with Bordeaux mixture.

Mildew

The latter is also effective for mildew, and sulphuric acid, one part to 1,000 of water is also good. If you have but three or four rose bushes, sprinkle with sulphur on hottest days or heat a brick in oven, place under bush and lightly sprinkle with sulphur over all upper surface of brick while it still is hot.

This disposes of the worst of the many pests that harass the home gardener.

STATE AND FEDERAL QUARANTINE

(Continued from Page 311.)

stead of at large in California orchards.

The quarantine inspectors not only meet these incoming vessels but trains and automobiles at the eastern borders of the state. A graphic demonstration was made at the recent state fair where Chief Quarantine Officer Lee A Strong of the department of agriculture showed hundreds of specimens, many of them very injurious insects, which have been taken from incoming automobiles by the five quarantine officers maintained along the eastern boundary. Many an automobile has been found coming into California carrying a bale of hay purchased in the alfalfa weevil districts of Nevada.

The quarantine inspectors wear the badges of the state and federal departments of agriculture. The service is, however under supervision of Director Geo. H. Hecke of the department of agriculture. The personnel of the quarantine service of California is as follows: Sacramento; Lee A Strong, chief quarantine officer. San Francisco; George Compere, quarantine officer; Archie Chatterley, Stewart Chatterly, George Wilson, H. H. Clendenen, A. P. Messenger, S. G. Langford, inspectors. Los Angeles; C. H. Vary, quarantine officer; J. W. Mashmeyer, inspector. San Pedro; A. C. Fleury, J. M. Olsen, inspectors. Calexico; O. A. Pratt, collaborator. San Diego; L. E. French, inspector. Long Beach; Frederick Maskew, collaborator. Border inspectors; Truckee, Paul E. Lewis and A. C. McKinlay. State Line, Ernest Oliver. Reno Junction, F. Roedewald.

Recent Investigations of Dusting for Control of Insect Pests

By A. W. Morrill, Consulting Entomologist

MANY entomologists and plant pathologists in the United States and Canada are conducting investigations of dusting as a substitute for liquid sprays against important pests of fruit, vegetable and other crops. When conditions and equipment at hand give a choice of either method, the mechanical advantages of dusting as compared with liquid spraying have been generally recognized by all who have tried out both methods. Neither dusting nor wet spraying is without its limitations. The dust method of applying insecticides and fungicides has been greatly restricted in the past by the lack of definite knowledge concerning the comparative effectiveness of the various available dry insecticides when applied with air as the carrier instead of water and also by the limited list of insecticides adapted for application in dust form. Investigations conducted during the past few years and now in progress with increasing interest are rapidly advancing the dusting process to its proper place in connection with the control of insect pests and plant diseases.

It is now acknowledged that dusting with insecticides is not merely a substitute for liquid applications. In several cases dry applications have proven practicable when wet applications were impracticable, and in other cases dusting has proved so far superior to wet spraying that the latter is not to be considered as a regular practice. The application of arsenical poisons to cotton in an effective and practicable manner for control of the cotton boll weevil was out of the question as a liquid spray process but dust applications have been demonstrated as successful and are now being widely used under the advice of the bureau of entomology of the United States department of agriculture. The only known method of protecting sweet corn against the attack of the corn ear worm consists in poisoning the fresh silks with a mixture of an arsenical with sulphur or lime.

Among the instances of insect pests in the control of which dust applications have proved distinctly superior to wet applications may be mentioned the walnut aphis, pear thrips, melon aphis, cabbage aphis, cabbage worms and tomato fruit worm.

In general, arsenical poisons may be applied either as a dry or as a wet spray according to the convenience of the grower and the available equipment. Winds are a much more limiting factor in connection with dry than with wet applications. On the other hand, soil conditions following rains or irrigation, sloping land, remoteness of a water supply, and need for covering large areas in a minimum time at critical periods are factors which limit wet spraying and favor dust applications.

Generally speaking, the failures with dust applications in the past have been due to the ineffectiveness of the materials tested. In some instances, we will probably never have insecticides or fungicides in dry form which will be as effective as wet sprays. We have already noted that the reverse is also true in some instances. That dust sprays should have proven successful in connection with such a difficult problem as that of the control of the cotton boll weevil, indicates that this method of applying poisons is by no means one which is limited to the insects which are the easiest to control.

Recent Publications by Investigators

Among reports of recent investigations of dusting experiments it is unnecessary to do more than mention here circular No. 154 of the United States department of agriculture, by Roy Campbell, of the Alhambra laboratory, entitled "Nicotine Sulphate in a Dust Carrier Against Truck Crop Insects." Prof. Essig's circular No. 223 of the University of California experiment station, entitled "The Pear Thrips," likewise needs no detailed review. Leroy Childs, superintendent of the Hood River branch of the Oregon agricultural experiment station, is author of a bulletin dated July, 1920, which gives important results concerning the use of dust and liquid sprays against codling moth. In these Oregon experiments it was found that "the dusting method if properly applied has been found to control effectively scab and codling moth in the Hood River valley. Dusting, Mr. Childs estimated, would cost at 1920 prices $31.77 per acre, spraying with spray rods $33.72 per acre, and spraying with spray guns under 250 pounds pressure, using a 3½-horsepower sprayer, $28.45. It is obvious that dusting, particularly with hand operated bellows dusters, has its proper place in small orchards or home orchards where power sprayers of large capacity are not available.

At the last annual meeting of the American Association of Economic Entomologists, several valuable papers were presented on the subject of dusting vs. wet spraying. These were by Prof. P. J. Parrott, of New York agricultural experiment station, and Dr. T. J. Headlee, of the New Jersey agricultural experiment station, and Dr. A. L. Quaintance, of the United States bureau of entomology. Prof. Parrott reported success in the use of nicotine dusts against three species of apple aphids, the apple red bug, nymphs of apple and grape leaf-hoppers, currant aphis, etc. The pear psylla and woolly apple aphis were reported as comparatively resistant to nicotine dusts. Dr. Headley reported very successful results with nicotine dusts against the apple leaf hopper and the oat aphis on apple, but against the codling moth and apple scab he reported a variability in results with the sulpho-arsenical dusts which he ascribed to the effects of rain. Dr. Quaintance reported results of experiments conducted in many localities throughout the country. In the northern section where codling moth is not especially severe, the investigations of the agents of the department of agriculture working under Dr. Quaintance secured control which was fully as good as that by liquid sprays. In certain other sections the results were "notably less effective" than with liquid sprays.

Investigations in California

At the present time considerable work is being conducted in California with dust insecticides. At the recent meeting of the Pacific Slope branch of the American Association of Economic Entomologists, several papers were presented on the use of dusts against various insect pests. Professor Essig, of the University of California, presented a general review of dust spraying, giving some results of his own recent investigations. Of special interest were his 1921 investigations of "pear thrips" control, which he stated corroborated the results secured the previous season as reported in circular No. 223.

During the past few months, the writer has given considerable attention to experiments with dust applications of insecticides. Special attention has been goiven to the control of the tomato fruit worm and the melon aphis, while valuable information has been secured in connection with many other insect pests.

Dusting for Tomato Fruit Worm

During the past March and April, while on an extended visit to the west coast of Mexico in connection with various entomological projects, considerable attention was given to the control of the tomato fruit worm. This insect which is also known as the corn ear worm and cotton boll worm, occurs practically everywhere in the United States. The damage to tomatoes is unusually severe in the tomato growing sections of the west coast of Mexico, in March and April, 1921, ranging from 12 per cent to 34 per cent of the crop in different fields. It was found that an application of a 50-50 dust mixture of arsenate of lead and hydrated lime gave a two-thirds control. It is estimated that this method of applying the poison if adopted early in the season would have saved fully $100,000 to the tomato growers in one district. In

dusting fully grown plants with about 2100 plants per acre, it was estimated that about 2½ pounds of arsenate of lead were required per acre.

Control of Melon Aphis by Dusts

In connection with experiments in the control of the melon aphis, a favorable opportunity was found for determining the increase in the marketable crop resulting from the control of the aphis. An area of about one-half acre in the midst of a badly infested section of a field was dusted early in July. At the time the application was made the outlook was so discouraging that it did not seem likely that any of the plants would survive to produce marketable melons. Six weeks later, however, at the beginning of the harvesting season, a careful survey of the dusted plants and the immediately adjoining undusted rows showed that the increase in the number of marketable melons due to the dusting amounted to approximately 75 per cent. The undusted plants in this section of the field did not pay expenses, while the dusted plants are still setting fruit and will make practically a normal crop.

Experiments conducted in the Imperial Valley as well as in Los Angeles County served to emphasize the importance of early season scouting for the melon aphis. In a successful campaign against the melon aphis it is very essential that the earliest infestations be located and that as the season advances the dusting operations be extended to keep the infestation well in hand at all times. Conditions in the Imperial Valley were unusually favorable for the spread and multiplication of the melon aphis during the past cantaloupe season. Cool weather restricted the increase of parasites and high winds served to spread the winged adults. Dusting with nicotine dust was extensively tried by the growers but in most cases the early season treatments were neglected. The ladybugs were present in large numbers in the melon fields visited but very few eggs were being laid and it was obvious that the adults were not destroying enough of the aphids to contribute appreciably to effective control. It was observed that their most effective work consisted in cleaning up the surviving aphids after the dust treatment.

Nicotine Dust for Woolly Apple Aphis

While nicotine dusts have been reported as comparatively ineffective against the woolly apple aphis, preliminary tests made by the writer have shown a remarkable susceptibility to a dust containing over 1.6 per cent nicotine with hydrated lime as a carrier. Although only a few trees have so far been treated, results have been uniformly successful. In the experimental work a hand operated bellows duster was used. This type of duster is better suited than any other for treating the woolly apple aphis on the trunks and branches of trees, owing to the fact that the insects occur in distinct colonies around the edges of cuts on the trunks and branches, also on the smaller twigs. This type of machine therefore permits the operator to send dust directly towards the infested parts of the tree. When a suitable dust is used this method of control is believed by the writer to be far more economical and effective than the use of wet sprays.

FORMALDEHYDE PREVENTS SMUT ATTACK

There is no insurance which is cheaper and really easier to buy and apply than protection against loss from smutty wheat. To treat the wheat all that is necessary is to first fan the wheat to remove light and smutty kernels or, in case there is no fanning mill available, the wheat can be slowly thrown into water. The heavy kernels will sink and the light ones can be skimmed off the surface of the water, the object being to get the sound, heavy kernels for seed and to treat only the sound heavy seed.

This information is furnished by Alvin Kezer of the Colorado agricultural college in response to numerous inquiries which have been received lately from farmers of the state.

The easiest method of treatment is to use formaldehyde, one pound of formaldehyde to 40 gallons of water. There are machines for treating the seed, but perhaps on most farms the easiest way is to put the seed in a wagon box or on the floor or canvas and sprinkle the same with the freshly made formaldehyde solution. The pile of grain should be sprinkled, then turned with a shovel, much as concrete is mixed, repeating the sprinkling and turning until the outside of all of the grain is moist. The pile of grain should then be covered up and allowed to stand for about two hours, when it should be uncovered and the air be permitted to circulate over it. If the seed is left covered up too long the germination of the wheat itself will be damaged.

Formaldehyde treatment will kill all of the smut spores on the outside of the wheat kernels. But it is possible to re-infect the seed if the drill is dirty or if the sacks used to carry the grain to the field are dirty from smut. The precaution should, therefore, be taken to either treat the sacks and the drill or to wash them out thoroughly. The easiest way is to use some of the formaldehyde solution and spray the inside of the drill and dip the sacks that are to be used, so that smut will not be put back onto the grain seed.

It will only cost about 50 to 75 cents an acre to carry out the complete process of treating to prevent smut where all labor is charged. This is very cheap insurance, because it may mean the difference between no crop at all and a practically perfect crop. All seed wheat should be treated.

GRAPE SCALE

According to Prof. E. O. Essig of the state university, there appears to be no published record of the occurrence of grape scale (Aspidiotus uvae Comst), in California. Specimens were collected from the American vine of the Catawba variety at Oakland, November 7, 1919. The scales of this pest were abundant upon the old canes as well as on the one year old wood, and were usually hidden under the bark of the host plant. Although the scale insects found attacking the grape appear to be numerous, practically none of them are of any importance in commercial viticulture, but some are at times very troublesome in small household vineyards.

In the province of Chaco, Argentina, there are more than 100,000 mandarin orange trees, also lemons and Seville oranges, according to a late report of the Argentine minister of agriculture. "Chaco is admirably suited to the cultivation of citrus trees, which grow very large and yield abundant crops, an orange tree producing 1500 to 5000 and even 8000 oranges there. Of diseases and enemies are to be noted gummosis and the scale insect, Mytilaspis citricola; up to date this latter has not caused much damage."

Some Important Developments in Spraying and Dusting

By F. A. Frazier

DUST spraying is not new. The dusting method for the control of lice has been practiced by the feathered creation ever since the first hen laid the first egg.

This revival of interest in dusting is already making available to the fruit grower and the farmer the best features in both methods. There should be no rivalry nor conflict between liquid spraying and dusting. Each has its place in the economy of farm and orchard operations. The day is near at hand when every well equipped farm and orchard will have a dust machine and a spray pump just the same as they have a plow and a disk.

The causes of the apparent failures in dusting in the past are being discovered. The knowing how to dust is being recognized as just as essential as knowing how to spray. Up-to-date experiment stations will no longer be dividing hairs as to which is better, the liquid spraying or dusting, but will undertake to teach when and how to dust, and what kinds of materials to use. Already the work done by investigators from such institutions as the University of California and Cornell of New York has put the dusting method for certain purposes beyond the experimental stage. The investigation of this method has been taken up by the United States department of agriculture and by the Canadian department of agriculture, with the result that today the dusting method stands equal in point of effectiveness with liquid spraying for such insect pests and plant diseases as codling moth on apples, pears, and walnuts; scab on apples and pears; walnut aphis and pea aphis, and most all aphids except the woolly varieties; thrips on pears, prunes, and cherries; red spider on trees and field crops.

The development of nicotine impregnated materials is responsible for the successful control of aphids and thrips by dusting. Investigations in the past season have brought out marked improvement in dusting material combinations, such as sulphur in the nicotine dust materials, wherein the sulphur is shown to greatly increase the effectiveness of the nicotine.

In the Eastern states and in Nova Scotia, a dust material made by dehydrating copper sulphate and combining it with lime dust, is proving a most valuable fungicide. Professor G. E. Sanders, Dominion entomologist, in charge of insecticide investigations in Annapolis Valley in Nova Scotia, is responsible for the development of the dehydrated copper sulphate and lime dust mixture, and he has brought it into general use in Nova Scotia for apple scab control.

Professor Sanders has also discovered the cause of serious injury resulting from the use of lime-sulphur sprays, particularly where heavy dropping of apples has resulted from the lime-sulphur sprays in common use. Injuries following the use of such sprays had become so pronounced that their use has been abandoned, and in their stead the Nova Scotia orchardists have adopted the soluble compound of sodium and sulphur as being far safer and, at the same time, equally effective as the lime-sulphur for dormant and pre-bloom sprayings.

In the southern peach growing districts the dusting with sulphur is being found the most satisfactory control for the peach brown rot. It has been found that the sulphur dusting of peaches shortly before picking insures their keeping better while in cold storage before being put on the market. Dusted fruit is being demanded by the New York buyers because of its cleaner appearance and the freedom from excess spray residue. This latter point should have some significance to the pear grower of California.

It should not be inferred that failures have not attended efforts with dusting, the same as with liquid spraying, in the past. The greatest care must needs be exercised in the selection of very fine dusting materials. Fineness is all important. The manner of application is easily understood. The time of application is of considerable importance. Dusting at night is coming strongly into favor. The heavy night air, even in the drier regions, is conducive to better distribution of the dust material. No one will be found seriously objecting to doing the work at night when the advantages in the method are borne in mind.

The intelligent fruit grower and farmer will surely want to make use of this method for its known advantages, and will be alive to the unbounded possibilities in its future development.

Three New Records

With "Calispray" Dusts and an American Beauty Dust Sprayer

Dr. A. W. Morrill, Consulting Entomologist, reports the results obtained in his recent experiments with "Calispray" Dust and the American Beauty Dust Sprayer as follows:

"**Melon Aphis:-** Beginning dusting treatment in mid-season when aphis infestation was exceedingly bad resulted in increase of 75% in marketable crops of melons.

"**Tomato Fruit Worm:-** Dusting with American Beauty Dust Sprayer using arsenate of lead and hydrated lime prevented two-thirds of damage. Best results reported with wet spray with thorough experimental application gave only 50% control.

"**Woolly Apple Aphis:-** Very susceptible to 'Calispray' Dust No. 1. A much more practicable and effective method of controlling pests above ground than liquid spraying."

The American Beauty Dust Sprayer is operated by one man and places the dust only where needed and in its most efficient form. In orchard work 15 acres a day may be covered, with larger acreages in field or vineyard. For best results use "Calispray" Dusts made in our own factory for the Ameircan Beauty Dust Sprayer—brands ready prepared for insect and fungus pests.

Household Department

THE QUITTER

When you're lost in the Wild, and you're scared as a child,
And Death looks you bang in the eye,
And you're sore as a boil, it's according to Hoyle
To cock your revolver—and die
But the code of a Man says: "Fight all you can,"
And self-dissolution is barred.
In hunger and woe oh, it's easy to blow—
It's the hell-served-for-breakfast that's hard.

"You're sick of the game.." Well, now, that's a shame.
You're young and you're brave and you're bright,
"You've had a raw deal..' I know, but don't squeal.
Buck up, do your damnedest and fight.
It's the plugging away that will win you the day.
So don't be a piker, old pard!
Just draw on your grit it's so easy to quit;
It's the keeping-your-chin-up that's hard.

It's easy to cry that you're beaten—and die;
It's easy to crawfish and crawl;
But to fight and to fight when hope's out of sight—
Why that's the best game of them all!
And though you come out of each gruelling bout,
All broken and beaten and scarred,
Just have one more try—it's dead easy to die,
It's the keeping-on-living that's hard.
—Robert W. Service.

FOOD PESTS AND GERMS AND THEIR CONTROL

By W. V. Cruess, University of California

DRIED fruits are often infested in the household with insects, the most common of which is the Indian meal moth, Plodia interpunctella. There are two very simple methods of controlling this pest in the household. Fruits or vegetables which have been dried in the sun should be immersed in boiling water for about one minute before they are put in the container for storage. The products must be very dry in order that the dipping process shall not cause them to absorb enough water to become moldy. In other words, the fruit should be dry enough to rattle on the trays. The one minute's immersion in boiling water will destroy the eggs of insects which are inevitably and invariably deposited on fruits which are dried in the sun. Fruit may also be disinfected by the use of carbon busulphid, which may be obtained from any drug store. In using this material the fruit may be packed loosely into a large stoneware jar or wash boiler and the carbon bisulphid poured in a saucer which is placed on top of the dried fruit. The jar or wash boiler should then be covered as nearly air tight as possible and allowed to stand for 24 hours or longer. The fruit may then be removed and packed in insect proof containers.

(Caution: Carbon bisulphid is extremely inflammable and explosive, therefore do not bring lights near the fumigating receptacle.)

Fruits and vegetables that have been treated by hot water or by carbon bisulphid should be put in containers that will exclude insects. Old coffee cans or old tea tins or other tight containers are suitable. Fruit that has been dipped in boiling water may be allowed to drain for a half hour before packing. Fruits and vegetables that have been dehydrated in small household or large commercial sized plants do not require special treatment to kill insects provided they are packed immediately after they are taken from the dehydrator. At the present time there are several hundred household size evaporators in use in various parts of the state.

Mold in Dried Fruit

Dried fruit which contains too much moisture at the time of packing will become moldy. If the development of mold has not proceeded too far the fruit may be spread in the sun or placed in the oven and dried sufficiently to keep. It is recommended, however, that fruit infested with mold be dipped in boiling water for at least one minute in order to kill the mold. It may then be dried sufficiently to preserve it. Peaches and apricots that have started to become moldy may be saved if they are plunged in boiling water for a few minutes and then sulphured in the fumes of burning sulphur. The sulphur is a very strong germicide.

Mold on Jellies, Jams and Preserves

If these products are not boiled down sufficiently they may develop mold. It is recommended that in their preparation a thermometer be used and that all jellies, jams and preserves be boiled to 220 or 221 degrees Fahrenheit. This will insure that they contain enough sugar and a small enough proportion of water to keep indefinitely. Should mold appear on jelly or preserves it should be skimmed off and the product recooked. If a jelly, preserve or jam less sweet than is customary is desired the product may be boiled to a lower temperature than 220 provided that it is sealed scalding hot in jars in the same manner that fruit is sometimes put up. This will sterilize the product and exclude mold so that a high concentration of sugar is not needed.

Mold in Fruit Juices

In the home preparation of fruit juices it sometimes occurs that mold will develop in some of the jars or bottles. Where this happens the bottle or jar may be opened and mold removed and the product sterilized in a sealed container at 175 degrees for 30 minutes.

Souring of Canned and Preserved Fruits

Jellies, jams, preserves and canned fruits often become "sour," a term which ordinarily means in the household, yeast fermentation. When this occurs in jellies, jams and preserves it means that the products have not been cooked down sufficiently or that they have not been sterilized in the sealed containers. The remedy is the same as that given for the molding of jellies, jams and preserves above.

In canned fruits it may mean yeast fermentation or perhaps Bacillus botulinus. The yeast growth will develop an alcoholic odor whereas botulinus usually gives warning by the development of a sour cheese odor. In either case it is recommended that the product be not tasted until it has been thoroughly boiled. The souring of canned fruits or vegetables is an indication that the jars are not properly sealed or that the product has not been sufficiently sterilized. It is recommended that fruits be sterilized in the jar or wash boiler or similar sterilizer for at least 20 minutes after the water in the boiler has begun actively boiling. This will avoid souring in the jar provided good rubbers and caps are used.

(Caution: Never taste soured canned or preserved fruit until they have been boiled.)

Spoiling of Canned Vegetables and Meats

Vegetables and meats are very difficult to sterilize and unless the home canner uses a pressure cooker she will have a large number of soured jars or cans in most cases. Pressure cookers may be obtained from most hardware stores or large grocery stores and will be found very useful, not only for canning purposes, but for cooking purposes as well. If a pressure cooker is not available it is recommended that the vegetables be canned in acidified brine. That is to say, pack the meats or vegetables into a jar loosely—do not pack them too tightly. Add a boiling hot brine consisting of three level tablespoons of salt and ¾ cup (six fluid ounces) of lemon juice per gallon of water. Sterilize the jars and contents in the wash boiler sterilizer for two hours for vegetables and three hours for meats. Boil products thoroughly before serving.

(Never taste sour canned vegetables or canned meats until they have been boiled for at least 30 minutes.)

Soft Pickles

Home made pickles often soften or become moldy or slimy, usually because insufficient salt has been used. Souring will often occur also if the product is not sealed in air tight containers to exclude air and mold. Dill pickles will usually not become soft if the brine used in their preparation is acidified with about one-half pint of vinegar to a gallon of water. The brine used for dill pickles should also

The Cultivator Patterns

3726. Girl's Dress—Cut in four Sizes: 4, 6, 8 and 10 years. An 8 year size will require 2⅝ yards of 36 inch material. Price 10 cents.

3740-3727. A Pretty Evening Gown—Waist 3740 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3727 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress as illustrated will require for a medium size, 4⅛ yards of plain and 3¼ yards of figured material 32 inches wide. Of one material 44 inches wide 6 yards will be required. The width of the skirt at the foot is about 2¼ yards. TWO separate patterns 10 cents FOR EACH pattern.

3724. Junior Dress—Cut in three sizes: 12, 14 and 16 years. A 14 year size will require 6 yards of 27 inch material. To make as illustrated will require 1¾ yards of plain and 4⅛ yards of figured material. Price 10 cents.

3374. Ladies House Dress—Cut in seven sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size will require 6 yards of 36 inch material. Price 10 cents.

3549. Boy's Play Suit—Cut in four sizes: 2, 3, 4 and 5 years. A 4 year size will require 2½ yards of 36 inch material for the Overalls and 1½ yards for the Blouse. Price 10 cents.

3312-2939. An "Up-to-Date" Frock—Waist 3312 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Over Dress 2939 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. To make the waist will require 2⅛ yards of 36 inch material. The Over Dress requires 3½ yards of 40 inch material. TWO separate patterns 10 cents FOR EACH pattern.

3722. Girl's Dress—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 4 yards of 38 inch material. Price 10 cents.

3738. Ladies' Apron—Cut in four sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A medium size will require 2⅞ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

contain about a half a pound of salt to the gallon. Where pickles have become soft it is advisable to bring them to the boiling point in water in which there is dissolved about two tablespoons of alum per gallon. Ordinarily brine in which the pickles have been stored should also be boiled and returned to the pickles after they have been removed from the alum solution. If sour pickles tend to become soft transfer them to new vinegar and at the same time heat them to the simmering point for one or two minutes.

NEW SUNSWEET RECIPES

Here are some of the new Sunsweet recipes selected by the California Prune & Apricot Growers for 1921-22. All are tested and found delicious. Others will be given later in this department. They are worth trying and filing.

Prune Salad—Pineapple Dressing

Cooked Sunsweet prunes, pitted and drained; allow 4 prunes and 1 slice of pineapple for each service. Place the pineapple on crisp lettuce leaf. Fill prunes with a small portion of salad dressing and arrange around the pineapple. Place a spoonful of dressing in the center on the pineapple and sprinkle with chopped walnuts. For dressing melt 2 tablespoons of butter, add 2 tablespoons of flour; ½ teaspoon salt; ¼ teaspoon dry mustard, and mix well; cook until frothy, then add 1 cup of pineapple juice and 1 teaspoon lemon juice. Pour over 1 well beaten egg or 2 egg yolks. Cool. A half cup of whipped cream may be added.

Prune and Orange Cocktail

Drain and remove pits from cooked Sunsweet prunes and cut in quarters. Allow ½ orange and 4 prunes for each service. Cut oranges in half and remove the pulp with a spoon, discarding all membrane. Mix prune and orange pulp, add a little lemon juice and sweeten if necessary. Serve very cold in sherbet glasses or in the orange shells.

Apricot Square

Two cups sifted flour; 1 teaspoon salt; 4 teaspoons baking powder; 1-3 cup sugar; 1 egg beaten; ¼ cup shortening; about ½ cup milk; 1 pound Sunsweet (dried) apricots. Wash and soak apricots in warm water for several hours. Sift all dry ingredients; rub or chop in shortening; add beaten egg and milk gradually, mixing with knife to consistency of biscuit dough. Turn on slightly floured board, roll about ½-inch thick to fit shallow greased baking pan. Drain apricots, arrange in even rows over entire surface of cake. Sprinkle with sugar; bake in medium hot oven about twenty minutes. Cut in squares and serve hot or cold.

Suprise Charlotte

Take 1½ cups Sunsweet (dried) apricot pulp; 2 cups whipped cream; 1-3 cup powdered sugar; 1 teaspoon vanilla; lady fiingers. Whip cream, add sugar and vanilla; line individual serving dishes with lady fingers; add whipped cream—keeping a well in the center; fill center with apricot pulp, then cover top with whipped cream; sprinkle with chopped nuts. Serve very cold.

Prune Pie

Two cups Sunsweet prunes; 1-3 cup sugar; 2 teaspoons butter; 2 tablespoons flour; 1 teaspoon lemon juice. Wash Sunsweet prunes and soak in cold water to cover two hours or more. Cook slowly in same water until soft. Remove stones, cut in quarters, and mix with sugar and lemon juice. Line plate with pastry, cover with prunes, pour over prune juice, dot with butter, dredge with flour, put on upper crust and bake in moderate oven.

Prune Cream Pie Filling

One cup Sunsweet prunes put through coarse sieve; ½ cup chopped walnuts; 1 cup scalded milk; 2 eggs; 1-3 cup sugar; 1 teaspoon flour; 1 teaspoon vanilla. Mix sugar and flour; add to beaten eggs; pour the scalded milk over the egg mixture. Add Sunsweet prune pulp and walnuts, mix well and pour into a pan lined with pastry; sprinkle nutmeg over the top. Bake as for custard pie.

Prune Sweetmeats

Wash Sunsweet prunes and bake in a slow oven until plump. Do not add water. Cool, remove pits. Mix finely chopped walnuts or pecans with enough orange marmalade to make a paste. Stuff prunes with mixture. Brush prunes with unbeaten egg white and roll in powdered sugar, or dip in melted sweet chocolate.

Prune Patties

One-half cup Sunsweet prune pulp; 1 tablespoon sugar; 1 teaspoon flour; ⅛ teaspoon salt; ¼ teaspoon nutmeg; 1 yolk egg; ½ cup scalded milk. Beat yolk of egg; add sugar, and remaining dry ingredients, line 6 patty pans with flaky pastry, fill with the mixture. Bake in a medium hot oven until firm. Cool slightly, cover with meringue made of stiffly beaten egg white and 2 tablespoons sugar. Bake in slow oven eight minutes.

There are many thoroughly satisfactory proprietary remedies for household pests, which are offered for sale in convenient and economical form.

Stuffed Prunes

Wash Sunsweet prunes in warm water, dry, remove pits and set in a warm oven until plump. Then, fill centers with marshmallows.

HINTS FROM HOUSEKEEPERS

Prune Recipes

In recent Cultivator a subscriber asks for a few prune recipes. I'm a prune grower and delighted to help you.—Mrs. P. Ferran, Napa.

Prune Cake—1½ cups sugar, 3 tablespoons butter or other shortening, 4 eggs, 4 cups flour, 3 tablespoons ground chocolate. Moisten with hot water with 1 cup sour milk in it, a teaspoon baking soda, 1½ cups stewed prunes, 1 teaspoon each mace and ginger, also 1 teaspoon baking powder. Filling—1½ cups stewed prunes, juice 2 lemons. Set on stove and add sugar to taste and cornstarch to thicken. Spread between layers. Instead of icing use powdered sugar, or boiled icing is nice and a little icing on filling is very delicious.

Another Prune Cake—1½ cups butter, cream with 1½ cups sugar, 3 eggs well beaten, 3 cups flour sifted with 3 teaspoons baking powder, 1 cup prunes, 3 tablespoons chocolate moistened with a little boiling water, ¾ cup milk, ¼ cup prune juice.

Prune Pie—Line pipe plate with pie crust, fill with stewed prunes, a little juice, mace, cinnamon, nutmeg. Cover with crust and brown.

Prune Tarts—Take rich pie crust. Cut in squares. Put in three or four stewed prunes, little sugar, spice if you like, roll over edges as you do apple dumpling. Bake brown. Very nice when putting up lunches.

Prunes may be used in steamed puddings, also in bread. The housewife will find this a saving.

A little lemon added when stewing prunes improves the flavor.

Take nice prunes. Remove pits, place a piece of walnut in center of each, roll in powdered sugar.

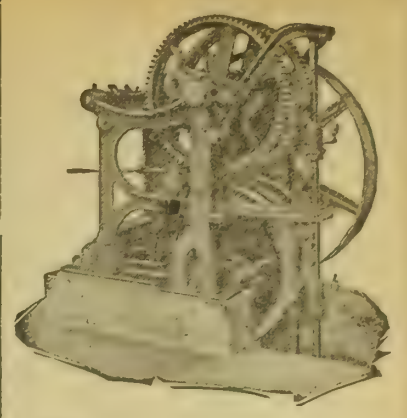
Chopped prunes are very nice in fudge.

Use Sunsweet prunes for good results.

More Good Prune Recipes

Prune Pudding—Heat a little more than a pint of sweet milk to the boiling point, then stir in gradually a little cold milk in which you have rubbed smooth a heaping tablespoon of cornstarch. Add sugar to suit your taste, 3 well beaten eggs, 1 teaspoon butter and a little nutmeg. Let this come to a boil, then pour in a buttered pudding dish, first adding cup of stewed prunes which have been stoned. Bake for 20 minutes. Serve with cream.

Prune Fluff Tart—20 medium sized stewed prunes, 3 egg whites, 6 tablespoons sugar, pie crust. Stone the prunes and press through coarse sieve. Beat whites of eggs until stiff and add sugar gradually, then add prune puree



Pomona

SEAFORD, DELAWARE

and beat thoroughly. Add lemon juice, if liked. Have ready a partly baked under crust and pour in the prune mixture. Bake about 20 minutes, chill and spread lightly with whipped cream.

Prune Cake Filling—Drain cooked prunes, remove stones and measure 1 cup chopped fine. Add one-third cup orange marmalade, one-third cup finely chopped walnuts, 1 teaspoon lemon juice. Mix well and spread between the layers. This can be used with the usual layer cake recipe.—Mrs. Lilly M. Robertson, Kerman.

Spanish Omelet

This recipe for Spanish omelet has long been a favorite dish in our family: Ten eggs well beaten, 1 level teaspoon salt, pepper to suit, one-half cup milk. Add milk to eggs, salt and pepper and cook until eggs are set.

In another kettle cook until done: 6 ripe tomatoes or one-half can of tomatoes, 1 chile pepper chopped fine, 1 medium sized onion chopped fine, 1 clove garlic (if you like it), I teaspoon salt. Thicken with 1 tablespoon butter mixed with 1 tablespoon flour. Place omelet on platter and pour over it tomato sauce. This serves six persons.—Mrs. J. Freeman, Pond.

Two Canning Hints

This is the season for preserving and canning and I wish to tell the women readers two things. One is when scalding tomatoes to can; the other is how to make first class preserves.

Place tomatoes in a ripped sugar sack or other thin muslin. Dip in quantity of boiling water until skin slips, then dip into cold water. This prevents the skin from tightening as they cool.

When making preserves or spiced fruit never let them cease boiling after they begin. You will find it less work and the preserves will be lighter in color.—A Subscriber.

Brined Cucumbers—Fig Preserves

We have read the Cultivator with the greatest pleasure and benefit for six years and I have found especial help in the cooking and canning recipes in the home department. I am sending two tested recipes my mother used in Wisconsin, and I have used in California for 16 years.

Brined Cucumbers—Pick your cucumbers about four inches long, wash and pack in layers. Over each layer sprinkle a handful salt. Continue till crock or keg is two-thirds full, or as many as you can pick every other day. Put on earthen plate or board made round to fit crock or keg and put stone or heavy weight on to keep cucumbers submerged. The salt and pickles will make their own brine and will keep all winter.

Fig Preserves—Pick soft, ripe figs. Peel and skin. Put in granite kettle. Add about half or one-third as much sugar as figs. If figs are very sweet one-third is enough. Let stand over night in a cool place and they will make their own juice. Next morning stir with spoon, place on slow fire and let simmer 2 hours. Add a few slices of lemon and boil half hour longer. Put in fruit cans and seal hot. Will keep for years.—Mrs. W. H. Dyar, Fillmore.

Correction

An error was made in printing recipe for soft cookies sent by Mrs. Lilly M. Robertson of Kerman. We give correct formula below:

Soft Cookies—1 cup butter or shortening, 1½ cups sugar, 2 eggs, 3 tablespoons milk, 1 teaspoon baking powder, just enough flour to roll to a soft dough. Sprinkle with sugar before rolling. Cut in rounds, bake in quick oven.

ADDRESS WANTED

If Mrs. A. Muscio will send her address to Household Department, California Cultivator, Los Angeles, she will be credited with extension of subscription for material contributed to this department. We have label with name and R. F. D. number but not the name of the town in which she lives. As our subscribers are listed by towns, not by names, it is necessary to have this information before credit can be given.

HOUSEHOLD HELPS?

A little glue added to jelly will make it stiffer.

Hard-boiled eggs will not scorch or burn if stirred now and then.

Moths will not eat copper window screens.

Red ants can be killed by running them through a laundry wringer.—Cincinnati Post.

VIVID IMAGINATION

"Have you heard Jibway's latest fishing yarn?"

"No, I haven't," said Mr. Gadspur, "and I don't want to heart it."

"Why not?"

"Because Jibway hasn't even a speaking acquaintance with the truth. He couldn't describe a smallpox epidemic without making you think it was something you'd hate to miss."—Birmingham Age-Herald.

STARTING OFF RIGHT

"Stop the baby!"

"What's he doing?"

"Tearing the pages out of the new novel you brought home."

"Let him alone. That boy shows such destructive tendencies where literature is concerned I'm sure he'll be a famous book reviewer some day."

HOW TIMES CHANGE

"Times have changed," sighed Uncle Bill Picklestew.

"What makes you think so?"

"A little family party I attended last night. The women folks talked politics while the men folks got off in a corner and exchanged recipes."

Household Pests

By W. B. Herms, Professor of Parasitology, University of California

INTELLIGENT action against pests is based on a knowledge of their life history and habits. In other words, the common question "Where do they come from?" is basic in its importance. Strike at the heart of the trouble and results are sure to follow. It is not the purpose of this brief article to discuss all our commoner insect pests, let alone such four footed pests as rats and mice, neither will it be possible to discuss fully the nature and extent of the damage done. Suffice it to say that aside from their pestiferous habits, great financial loss is accomplished because of damage to foodstuffs, household goods, etc., in addition to considerable sickness that may be traced to certain insects such as mosquitoes, flies, cockroaches and the like.

Clothes Moths and Carpet Beetles

Although there are several species of clothes moths, in general it may be said that they are brownish yellow moths about half an inch in length, commonly seen to dart out of dark corners of clothes cupboards when clothing is disturbed. They lay their tiny glistening eggs in the folds of certain garments such as woolens and heavy fabrics. The eggs generally hatch in a little over a week and the larvae may be recognized as tiny caterpillars among a loose web which they spin, particularly when about to pupate. The larvae of the carpet beetles are hairy grubs with a long brush or tail of spines. They are most likely to damage furs and woolen garments. Obviously these pests thrive best when there is little disturbance, which means that little or no damage may be expected if clothing is frequently handled, brushed and exposed to sunlight. Storage during the summer in tightly sealed boxes or bags is effective provided the clothing is not infested before storage. Cold storage at about 40 degrees Fahrenheit is commonly practiced with good results. Old woolens, etc., should not be allowed to accumulate in clothes presses, attics, etc. To destroy the insects fumigation with carbon tetrachloride is suggested, using 6 pounds to 100 cubic feet of space. To fumigate put the insecticide in a large shallow pan and place the pan on hot soap stones, seal the closet with water soaked paper strips and allow to evaporate for about 24 hours.

Superheating, preferably with an electric heater, to a temperature of 130 degrees Fahrenheit for about 20 minutes is a method which has also given good results. Infested carpets should be taken up and beaten thoroughly out of doors where the infested spots may be sprayed with benzine. Pressing the infested spots with a hot iron over a damp cloth invariably gives good results in cases of local injury.

Bedbugs

The bedbug is a common visitor in bunk houses, transient lodging houses and often times in the "best regulated households." The full grown "bugs" are oval, reddish brown, wingless insects, flattened to facilitate their entrance into narrow crevices and possessed of a characteristic odor that often signals their appearance.

They are nocturnal in their feeding habits, hiding away during the day in any place that is fairly dark and which furnishes them with an opportunity to crowd themselves into a small crevice. The cracks of wooden bedsteads, the cracks of a wooden floor, behind baseboards, and torn wall paper are favorite places of refuge. The female lays from 75 to 100 eggs in her hiding place, which hatch in about a week into tiny bedbugs closely resembling the adults except for size. From 45 days to a year is required for the development of the adult stage, depending on the availability of food. Eight to ten weeks generally suffices.

If many rooms are infested fumigation is generally the most satisfactory method of control. Hydrocyanic acid gas (cyanide) is the most efficient fumigant for this pest, but its use should not be attempted by an amateur. Sulphur fumigation accomplished by burning 4 pounds of flowers of sulphur for every 1,000 cubic feet of room space is satisfactory if all tarnishable metals and vegetable dyed materials are removed and care is taken to carefully avoid all leakage by stopping cracks and keyholes with wet paper. Gasoline or corrosive sublimate (1 to 500 solution) applied to bedsteads, floors and other hiding places are efficient. The corrosive sublimate preparation should be applied with a mop. In case it is necessary to apply by hand rubber gloves should be worn to protect the skin. For mattresses, bedding and like materials, no treatment is superior to steam sterilization where the necessary facilities are at hand. By use of this medium death to all stages is accomplished in a few moments if the steam has direct access to the insects. Where large bundles or piles of mattresses are placed in a steam sterilization chamber it is necessary to produce a partial vacuum followed by 15 to 20 minutes exposure to steam at 20 pounds pressure.

Where it is possible to heat the infested apartments to 130 degrees Fahrenheit, as is often the case in the summer time in buildings equipped with a heating plant, the maintaining of this temperature for a couple of hours generally gives good results.

Infested bedsteads that can be taken down are often dipped in vats of corrosive sublimate solution or, if metal, fine results are obtained by heating all parts with a plumber's blow torch until the paint starts to blister, care being taken not to overlook the springs at the time of treatment.

Fleas

While there are several species of fleas, the great majority of them interchange hosts, i. e., the cat and dog flea is just as likely (if present) to attack humans as cats and dogs. The same holds true for the human fleas, etc. Hence the following general statements will apply:

Fleas may deposit their eggs on the infested animal, but more eggs are deposited off the host than on the host, and in the absence of a sticky secretion practically all fall off when the animal shakes itself. A flea deposits as a rule from 15 to 25 glistening white eggs. These hatch ordinarily in less than a week. The larvae are very active, sparsely haired maggots about one-fourth inch long when full grown and subsist on faecal matter, dry blood, decaying vegetable matter, etc. In three or four weeks the larva (maggot) spins a cocoon and pupates. The entire life history, i. e., the period from the egg to the appearance of the adult flea, is passed in from four to six weeks or over.

The control of fleas is rather closely linked with the presence of domestic pets, either as regular entrants to the house or as itinerant visitors to the basement. Rats and squirrels also fall in this latter category. Poultry yards on or near the premises also demand attention. The exclusion of all animals from the basement, the periodic treatment of poultry yards and the regulation of dogs and cats permitted in the house constitute the preventive measures.

Domestic pets may be rid of fleas by frequent dusting with fresh pyrethrum powder, care being taken to rub the dust thoroughly into their coats and to perform the process in such a place that all fleas dropping from the animal may be gathered up and burned, as many are merely stupefied and will recover in a short time. Small animals may be successfully treated by washing with a heavy lather of naptha soap, wrapping the animal when well lathered in a towel for ten minutes, after which a thorough rinsing is given.

Mats upon which dogs and cats sleep should be shaken out over kerosene or fire every few days in order to destoy the eggs and larvae. Next, all carpets and matting of the old fashioned type, tacked down and covering the entire floor, must be dispensed with (rugs may be substituted) unless an insecticide can be found which may be applied to the carpet in wetting

quantities without producing injury to the fabric. With the removal of the carpets and matting the floor can easily be run over with a "dry" mop moistened (not soaked) with kerosene. All parts of the floor in all parts of the house must be reached. The odor of kerosene is not particularly disagreeable and at all events will soon leave. Treatment should be repeated at least once every three or four weeks during the flea season. If properly applied this method will certainly control the fleas.

Fleas also breed abundantly in the loose manure and debris in stables, hog pens, chicken houses, etc. Treatment with a high flash point light crude oil, fuel oil or kerosene is recommended. This is applied to the floors and ground in the form of a spray.

To treat barnyards, basements and floors of outhouses, kerosene may be applied by means of an ordinary hand spray pump, the kind commonly used for garden purposes.

Ants

Although there are a number of native species of house infesting ants, the most persistent and abundant is the introduced Argentine ant which is gradually becoming state wide in its distribution. The Argentine ant because of its aggressive habits soon supersedes the native ants and swarms in countless numbers wherever it finds suitable food. If cold meats, fat or other fatty substances are available it will be found that such food is attacked in preference to sweets, although practically all kinds of foods are overrun.

The habits of the Argentine ants differ from those of our native species in several important respects which make control somewhat more difficult. They are particularly migratory, in that the whole colony will move from place to place seeking shelter in crevices in the soil, back of baseboards in piles of bricks or stones, under boards, and elsewhere, and each colony has a large number of queens, recognized by their large size. If the colony can be located, great good can be accomplished by applying a quantity of kerosene or gasoline or boiling water.

Argentine ant poisons contain less arsenic than the usual ant poisons, for the reason that this weaker poison is carried by the workers to the queens, which they feed by regurgitating the poisoned honey or syrup. Thus eventually the entire colony is exterminated. For ordinary use the following formula is recommended:

	Quantity Large	Small
White arsenic	1 oz.	1 scruple
Caustic soda	1 oz.	½ tspoon
Sugar	20 lbs.	1 lb.
Water	3 gals.	1 pt.

For use on a larger scale the United States department of agriculture recommends the following formula:

Granulated sugar, 9 pounds.

Water, 9 pints.

Tartaric acid (crystalized), 6 grams.

Benzoate of soda, 8.4 grams.

Boil slowly for 30 minutes. Allow to cool.

Dissolve sodium arsenite (C. P.), 15 grams, in hot water, ½ pint.

Cool. Add poison solution to syrup and stir well. Add to the poisoned syrup:

Honey, 1¼ pounds.

Mix thoroughly.

The poison is placed in perforated tin cans (baking powder cans), or perforated paraffined paper bags or cartons, containing a small sponge, which are placed outside the house near the foundation walls or under shrubbery near the house. In addition to this poison, if more immediate results are desired indoors, a powder consisting of sodium fluoride (ant and roach powder) may be freely dusted wherever the ants have their runways.

Flies

The housefly lays from 75 to 125 shiny white eggs, each just about visible as a tiny glistening speck. These eggs are placed in clusters usually upon fairly fresh warm horse manure, or cow manure well mixed with bedding, never the dry manure as it occurs near the edge of the heap, a point to be remembered. From these eggs there hatch in from eight to 48 hours tiny maggots which, while in the manure, grow rapidly, reaching full growth, about half an inch in length, in four or five days, when they crawl away from the warm, moist manure and out into the dry portions of the heap or entirely away from it, burying themselves in loose earth beneath rubbish, where their outer skin becomes shrunken and chestnut brown in color, thus forming the inactive pupa or resting stage. In this brown case the insect develops its wings, legs, feet and all other parts that go to make up a fly. This requires from four to five days during the hot summer, at the end of which time the top of the case is broken open by the inmate and the fly pushes its way out, rapidly unfolds its rolled up wings and is soon busily engaged in carrying on its lifework.

An average of 685 maggots per pound of manure has been observed, which means close to half a million flies per wagon load, or 1,000 pounds of manure. Now remember how hard it is oftentimes to swat one fly and think of the task you would have to swat a million, and then make up your mind to swat the manure pile. Fly control means manure and filth control, not by destroying the manure, for this is badly needed as fertilizer on our farms, but control it by not allowing it to accumulate in heaps out in the stable yard or corral. The old system of throwing manure in a heap just outside the barn is the most wasteful of all methods of handling manure, resulting in the loss of one-fourth to one-half of the fertilizing value from leaching and fermentation. The best practice is believed to be to apply the manure to the land as rapidly as it is made. Thus it will be seen that our recommendation regarding the management of manure in fly control is in harmony with good agricultural practice as well.

By hauling the manure away from the stable daily, or at least every other day (preferably placing it directly on a manure spreader at the barn door) and hauling it to the field to be spread will result in a wonderful reduction of flies. In towns and villages it is generally necessary to store the manure temporarily in a bin which is built in the shape of a small lean-to-, with a small door or window opening into the stable to allow the manure to be placed in the bin without walking outside and opening a lid, which operation permits flies to enter the bin and propagate. The usual manure bins with lids opening outside to receive the manure ordinarily become fly breeding receptacles instead.

Insecticides and disinfectants for the manure pile are not recommended because these require daily expenditure of time, labor and money with none too good results, and the fertilizing value is almost invariably impaired as well, and the chickens and pigs may be exposed to dangerous poisons.

Finally, if a privy exists on the premises, with contents exposed to flies, don't lose a moment's time in applying a quantity of crude oil or creosote oil to the contents, which treatment will not only repel flies but kill maggots as well. Repeat this treatment at least twice a week. Then don't allow hog slops to stand around in barrels, etc., for you will find these soon to be alive with maggots. Also don't allow the waste wet mash, silage, spent hops, etc., to accumulate about the pig pens, cowbarns and chicken houses. Always remember that flies will not breed in any sort of dry matter.

The winter and early spring is a good time to begin your crusade against flies. In the winter time, particularly in California, if you dig open an old manure pile you will frequently find full grown or nearly full grown maggots in a comparatively inactive condition. These will develop rapidly at the approach of warm weather, and even during the warm spells of the winter this happens. Therefore it stands to reason that a thorough cleaning up of the barnyard during the winter and removal of all the manure to the fields, where it is spread thin, thus exposing the maggots to the cold and rain, will put them out of business for good. Then having gotten things clean, keep them clean. Flies don't breed in clean places. You will

General Endorsement of Spraying Proves Fallacy of Propaganda

Representative growers of Southern California—well known and successful—have at many recent meetings of clubs and associations made a general endorsement of Victory Tree Spray. In instance after instance Victory Tree Spray has been used by these men with entire satisfaction and with results that give the laugh to the propaganda now current against spraying.

Packing House figures may well be taken as authority on the results from arsenical spraying. Here are the figures from one of the largest and most successful packing houses in Southern California, proving beyond doubt the value of spraying in producing clean fruit:

Of clean fruit received, 10 groves were sprayed; 6 fumigated; 2 sprayed and fumigated; 1 fumigated twice.

Of commercially clean fruit, 12 groves were sprayed; 20 fumigated; 8 sprayed and fumigated; 6 fumigated twice.

Of the dirty fruit, 8 groves were fumigated; 2 sprayed.

Spraying Produces Earlier Fruit

This same packing house manager makes the statement that he opened his plant on November 26 and continued until January 1 on sprayed fruit only, which shows that spraying advances the test date from a month to six weeks. This advance also means escaping the frost danger and having ripe fruit for an early market.

Those groves treated with Victory Tree Spray have no red spider. In fact, there has been no epidemic of this pest since spraying began.

The effect of spraying on citricola is already showing up with fine results. Many other beneficial effects of spraying also are to be seen.

Keep Your Livestock and Poultry Healthy
CRESY-LOL—The Standardized Disinfectant
Kills Lice, Mites, Fleas. For Scratches, Wounds, Scab, Ordinary Mange, Etc.
Mfg. by
ARTHUR R MAAS, CHEMIST
308 E. 8th Street Los Angeles, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

find the most flies where there is the most filth.

There are many kinds of fly poisons in use, notably the proprietary cobalt and arsenical solutions. There is considerable danger in the use of many of these, as numerous newspaper accounts reporting deaths of children traceable to drinking fly poisons will testify. A very good substitute for such poisons is to be found in formaldehyde (formalin). This chemical may be purchased commercially in a 38 to 40 per cent solution and must be greatly diluted for use as a fly poison. The commercial 38 to 40 per cent soltuion is poisonous like wood alcohol if taken internally, hence must be treated accordingly. However, when diluted to a strength of 1½ or 2 per cent ready for use it is comparatively safe. For household use two or three teaspoons of the concentrated (38 to 40 per cent) formaldehyde is used to a pint of a mixture of water and milk in about equal proportions (canned milk is excellent and much less is necessary), with a small quantity of sugar or molasses added to sweeten. On a larger scale the quantities are as follows: formaldehyde 1 pint, canned milk 1 pint, sugar 1 pound, water 3 gallons.

The preparation is used as follows: Place a small piece of bread (or even a small sponge) in a shallow vessel, such as a saucer or tin plate, and pour over it enough of the mixture to saturate the bread, and leave some of the liquid about in the plate. Then place the receptacle where there are most flies. Flies which drink the solution are killed in the course of a few minutes and will be found scattered about near by. The liquid must be replenished frequently.

Sodium salicylate at the rate of 3 teaspoons of the pure chemical (a powder) to a pint of water, may be used in the same manner as the formaldehyde solution with similarly good results.

Relieve the Livestock of Torment

MANY pounds of flesh and of butter fat are lost to livestock men because of the insect pests which torment and even injure. A measure of relief may be had from the fly pest by liberal use of commercial repellents and antiseptic remedies. To those unable to secure the proprietary article and who wish opportunity for making at home, here is a formula commonly used.

Arsenical Dips

The formula commonly used in making an arsenical dip is as follows:

Sodium carbonate (sal soda)	24 pounds
Arsenic trioxid (white arsenic)	8 pounds
Pine tar	1 gallon
Water sufficient to make	500 gallons.

Put 25 gallons of water into a kettle or tank of 40 to 50 gallons capacity, heat to boiling, and add the sal soda. When this has dissolved add the white arsenic, then boil and stir for 15 minutes or longer, until the white arsenic has entirely disappeared. Cool to 140 degrees Fahrenheit (by the addition of cold water if desired), then pour in the pine tar in a thin stream while constantly and vigorously stirring the solution. Immediately empty the liquid into the dipping vat, which has already been three-fourths filled with water, and stir thoroughly.

A by-product of the action of sodium carbonate on white arsenic is the gas carbon dioxid. The escape of this gas is attended with considerable foaming of the solution, so the kettle must be generously large, and the operation of boiling must have constant watching to prevent the liquid from frothing over the edge of the kettle.

The kettle or tank, utensils, and materials must be perfectly free from all greasy or oily substances, as a small quantity of such matter is sufficient to form a coating over the arsenic, and thus to prevent or delay its solution.

If very hard water is used there may be some residue of gray or whitish powder left undissolved. In such case it is not arsenic and the solution may be perfect.

Nicotine Dip

Successful animal dips of nicotine usually contain not less than five one-hundredths of one per cent pure nicotine, and two per cent flowers of sulphur:

Forty per cent nicotine sulphate	1 pound
Flowers of sulphur	16 pounds
Water	96 gallons

Mix nicotine solution and sulphur thoroughly, then add water. Do not heat above 105 or 110 degrees.

Fly Repellent

Common laundry soap	1 pound
Water	4 gallons
Crude petroleum	1 gallon
Powdered napthalin	4 ounces

Cut the soap into thin shavings and dissolve in water by the aid of heat; dissolve the napthalin in the crude oil, mix the two solutions, put them into an old dasher churn, and mix thoroughly for 15 minutes. The mixture should be applied once or twice a week with a brush. It must be stirred well before being used.

Warbles or Grubs in Back

Grubs weaken cattle, cause loss of flesh and reduce quantity of milk. This pest causes a loss of $50,000,000 annually to this country. The attacks of the fly which causes the warble may be lessened by the above fly repellent. The warble already established in the back should be removed by slightly increasing the opening with sharp knife and pressing out the grub. Be sure it is destroyed in order to prevent the maturing of another fly. Small oil can with kerosene may be used to force a drop of oil through the opening which kills the grub. This is not as satisfactory as the other treatment. If a neighborhood will combine entire eradication is possible.

Livestock remedies and pest eradicators and, in fact, general sanitation appliances, are now offered by chemical and other manufacturers, and these often afford more ready relief for the busy livestock man where they can be secured.

Mites and Scabs

Mites cause untold loss and yet are easy of control with the ordinary animal dips. Commercial mixtures are good or one may prepare the old time sulphur dip very similar to the formula given in 10. Use for an animal dip at a strength which contains around one-fourth of one pound of sulphur to the gallon. Be sure to use only clear liquid, allowing no sediment in the dip. Have temperature of bath around 100 to 105 degrees.

Lice

During the winter it is not wise to use dips for lice on calves, and the ordinary sodium flouride formula prescribed for lice on chickens will be found excellent. There are a number of powders on the market made with this base or it may be prepared at home in proportion by volume of 2/3 sodium flouride and 1/3 kaolin or common road dust.

Stable Flies

It is advisable to begin early in the year to fight flies. They increase with such tremendous rapidity that no time should be wasted after they begin to appear. Formaldehyde in small quantities in sweet milk makes a very effective killer when set around in shallows pans. A solution of 1 pound of oil of mirbain in 25 gallons of kerosene with one gallon of cheap cylinder oil added, sprayed on the flies in the cool of the morning when they are dull, will kill them quicker than anything. This formula is successfully used in many big dairies. Manure piles should be given early attention, as 900,000 larvae per ton have been

found after four days standing. The manure pile should be screened or treated as recommended by Dr. Herms in this issue.

THE HOLSTEIN SHOW AT SACRAMENTO

(Holstein awards in last issue.)

Disappointing in numbers but satisfactory in quality was the showing made by the California Holstein breeders at the recent state fair. The Holstein business in this state has been expanding so rapidly during the last few years and the older herds have been called on so often to furnish foundation stock to men entering the business that many of the familiar exhibitors were unable to show this fall. For the most part, however, their places were taken by breeders making their first appearance at the state fair.

Undoubtedly the outstanding feature of the show was the splendid exhibit by the George Junior Republic of Chino, which drew down the lion's share of the awards made by Professor H. H. Kildee of Ames, Iowa.

The three aged bulls had an easy top in Dichter Spofford Korndyke Lad 5th, grand champion at Los Angeles last year. This bull is of rare show type, full of flesh and quality, true in his lines and of correct dairy pattern. He found little difficulty in going through the grand championship. The two bulls below him fell into their places quite naturally.

The two year olds were led by last year's junior champion, Prince Bonnie Walker. This fellow has improved considerably during the last year and is really quite a show bull. His more desirable type placed him above the Sierra Vista entry, a bull of great size for age but that was packing more beef than is desired in a dairy sire.

Ball had the pick of the four senior yearlings that did not make a particularly strong class.

The George Junior herd furnished the winner among the junior yearlings with a son of the champion. Higdon was second with a good son of King Korndyke Pontiac 20th over three other calves that were but fair.

The Chino school landed another blue with the senior bull calf, also a son of their winning aged bull. Holmes was second and Dolcini was third over a nice calf from the Sierra Vista herd

E. F. Gleason, making his first appearance at Sacramento, was an easy winner among the juniors with a very attractive youngster that was so well liked by the judge that he was later made junior champion.

Holmes returned last year's champion cow to the same honors this year. Ida Lotta Winifred Burke is a real cow from her muzzle to her mammary system. Straight of back and rump, and with plenty of constitution, she needs but a wee bit better balanced fore udder.

The three year olds afforded another win for George Junior, which also took like rating in the two year olds.

Ball had little trouble among the senior yearlings. Higdon was second and also third with a daughter of the grand champion cow. Last year's junior champion showing in this class was out of the money.

The next two classes went to the Republic's herd and netted it seven blues in the single classes. Holmes won the baby class.

The Republic boys were kept busy taking care of their blues in the groups, winning the aged herd, young herd, get of sire and produce of dam. Dolcini had the winning calf herd.

HOLSTEIN BREEDERS MEET

The annual meeting of California Holstein-Friesian Association was held at Sacramento on the evening of September 5. Directors for the coming year were elected as follows: Fred Hartsook, Lankershim; R. A. Condee, Chino; G. M. Brown, Los Angeles; Wm. R. Harriman, Hondo; W. J. Higdon, Tulare; Frank M. Helm, Fresno; A. R. Magruder, Ripon; Fred W. Kiesel, Sacramento; J. M. Henderson, Jr., Sacramento; Frank L. Morris, Woodland; H. V. Bridgford, Patterson; De Lancey Lewis, San Jose; Owen Duffy, Napa; E. Swift Train, San Francisco; E. N. Brown, Palo Alto. Frank L. Morris was re-elected president and C. L. Hughes was re-elected secretary-treasurer. Fred Hartsook and W. J. Higdon were elected first vice-president and second vice-president respectively.

The annual report of the secretary-treasurer established some facts that had not before been realized by most California breeders, among them that during the first six months of 1921 only three states sold over $400,000 worth of registered Holsteins each at public auction, New York, Wisconsin and California, and that considering this volume of business the relative number of breeders in each state should be considered, for according to the 1920 census of the Holstein-Friesian Association of America, New York had 5,700 breeders, Wisconsin over 3,800, while California had only 333 breeders; that the average of $387 per head on 1,049 head the first six months of this year in California was the highest of any state regardless of the number of cattle sold; that out of the five only sales that averaged over $800 per head, California had two; that our association now has 130 active members, a proportion of breeders that compares favorably with other states; that the average selling commission paid to California Breeders Sales and Pedigree Company this spring was nine and eight one-hundredths per cent, a selling cost that has considerable advantage over other localities where selling operations are less centralized. The association treasury is in a healthy condition with over $5,700 cash on hand, all of which and more will be necessary in financing the Delhi settlers in their foundation purchases of registered Holsteins. Eleven new members were admitted at the first meeting of the new directors, bringing the total membership up to 141.

RIGHT FOR HIM

Shy—Gee, I'd hate to be up so high in the air with that aeroplane!

Sly—Well, I'd hate to be up so high without it.—Drexerd.

A friend that you have to buy won't be worth what you pay for him, no matter what that may be.—G. D. Prentice.

VENTURA COUNTY FAIR

The Ventura County fair is but ten days away and there is every indication that opening day will find the greatest array of livestock ever assembled in Ventura County. The fair opens October 5 and continues for the balance of the week.

The Sierra Vista Stock Ranch at Perris is sending ten pens of hogs and three stalls of fine Holstein cattle. Loring Farnam of Ojai will make a great display of dairy cattle. Mrs. Beatrice Gantz of Solvang will exhibit a dozen fancy Toggenberg goats and three fancy horses for the gaited department.

J. B. Lapeyre of Moorpark has entered his beautiful Percheron stallion, "Buster," and D. J. Bastanchury of La Habra has a number of fine hogs on the way for the opening. J. P. Gray, first assistant chairman of the livestock department, has announced that there will be almost more entries than the organization can are for.

Gwyn Thurmond, chairman of the agricultural department, and Mrs. Thurmond, chairman of the woman's department, both report their departments full. Matt S. Cohen of Phoenix has been selected as judge of the horse show. The races will be under direction of Ed R. Smith, who has been in charge of the race program at Sacramento.

Maud Banks of Covina will enter her famous horse, "Confidence," in the horse show. She has also arranged to put up a silver cup for the horse show. Three thousand dollars is to be awarded in prizes in the horse show. Among the famous horses to be seen will be F. W. Mathieson's famous string, including Sinbad, The Vamp and Liberty Bond. C. K. Billings will exhibit the world famous trotter "Uhlan," who will also be put through some fancy steps.

BEET PULP FOR LAMBS

At the Nebraska experiment station it was demonstrated that a ration of alfalfa hay, dried hay, beet pulp, cottonseed cake and silage produced the largest gain and returned the most profit on a lot of 31 lambs in a 100 day feeding experiment with 12 different rations, recently completed.

The following points are outstanding from the detailed results given: Dried beet pulp when properly supplemented with alfalfa hay and cottonseed cake is an excellent feed for fattening lambs. Cottonseed cake added to the ration at the rate of one-third pound per lamb daily in every case increased the daily gain and the net profits.

Silage added to the ration of hay, dried pulp and cottonseed cake increased the daily gains, lowered the cost of gains and increased the net profit per lamb. Beet tops added to hay and maize ration produced gains at a lower cost, and increased net profits. Beet tops added to hay, dried pulp and cottonseed cake ration increased the daily gain slightly, increased the cost of gain and decreased the net profit.

BUT HE'S ON HIS WAY

Uncle Tom arrived at the station with the goat he was to ship north, but the freight agent was having difficulty in billing him.

"What's this goat's destination, Uncle," he asked.

"Suh?"

"I say, what's his destination? Where's he going?"

Uncle Tom searched carefully for the tag. A bit of frayed cord was all that remained.

"Dat ornery goat!" he exploded wrathfully. "Yo' know, suh, dat iggorant goat done completely et up his destination.—American Legion Weekly.

172 Registered Holsteins
AT PUBLIC AUCTION

Tuesday
OCTOBER 4
70 REGISTERED HOLSTEINS
Complete Dispersal
S. O. Walker Herd
Visalia, Cal.

KING OF THE BLACK AND WHITES will be sold. He was the first bull whose seven nearest dams averaged over 30 lbs. butter in seven days.

35 DAUGHTERS OF KING OF THE BLACK AND WHITES, some out of dams with over 30 lbs. butter in seven days.

MANY A. R. O. COWS with records up to over 26 lbs. butter in seven days.

YOUNG BULLS of choice breeding, including two grandsons of Sir Pietertje Ormsby Mercedes.

Every animal guaranteed a breeder; no tuberculin test certificates.

PLACE OF SALE: S. O. Walker Ranch, 3½ miles east of Visalia on Mineral King Avenue.

Wednesday
OCTOBER 5
47 REGISTERED HOLSTEINS
From the Herd of
Robt. T. Curtis & Son
Exeter, Cal.
Selling at Tulare Sale Pavilion
Tulare, Cal.

Including:

COLOMA BEAUTY BUTTER MAID, 34.72 lbs. butter in 7 days as a junior 4 year old.

THREE DAUGHTERS OF KING KORNDYKE PONTIAC 20TH, the $12,000.00 son of Miss Valley Mead De Kol Walker.

13 GRANDDAUGHTERS OF KING DOLLAR, the 38 lb. son of Spring Farm Pontiac Cornucopia.

GRANDDAUGHTERS of Pontiac Korndyke, Pontiac Aaggie Korndyke, King of the Pontiacs, and other famous sires.

A SON OF KING KORNDYKE PONTIAC 20TH, with an average of 808.27 lbs. butter in one year for six of his 7 nearest dams.

Guaranteed breeders; tuberculin tested and subject to retest.

Thursday

Cooperative Hog Selling

IT is to the best interests of the hog raising industry in California, or anywhere else, for the farmers to produce the grade of stock desired by the packers. This should be the aim of the hog raiser—to feed, grade up and finish his animals to meet the buyer's best expectations. If a farmer is to raise hogs at all for commercial disposal, he should raise such hogs as will be welcomed on the market with top prices. Pure breds or high bred grades usually stand the best chance of making the first class," writes D. H. Bittner, general manager of the California Farm Bureau Marketing Association, in a recent bulletin published by the Kern County Union High School. "This grade of animal is what is known to the hog seller and buyer as 'top stuff.' The question of breed, or variety of the stock, does not enter into the grading which differentiates 'top stuff' from 'bottom stuff.' Regardless of breed, the hog that is thoroughly fattened, hard and finished, will usually bring the best price on the market.

"Just at present we have a hog market which has varied from the usual standards. Now the market is demanding a fresh meat hog, one which will cut high quantities of lean meat and furnish very little fat. This is due to the fact that cottonseed oil and other fat substitutes have forced the price of lard down and down. At present the packer wants to avoid the accumulation of any more lard, and so bids highest for the 160 to 170 pound hog, which is in good firm growing condition, but does not show excess fat. Lard quotations for May delivery are only nine cents, so the packer can't afford to bid for the fat, well finished hog now, under this new abnormal condition in the hog market.

"At hog auctions, such as have been held regularly in the San Joaquin Valley during the past two years, under auspices of the California Farm Bureau Marketing Association, in which the hogs are officially graded into consignments according to their quality, there is often a difference of between two and three cents per pound between the top price secured and the bottom price.

"The difference in price means a difference in the grade of the stock. The top price is secured for hard, grain fed, thrifty animals. These can be produced from young pigs in six or seven months, especially in California. The packer wants hogs that will weigh in at the packing house alive at from 150 to 190 pounds. Such hogs must weigh 160 to 200 pounds at country shipping points, at distances such as separate the local shipping towns of the San Joaquin Valley from the Los Angeles and San Francisco markets. The younger a hog is when finished for market, the more valuable he is.

"It is well to remember, too, that a hog will acquire more good, hard fat through taking nourishment from a self feeder than it will if fed by hand, when its gluttonous tendencies result in serious overtaxation of its inner capacity for feed. Self feeders make good hogs.

"Cold statistics prove beyond the possibility of a doubt that the California Farm Bureau Marketing Association, which operates on the cooperative, non-profiting plan for the benefit of hog producers, has accomplished much for the swine industry of this state, particularly in the San Joaquin Valley, where the live hog auctions are held according to regular, prearranged schedules.

"This association, which was established November 1, 1918, without one cent of capital, has handled, since its incipiency, $3,500,000 worth of hogs. A conservative estimate of the number of consignors who have marketed their stock through the association, many of whom, of course, have repeated, being regular consignors, place this figure at 8,000, and these 8,000 consignors, during the past two and one-half years, have received a $300,000 aggregate more for the hogs which they sold than they would have without the aid of the farm bureau marketing organization.

"Another argument in favor of cooperative marketing of hogs which is found in the statistical column is the fact that the top prices received at the hog auctions, held at local shipping points in the valley, have averaged consistently higher than the top prices offered at Chicago. The Eastern hog raiser has to ship his stock to Chicago and stand the shrinkage which always occurs en route. Our local men have been hauling their hogs a few miles in a wagon or truck to the local hog auction sale, and there receiving a price equal to and lately very often a cent higher, than the Eastern man received on the same day after he had delivered his hogs to Chicago. This means that the San Joaquin Valley farmer has actually been receiving from a cent to two cents more for his fat hogs than the Eastern man.

"Beneficial features are distributed about evenly between the producer and the packer by the California Farm Bureau Marketing Association. The small hog raiser, who, without the assistance of a cooperative organization is practically at the mercy of the speculative buyer and is subject to the inconvenience and losses occasioned by shipping his animals to market, is enabled to receive through the association hog sales as good a return for his stock as is the larger producer. He merely has to bring his hogs to the local sale point, where they are graded and placed in consignments in accordance with their quality and size. The next day he receives a check for his hogs by mail. This check was mailed him the afternoon of the sale day. If he only had a few hogs to sell, or even one, the price on his stock will be as high, according to the grade of the animals, as if he were selling a carload of hogs. There have been many bringing just one or two hogs at a time to sell at the association auctions.

"Through these hog auctions the packers are afforded a dependable source of supply whenever they want hogs in large quantities, as the sale managers grade the stock in carload lots, according to size and quality. All Pacific Coast packers have acknowledged that the hogs which they are now receiving through the association are 100 per cent better than the stock they received when the organization was first placed in operation. This, indeed, is a noteworthy achievement in the interests of the hog raising industry.

"The only requirement made of farmers who sell their hogs through the association is that they be paid up members of the farm bureau of the county in which they reside. The marketing organization was accomplished through establishment of a board of directors composed of representatives from every county farm bureau in the San Joaquin Valley. These men in turn created the various subcommittees in each county, etc. The farm bureau movement is responsible for the marketing association and hence it is only fair that every man who sells hogs through the Marketing Association be a member of his local county farm bureau."

The board of supervisors of Merced County has announced that it will allow appropriations for farm adviser, assistant farm adviser and home demonstration agent.

Manager Norton of the Stanislaus County farm bureau has an order from Nevada for two carloads of dairy cattle and calves to be shipped at once.

Shorthorn Opportunities on California Ranches

By J. I. Thompson, Manager Straloch Farm

CAN Shorthorn cattle be produced profitably on high priced land? Land has sold for such high prices per acre in California and in many other states the past three years that many people are wondering whether or not it is possible to produce beef cattle at a profit.

Of course, a number of factors enter into consideration—the character and location of the land, the yield per acre, the character of the cattle and, of course, the individuals back of the enterprise.

The following conditions might be taken as average ones for the central part of the Sacramento Valley.

Assume that the land is valued at $300 per acre and the cattle at the same value per head. One acre of non-irrigated pasture will carry a cow and her calf from February to July 1. Interest on this one acre at 8 per cent would be $24, and on the investment in the cow, the same amount. During July, August and September the stubble fields may be utilized, which at present rates would add $6 more to the feed bill.

The other four months will require two tons of alfalfa hay and 1200 pounds silage per cow. At present costs this would be $20 for the feed. The silage can readily be produced after a crop of grain hay has been taken off of the land. With irrigated pasture the cost can be materially reduced.

In order to get a calf to marketable age an average of eight months of feed must be allowed after the calf has been weaned. This will require about 1000 pounds barley, 2400 pounds hay, 500 pounds silage and about $6 worth of special concentrates such as oats, bran and oilmeal, a total of $30. Since market price was charged for these feeds interest on the land which produced the feed is not included, for the cattle are considered as the market for the grain and hay.

Perhaps five per cent of the cows on the average will not calve each year, so that per cent is added to the total bill of $104, making it $109.

One dollar per month per cow must be added for labor and the same rate figured for the calf for the last eight months, bringing the cost up to $129. The lowest prices paid for a pure bred bull at the last annual Shorthorn sale at Davis was $140, so that on the basis of these figures not much margin was available. However, the average of the sale was $268, which, less $129 as an average cost, leaves $139 to cover all general items that might be included. The average of all Shorthorn sales in the United States for the last 20 years is $282. Of course, there is not this much margin on the average, for the cattle sold in those sales were far above the average production of this state, but not above the average which it is possible to produce under normal conditions in California.

I believe, however, that range men will pay $200 or more for bulls that suit them, and I do not believe that veterinary fees, bull service, average loss and incidentals will absorb a sufficiently large percentage of the $71 margin, but that a reasonable return on the investment will be secured.

No credit has been allowed for manure returned to the land, which is sadly needed in a large part of this valley and the state, but even without it the margin is far more inviting than that which the grain farmers of this region are receiving at the present time.

The longer the cattle are kept on the land, making possible the application of large quantities of manure with each rotation of crops, the larger and surer are the yields. As production increases the area per cow decreases, so the margin tends to become more favorable each year, and if the animals produced increase in excellence from year to year the business is bound to be profitable.

The range men of this state are rapidly finding out that the calves from pure bred sires will either go to market at a given weight earlier or, if their finishing is done entirely on grass, may not go to market any younger, but will weigh more at the same age when marketed than the get of average grade or scrub sires.

The old bogey that pure breds were not hardy enough for range conditions is gone. True, some bulls which have been heavily fed on grain must be conditioned for the range by a gradual change to hay alone and then grass, but breeders are awake to this condition and are prepared to meet it.

There is abundant room for the foundation of innumerable small herds of pure bred beef cattle in our irrigated valleys, to supply the seed stock for other pure bred herds and for the range, and the dependable Shorthorn cow is better appreciated today than ever before. There are some 117,600 farms in California, but Shorthorns are found on only 243 of them. Surely there is abundant room for expansion.

Bred for generations for general utility, the tendency to produce milk in abundance is as much a part of the breed's characteristic as the familiar red, white and roan color. Ninety per cent of the cows will give all of the milk a calf can handle and this is the basis for the production of the scale and substance demanded by range men.

Where dairying is not advisable or does not appeal to the land owner or renter, the Shorthorn cow is rapidly coming into favor on our higher priced irrigated lands. That this is as it should be is abundantly proven by the fact that not a single failure in this business has been recorded in the past ten years, chargeable to the Shorthorn herd. True, breeders of Shorthorns have failed, but in every case it was other issues that produced the deficit, outside, unrelated issues which cannot be charged against the cows.

MANUFACTURE OF ROQUEFORT CHEESE

Manufacture of Roquefort cheese from cow's milk is described in a recent publication, Bulletin No. 976, of the United States department of agriculture. This may be obtained free on application to United States Department of Agriculture, Washington, D. C.

The main points of the process are:

The Roquefort cheese from France is made of sheep's milk and is one of the oldest cheeses of which there is record. The average composition of good Roquefort cheese is about as follows: Water, 38 percent; fat, 32 per cent; protein, 20 per cent; ash, 6 per cent; salt (NaCl), 4 per cent.

Sheep's and cows' milks differ physically and chemically. The ratio of the fat to the protein is about the same in either case.

Fresh, clean milk is essential. Three or four per cent of a starter is used and the milk brought to an acidity of 20 to 23 before setting.

The milk is warmed to from 83 degrees to 85 degrees F. and set with rennet at the rate of 3 to 4 ounces per 1,000 pounds of milk.

The milk is allowed to set for from 1 to 1½ hours and the curd is then cut into small pieces with a ⅝-inch curd knife.

Ten minutes after cutting, the curd is scooped on to a draining rack and allowed to drain for about 20 minutes.

As the curd is placed in the forms it is sprinkled three or four times with the mold powder.

The cheese is turned three or four times the first day and at least twice a day thereafter until salted. The temperature of the drain room should be from 65 degrees to 68 degrees F., with a relative humidity of 85 degrees to 90 degrees.

The cheeses in the drain room are washed every day for four or five days, after which they are salted in a special room in which a temperature of 48 degrees F. and a relative humidity of between 80 degrees and 90 degrees are maintained. The salting process requires a week or 10 days. A special conditioning apparatus is necessary to maintain the proper temperature, humidity and ventilation. The cheeses are then pierced 30 or 40 times and placed on the shelves, where they rest on their edges instead of their flat sides as previously.

By means of refrigeration and a special conditioning apparatus the cheeses are ripened at a temperature of from 45 degrees to 50 degrees F. with very little ventilation. During the salting period and while the cheeses are wrapped in foil the air should be cold and dry.

The cheeses are ripened for two or three months; during this period they are scraped every three or four weeks, with an aggregate loss of from 7 to 8 per cent. After ripening, the cheeses are enveloped in foil and held for at least one or two additional months.

At Grove City, Pennsylvania, the estimated cost of making one pound of cows' milk Roquefort was $0.46.

With 4 per cent milk the yield of cheese should be 10 or 11 pounds per 100 pounds of milk.

When cured the cheeses are wrapped in parchment lined tin foil, packed in excelsior, and shipped 12 in a box.

With proper curing conditions and experienced help cows' milk Roquefort may be manufactured successfully.

J. H. Cazier & Sons
Wells, Nevada
A government accredited herd. No reactor in 16 years. A herd whose record in the show and sale ring is only surpassed by the esteem accorded its productions by cattlemen. We can furnish bulls or females to fill any need—and at sound prices. Visit our herd or write for information.

DR. HESS Instant Louse Killer Kills Lice

For Use On Your Poultry

Seize the hen and dust Instant Louse Killer into the feathers. The handy sifting top can makes it convenient to use. Sprinkle it in the nests, on the roosts and floors. Put Instant Louse Killer in the dust bath occasionally—your hens will do the rest. This means louse prevention.

FOR STOCK

With one hand stroke the hair the wrong way, with the other sift in the Louse Killer. Especially good for lousy colts.

GUARANTEED. The dealer will refund your money if it does not do as claimed.

1lb. 30c, 2½lbs. 60c *(except in Canada)*

LIVESTOCK SALE CALENDAR

Holsteins

October 4, S. O. Walker, Visalia.
October 5, Robt. T. Curtis and Son, Tulare.
October 6, Alex Whaley, Tulare.
October 12, John Saxer, Modesto.
October 21, Robt. N. Clapp, Nuevo.
November 3, A. W. Morris & Sons, Inc., Woodland.
November 9, Palo Alto Stock Farm, Palo Alto.

Herefords

October 19, W. J. Bemmerly, Woodland.
October 27, Pacific Coast Hereford Breeders' Association, California National Livestock Show, San Francisco.
November 1, J. H. Cazier and Sons, Sacramento.

Shorthorns

October 28, California Shorthorn Breeders' Association, California National Livestock Show, San Francisco.

Guernseys

October 20, Walter H. Dupee, Rhoades & Rhoades Sales Pavilion, Hynes.

Just before the Hereford show at Sacramento, the Nevada Hereford ranch, Wells, Nevada, J. H. Cazier & Sons, owners, sold to the Dangberg Estate, Minden, Nevada, the junior yearling bull, Blanchard 1st, that was junior and grand champion of the show. The youngster is one of the outstanding sons of the popular bull, Beau Blanchard 76th, that was grand champion at Sacramento and Los Angeles last year. Blanchard 1st was junior champion at Los Angeles last year and was grand champion at Ogden. The price is understood to have been considerably above $2000.

W. M. Carruthers of Live Oak, who had scheduled a sale of Shorthorns to be held at Sacramento, November 2, has decided to call the proposed sale off owing to sale at private treaty of ten choice females to L. N. Pabst of Cedarville. Carruthers states there is a greater demand for breeding stock than at any time during the past several years.

The Holstein-Friesian Association of America has announced that the cow, Queen De Kol Bonheur Pontiac, has completed a yearly record of 1,016.47 pounds fat from 31,144.4 pounds milk, thus making her the 39th cow of the breed to produce more than 1000 pounds of fat in 365 days.

William Briggs, Hereford breeder of Dixon, has recently increased his herd through the purchase of 21 heifers from a prominent Missouri herd. Nineteen of the heifers were sired by the well known bull, Masterpiece, and two are by the $24,000 bull, Kenilworth, formerly Repeaters 7th's Model.

During the recent state fair E. A. Noyes & Son, Sutter City, sold the two year old Hereford bull, Bar N King, to I. L. Borden of San Francisco for $1000. Bar N King was bred and shown by Messrs. Noyes.

Bullard Brothers, Woodland, now own the famous Rambouillet ram, Monarch, having purchased him at the last Salt Lake sale for $3000. This ram is declared by leading authorities to reprensent the best type of Rambouillet yet produced in America. Sons of his head many of leading flocks of the West and are in great demand. It is expected that Monarch will make a great record when mated to the high class ewes owned by Messrs. Bullard.

The animal husbandry division of the university farm has received a shipment of feeder steers from the university range herd to be used in feeding trials. These steers represent typical native mountain cattle, and the figures obtained from them will be checked against cattle of similar age that will have the benefit of a cross of pure bred Shorthorn blood.

At the annual meeting of the California Jersey Cattle Breeders' Association, held during the state fair, Judge Peter J. Shields of Sacramento we re-elected president. Guy H. Miller of Modesto was named vice-president and V. C. Bryant of the University of California was again appointed secretary. N. H. Locke of Lockeford is treasurer. The directors are: J. H. Sawyer, Galt; Arthur Purvine, Petaluma, and Dr. H. G. Gross of Eureka.

The Poland China breeders met in annual session at the state fair and elected J. I. Thompson, manager of Straloch Farm, Davis, president; Alfred Buckland, Fresno, vice-president; and H. K. Dickson, Bakersfield, secretary-treasurer. A. J. Elliott, Tulare, was named sales manager.

The California Duroc-Jersey Breeders' Association elected V. F. Dolcini of Davis to the presidency of that organization and J. E. Thorp of Lockeford to the secretary-treasurership. The two vice-presidents are C. N. Slocum of Willows and W. P. Hodge, Hinckley; H. C. Witherow, Live Oak; W. M. Way, Modesto; W. V. Mong, Whittier, V. C. Craig, Owensmouth, and Dr. Sorrenson of Stockton are directors.

The McCloud River Lumber Company, McCloud, has a wonderful yearly record in process of making. This great cow has made over 37 pounds butter in seven days and was continued on strictly official test and for more than 100 days has milked right around 100 pounds per day and is testing close up to four per cent on the average.

FIGHTING CHOLERA WITH PRECAUTION

When hog cholera sweeps through a neighborhood, causing the death of hundreds of animals, a simple precaution, as the proper location of the hog lot, may be the means of preventing infection. Where not to have the hog lot is pointed out and other suggestions on the control and eradication of this disease are given in a leaflet published by the United States department of agriculture. Hog lots should be located away from streams and highways. Free range, streams, irrigation canals, etc., help in the spread of cholera outbreaks. Don't visit neighbors' hog lots or allow neighbors to visit yours if they have sick hogs. Infection may be carried by teams and wagons from highways; don't drive into hog lots. Isolate for at least two weeks all new stock hogs and those just returned from exhibitions and sales. Don't borrow or lend hogs for breeding purposes if cholera is in the community.

Burn to ashes or bury four feet deep all animals that die on the farm and the internal organs of slaughtered animals, since they attract dogs which may carry infection. If cholera appears in the neighborhood, confine your dog and encourage others to do likewise. Immunize herds located dangerously near infected centers. Careful attention to the feeding and handling of the herd after immunization is an important matter. Mange, lice, and worms lower the vitality of hogs and render them more susceptible to disease.

If cholera appears in the herd, post warning notices so your neighbors will know about it. Have all susceptible hogs immunized at once by some one with special training and experience, preferably a competent veterinarian. Insist that the temperature of all hogs be taken at time of treatment and an increased dose of serum given to those showing a temperature of 104 degrees Fahrenheit or over. Confine all treated hogs to limited, clean quarters; keep on light, restricted diet for at least two weeks, and give plenty of pure drinking water. Anti-hog cholera serum is not a cure, but when used as soon as cholera appears in a herd it seems to have a favorable effect on some animals in the very early stage of the disease. Don't rely on serum to cure sick hogs—it is primarily a preventive.

If the disease comes to your farm and runs its course, disinfect thoroughly afterwards all places where sick hogs have been. First, remove all infected manure and spread on fields inaccessible to hogs. Burn all litter, rubbish and old troughs from infected pens and lots. Turn over portable hog houses, exposing the interior to sunlight. Thoroughly clean pens and buildings in which sick hogs have been kept and disinfect by spraying with compound cresol solution, one part to 30 of soft water. In summer pastures and lots are usually made safe within three weeks by the action of sunlight. Fill, drain, or fence off mud wallows. Disinfect and board up all runs underneath buildings. Destroy hogs that don't fully recover; they may carry cholera infection.

EXPERIMENTS WITH FEED

Hydrolized sawdust as a part of a ration for cows is apparently giving satisfactory results in Wisconsin. The forest service of the United States department of agriculture reports that cows at the agricultural college of that state are doing as well on a ration consisting of one-third sawdust as they did when their feed was only one-fourth wood meal. That is to say, they are keeping up their weight and their milk production and show no ill effects from the diet.

The bureau of animal industry is considering the proposal of the forest service laboratory to start feeding trials with dairy animals in which the wood product will form a part of the ration and the tests will extend for an entire year at least. The hydrolized wood feed for these cows will be made at the laboratory. So far all the stock feed has been made from white pine sawdust. Other soft woods, particularly the western species, will be tried in the future.

For the Prevention of

ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.

For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS
(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum
(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

Write for free booklet on the Prevention of Anthrax.

Market Cream, Pasteurized

1, Watsonville Creamery & Milk Depot, Watsonville, 96.4. 2, Crescent Creamery, Los Angeles. 91.9. 3, Marin County Milk Company, San Rafael, 86.8.

Goat Milk, Raw

1, R. Godwin, Los Angeles, 96.5. 2, Goat 'Airy (A. Winnan), Los Angeles, 95.5. 3, Richards & Wagner, Montara, 94.1.

Certified Milk

1, Adohr Stock Farm, Van Nuys, 99.4. 2, Cold Springs Dairy Farm, Pasadena, 98.5. 3, Timm's Certified Dairy, Dixon, 96.4.

Guaranteed Milk

1, Brant Rancho, Owensmouth, 97.4. 2, Home Dairy, Palo Alto, 97.3. 3, Stanford Dairy, Palo Alto, 89.5.

Guaranteed Cream

1, Brant Rancho, Owensmouth, 95.9. 2, Home Dairy, Palo Alto, 91.2.

Grade A Milk, Raw

1. J. Henry. Los Angeles, 98.6. 2, Warren Huffman, Palo Alto, 98.6. 3, V. Canzoneri, Los Angeles, 98.0.

Grade A Cream, Raw

1. Sunset Dairy, Palo Alto, 95.4.

Milk Dealers

1. United Milk Company, San Francisco, 88.9.

Dairy Inspectors

1, J. P. Bushong, City Veterinarian, Los Angeles, 98.5. 2, D. M. McNair, San Jose, 97.0.

Best and Most Attractive Display

1, Model Creamery, Redlands, 97.7. 2, Huffman Dairy, Palo Alto, 97.3.

The dairy products exhibit at the California state fair was a marked success. There were 80 entries of milk and cream from the dairymen and milk distributors of the state, 31 entries of butter and 21 entries of cheese. Four dairy products displays were also entered, which filled the refrigerators in the Dairy Building at the state fair grounds and made a very good showing for the industry.

Students Judging

A new feature was the students' contest in judging dairy products. Thirty-three students of the University Farm entered the judging work and the following men won the prizes offered by the state agricultural society (possible score 3,000): 1, J. H. Woodward, 2,848. 2, A. R. Wiley, 2,835. 3, L. H. Nielson, 2,834. M. J. Brunk, 2,827; B. F. Walker, 2,819; L. E. Schultz, 2,809; D. W. Price, 2,806; J. J. McNamara, 2,800; C. P. Meyers, 2,795; C. C. Goodale, 2,794; D. O. Lamb, 2,783; F. O. Ballou, 2,778.

Book Review

MODERN MILK GOATS

"Modern Milk Goats," by Irmagarde Richards, published by the J. B. Lippincott Co., Philadelphia, at $3.00.

This is the most complete book yet published upon the milk goat industry. There are 17 chapters and an appendix, making it a book of 272 pages. It touches upon "native" and imported goats, popularity, the industry today, home dairy, commercial herds, market for products, breeding as a vocation for women, choice of breed, feeding, records, care and health, housing and equipment. There are 76 halftone illustrations. The publishers say:

"The industry is growing rapidly because goats of the beautiful milking breeds are clean and economical, their milk is free from the germ of tuberculosis, more closely approaches human milk than any other, and saves the lives of many children. One good goat gives enough milk (three to six quarts a day) for a family of ordinary size and, furthermore, the flavor is like that of cows' milk and the meat of spare kids is just as good as lamb. The author has had many years of successful experience and covers authoritatively all problems, from selecting your first doe to managing and marketing the products of a modern commercial herd. Careful directions cover the care of the individual family goat. In the words of Professor Edwin C. Voorhies, college of agriculture, University of California, 'Miss Richards' book is the most splendid contribution to the literature which we have on the milk goat industry. I have never read portions of any work which were quite as clear and explicit as some of the chapters of this publication.'"

Miss Richards says in her preface: "The much ridiculed goat of our back alleys is rapidly disappearing, and in her place has come to stay the trim, well bred milk goat of Swiss and English origin, an attractive animal in appearance and highly efficient as a milk producer. She has entered the field of American stock breeding in response to several different and definite needs of modern American life."

PURE BRED IS BEST ON LOW MARKET

Pure bred livestock is still better than grade or scrub stock, even though prices have slid down hill, is the contention of C. M. Hubbard, livestock extension specialist of the Washington state college. To back up his contention Mr. Hubbard tells of the experience of D. E. Pearson, who made $12.50 more on a thousand pounds of pure bred steer over a scrub steer.

Before breeding registered Shorthorn cattle Mr. Pearson ran scrub cattle on the range, and as all he had were scrubs, he bred some to a pure bred bull. Three years later when the steers were ready for the market he received 10 cents on foot for the grades by the registered bull and seven and one-half cents for the scrubs. This made a difference of $25.00 on a thousand pound steer, but the grade steers of the same age, on the same pastures, drinking the same water and eating from the same strawpile, were about 75 pounds heavier and they averaged $32.00 per head more than the scrub steers. However, these steers were sold on a high market when the government wanted beef for the army.

Last year Mr. Pearson received one and one-fourth cents more for his grade steers bred from a purebred bull than for the scrubs. While this amount was small it amounted to $12.50 on a thousand pound steer. In drawing a line between the high and low market, a difference of nearly $20.00 per animal was found in favor of the high grade steer, sired by good pure-bred bulls, over the scrub sire.

EDGEMOOR FARM

Owned by W. H. Dupee

SANTEE, CAL.

WILL OFFER

51 REGISTERED GUERNSEYS 51

AT PUBLIC AUCTION

Rhoades & Rhoades Sale Pavilion

Hynes, California

Thursday, October 20, at 10 A.M.

THE FEMALES:

There will be 41 females in the sale, all heifers, and practically all are bred. A large number are bred to MASTERPIECE OF EDGEMOOR, one of the greatest young sires of the Guernsey breed, also some of the undefeated show bull DEANIE'S MAROSE OF APPLETREE POINT.

The offering includes granddaughters of Governor of the Chene, Spottswood Daisy Pearl, Rose of Lanwater and a considerable group sired by a double grandson of Governor of the Chene.

These choice heifers should meet with the approval of the many prospective buyers who wish a foundation of young registered Guernsey females of substantial breeding and bred to bulls of unusual merit.

THE BULLS:

The ten bulls in the sale list include a number ready for service, of desirable type and approved breeding, and should find favor with both breeders and dairymen.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO 60 DAY RETEST.

TERMS OF SALE: Cash unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in 3, 6 and 9 months, to responsible parties, with approved note bearing eight per cent interest.

Sir Prince Aaggie Mead

CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEDIGREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERD SIRE.

OWNED JOINTLY BY

Fred Hartsook, LANKERSHIM, CALIF. and A.W. Morris & Sons Corporation, WOODLAND, CALIF.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Figs and Persimmons

We have a fig (Brown Turkish). We think that the fruit sours and then rots and falls off. Could you tell the cause? Also fruit of Japanese persimmon keeps falling although it is about the size of a small apple at this time. We would appreciate any information.—Eagle Rock Subscriber.

Brown Turkey figs usually split when ripe, or before, and should be looked over every day and picked as soon as splits commence. Even if not split the aim should be to pick before very ripe. We believe this procedure will save all your crop. The persimmons doubtless fall through lack of pollination, though as a rule they drop before they reach the "size of small apples." When lacking pollination they hang on until slight unfavorable conditions arise, such as too much or too little water, unusually hot weather, etc. The remedy would be to plant a tree of some other variety to effect cross pollination, or graft into present tree a scion from a recognized "pollenizer." The best of this latter class is the Gailey.

Chicken Manure for Fertilizer

I would like a little information concerning the use of chicken manure where the land has been fertilized a little with horse manure. Is it a good plan to put chicken manure in the rows where potatoes are to be planted? And if so what proportion to the acre where potatoes are planted during the winter in the wet months?—Subscriber, Watsonville.

Chicken manure is one of the best of fertilizers. Experiments conducted at Riverside citrus station showed that quickest return was made from application of poultry droppings. However, care must be taken not to make too heavy an application or "burning" may result. If the manure can be incorporated with the soil by cultivation it becomes mixed and there is little danger of its being concentrated too heavily near the stalks of plants. The danger comes from the liberal content of ammonia which is somewhat caustic and liberates at once the nitrogen which it contains. It is a good practice to use it in connection with phosphate rock or even the acid phosphate. This acts as a preservative and puts the ammonia in a form less liable to injure by its quick action.

Van Slyke advises in the handling of poultry manure to make a "complete fertilizer" mixed as follows: 10 pounds poultry manure, 4 pounds saw dust or dry muck, 4 pounds acid phosphate, 2 pounds kainit. The manure may be applied at the rate of 500 or 1,000 pounds per acre.

Moving Peach Tree

Can a five or six year old peach tree be removed to another place without killing it?—Subscriber, Lincoln.

Yes, if removed in winter time when growth is entirely dormant and the tree cut back heavily it is possible to remove and make it live. In all probability, however, it would be impossible to get a thrifty bearing tree when moved at that age. It would be far more profitable to purchase healthy young nursery tree. It may be noted that nurserymen who end the season with surplus deciduous trees invariably burn them rather than endeavor to sell for orchard planting if more than a year old.

Pruning Olive Trees

Can you advise me on pruning olive trees? Should they be trimmed or not?—"A Subscriber," Rialto.

A satisfactory answer to this question would be too extended for this department. A complete article on the subject will appear in an early issue.

Guayule

The planting of guayule was taken up in Arizona some years ago and the production of rubber from it in a large commercial way thought possible and even offering a commercial success. We asked for information of the University of Arizona and have the following from Professor of Botany J. J. Thornber:

"There is a company about 30 miles south of Tucson that is engaged in the commercial growing of guayule. It has been organized and working for more than three years, and, I understand, will soon be able to realize the first crop of the material. In conversation with its botanist I learn that it has improved very much by breeding and selection, the percentage of rubber in the stems; also method of setting out the plants; and that it now feels it is in a commercial way to make a profit of growing guayule."

Rhodes Grass

This spring I saw advertised in the Cultivator Rhodes grass with statement that it would do well on alkali soil. I should like to hear more about it from our readers, and if one can destroy it after it once gets started and what time of year to plant it.—Subscriber, Lindsay.

Rhodes grass is tolerant of alkali. The University of Arizona has issued a leaflet in which is this sentence: "Its most promising field of usefulness in this state is on alkaline soils as it will grow and thrive on soils containing very large amounts of alkali." It also refers to the fact that the Rhodes grass has done well where alkali was so strong that no other growth excepting Australian salt bush would thrive. Before planting irrigate land heavily. The best time is perhaps the last of March to early May.

Cherries Not Fruiting

I have flourising cherry trees of red variety ten years old that blossom profusely but never have borne over a half dozen cherries. What is the trouble?—Subscriber, Pasadena.

Cherries are not a successful crop commercially in the interior valleys or in Southern California excepting in two or three localities. One of these is the Julian section of San Diego County, and another is the Yucaipa-Beaumont section of San Bernardino County. However, it is barely possible that by intersetting other varieties so as to secure perfect pollination you may occasionally grow good cherries in some other sections of the south. It has been suggested that by budding or grafting Black Tartarians on a part of these trees some fruits might be secured.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Dismissal of Suit

A suit has been commenced in the superior court. The defendant answered and filed a cross complaint. The action has been pending for two years and a half, but plaintiff has never brought it for trial. Can the defendant appear and ask for the dismissal of the action? If not, how long a period of time must elapse?—Subscriber, Winters.

The code provides that the court may in its discretion dismiss an action for want of prosecution on motion of defendant after notice to plaintiff when the plaintiff has failed for two years after answer was filed to bring action to trial and that the court shall dismiss the action after due notice to plaintiff, or on its own motion, unless the action is brought to trial within five years after defendant has filed his answer.

Joint Homestead

Property is in the husband's name. The wife filed a joint homestead. In event of the husband's death would the entire estate pass to the wife and would legal proceedings be necessary? What would become of personal property such as farm implements and stock? There are three minor children. In case of the death of both parents how would the estate be managed?—Subscriber, Hanford.

A joint homestead must be executed by both husband and wife; then upon the death of either of the parties the whole of the property will go to the survivor. A petition and decree showing the fact of the death of the husband would be all that is necessary in this case. However, the question states that the wife has filed a joint homestead. It could not be a joint homestead unless both parties join. If the property was community property, notwithstanding the fact that it stood only in the husband's name and the homestead was executed by the wife alone, then upon the death of the husband it would vest absolutely in the wife. It would, of course, be necessary for her to establish the fact that the property was community property in this case. If the homestead was selected from the separate property of the husband without his consent by the wife then on the death of the husband the property would vest in his heirs or devises, subject, however, to the power of the superior court in probate proceedings on the husband's estate to assign the property described in the homestead for a limited period to the family of the decedent. The property would not, however, be subject to any debt or liability contracted previous to the death of the husband. This exemption from liability would apply, however, only to the extent of $5,000. The homestead does not carry personal property. Personal property would be taken care of by administration of the estate. If the property was such as vested in the wife upon the death of the husband, then upon the subsequent death of the wife the homestead property would vest in the minor children, each taking equal share. In such case it would be necessary to appoint a guardian to care for their interests. The manner of the execution of the homestead, and the nature of the property stated in the homsestead mentioned makes a vast amount of difference in the probate of the estate.

Avoiding Probate

A wife expects to inherit property and desires it to be held, so that in case of her death it will go to the husband without probate. Could the wife make out a deed and give it to the husband to be recorded after her death?—Subscriber, Hanford.

Providing proof of delivery prior to death can be clearly made and deed can be delivered to a party with instructions to record after death such proceeding is legal, but such manner of providing for the contingency of death has given rise to a great deal of litigation. It would be better to have the property deeded to husband and wife as joint tenants with right of survivorship.

Trespasser

A party worked for us for three years, living in a house on our property with his father, rent free. He quit work and has now come back and refuses to leave the house, demanding 30 days' notice. The father still works for us and consents to have him leave, but claims that the son is right in his demand for formal notice. Can we get rid of him?—Subscriber, Loomis.

From the statement of the question, it does not appear that there ever has been any relation of landlord and tenant nor does it appear that there has been any tenancy at will. The matter is merely the employment of a workman on the place and provision for his quarters during the period of his labor. In such case it would be absurd to require a 30 days' notice. The man is simply a trespasser and could be proceeded against as such trespasser.

Employing Japanese

Is it against the law to hire a Japanese, allowing him to live on the land? I am a gardener and hire Japanese to do my work and furnish them quarters.—Subscriber, Inglewood.

There is no provision of law prohibiting such an act. The only provision of the law bearing on Japanese is to the effect that in case any interest of land is conveyed to one who is ineligible to become an American citizen that the state of California may bring an action to forfeit this interest to the state.

Support of Minors

My husband left me and my three children about a year ago. Under interlocutory decree the custody of the children has been awarded to me. The father has, however, contributed an amount insufficient to support even one. I take in washing to support myself and children. Could I obtain money through the mother's pension department?—Subscriber, Escondido.

There is no such thing as the mother's pension department. There is a fund which is administered through the juvenile courts, providing maintenance for minor children, both for orphanages and when maintained at home. You should take this matter up with the juvenile department of the county within which you reside. They would also undoubtedly take action on the criminal side of the courts to require the husband to adequately provide for these children. It may be that under the terms of the interlocutory decree the wife might be foreclosed from bringing contempt proceedings for the failure to support the children, but nothing that the wife can do can bind the children as to their claims on the father for their support nor is the decree final in respect to such children until they reach their majority. Criminal proceedings can be instituted against the father, compelling him to proceed to support his children in accordance with their station in life and with his income.

Foreclosure

I gave a mortgage to secure note, signed by myself and wife for $4,000. The mortgagee on foreclosure proceedings bid in the property for $3,000. Can he collect the deficiency from the mortgagors from other property which they own?—Subscriber, Simi.

After sale of the property upon foreclosure a deficiency judgment for the amount for which the property was bid and the total amount of the foreclosure is docketed and entered in the clerk's office of the superior court. This deficiency then becomes a lien upon any other property of the mortgagors in the county. Execution will issue upon such deficiency and sale of any other such property may be had as in the case of any other judgment.

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 40,000 subscribers. Weekly Liner rates: Single insertion 4½ cents per word; 45c per issue minimum charge. Cash with Order

Mail all classified copy to Los Angeles Office.

POULTRY

Continued requests are being received by the California Cultivator for varieties of poultry not advertised in our columns. If any of you, our readers and friends, have any you wish to dispose of, send a small advertisement to this office and you will be doing our readers a service as well as yourselves.

The M. A. Warren B. P. Rock Strain (former ad. Warren Poultry Yards), feather true to color; egg record 1920, 220; limited number single settings $2.50 per 15 eggs; balance 1921. Orders 1 and 2 sittings, with remittance, booked for 1922; last orders received subject to cancellation if output is sold. Stock yarded exclusively at 36 Little Delmas Ave. (across Willow). Packages carefully packed, sealed and expressed. Address Mrs. M. A. Warren, P. O. Box 517, San Jose, California.

Day Old Pullets—Here is your chance to get day old White Leghorn and Ancona chicks, guaranteed at least 90 per cent pullets. We are taking orders fast for October and November delivery. We also have R. I. Red and Barred Rock chicks but do not separate the sex. All chicks are from strictly thoroughbred laying stock and are hatched right and shipped by Special Delivery Parcel Post. Send for prices and get your orders in at once. Orange County Hatchery, Santa Ana, California.

OCTOBER—BABY CHICKS—JANUARY
Quality Stock—Reasonable Prices—
Good Service.
Write us about our R. I. Reds, Barred and White Rocks, Black Minorcas, White and Brown Leghorns. Book orders early and be sure. The Mission Hatchery, Box 27, Campbell, California.

Petaluma Hatchery—Established 1902 by L. W. Clark. White and Brown Leghorn chicks from heavy laying free range stock, every Monday and Thursday. We positively guarantee safe arrival and full count of good strong chicks and no questions asked. Send for prices and terms. L. W. Clark, Petaluma, California.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, $1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

White Leghorn Baby Chicks: Walter Hogan stock. We get all our eggs from one flock of over 4,000 Walter Hogan hens that have been carefully Hoganized. Our specialty is first class White Leghorn chicks that satisfy our customers. We will have chicks every week. Lyon Hatchery, Gardena, California.

Send 25c for four months' trial subscription to the quality poultry paper of the West. Every page alive with value and interest. Has helped thousands raise better poultry. Year's subscription 75 cents. The Pacific Poultryman, Seattle, Wash.

Baby Chicks—Barred Rocks and Reds, 25, $5.00; 50, $9.50; 100, $18.00; White Leghorns, 25, $4.25; 50, $8.00; 100, $15.00. Shipped every Monday, Parcel Post, special delivery, prepaid. Established 1915. Hargett & Son, Route 2, Box C, Compton, California.

Chicks Every Week from good layers. Fall Broilers pay. Pullets make good layers. R. I. Reds, Barred Rocks, White Leghorns. Safe arrival guaranteed. Write for circular. Stubbe Poultry Ranch & Hatchery, P. O. Box 67, Palo Alto, California.

Baby Chicks from my heavy laying, carefully selected strain of pure bred S. C. White Leghorns. I am booking orders now for September and October delivery. Good chicks at reasonable prices. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live, vigorous chicks guaranteed. No money in advance; pay on delivery. Prices on request. Established 1898. MUST HATCH INCUBATOR CO., 438 Seventh St., Petaluma, California.

Barred Plymouth Rocks — "Wonderful Layers," champion prize winners. Nothing better in poultry. Choice stock and hatching eggs. Catalog free. Charles H. Vodden, Los Gatos, California.

White Leghorn Baby Chix from Petaluma's heaviest producing stock. We guarantee safe arrival. Literature on request. Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

Watch Us Grow: Fall chicks, Rhode Island Reds, B. Rocks, White and Brown Leghorns and Anconas. E. W. Ohlen, Campbell, California.

Regal White Wyandotte cockerels, February hatch. White Feather Farm, Howard Burns, R. R. No. 1, Chowchilla, California.

"Eastman's Bred-to-Lay" Barred Rocks. Fall Chicks—March, April pullets. Fairmead Poultry Farm, Fairmead, California.

Success in business is attained by experience and knowledge. The poultry business can be made to pay by following the teachings and information contained in POULTRY FOR PROFIT, $1.00 postpaid. Cultivator Publishing Company, Los Angeles, California.

HORTICULTURAL PRINTING

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

FARM LAND FOR SALE

FARM RENTERS
You can become a farm owner on terms very much like those you are now paying to rent land. We have deep, rich soil with complete irrigation and drainage systems. We are willing to cooperate with hard working, reliable men who want to become owners of farms. Sutter Basin (in the heart of the Sacramento Valley) is your opportunity. Write now.
SUTTER BASIN COMPANY,
California Fruit Bldg., Sacramento, Calif.

Greenhouse—About 8,000 ft. glass, 5 acres, 6 room house, bath, hot and cold water, barn, outbuildings, fruit and berries; 7 miles city of Portland, Oregon; paved highway; ¼ mile to grammar and high schools, city water. Price $8,500. Would consider part cash and trade. Write Beaverton Greenhouses, Beaverton, Oregon.

For Sale—65 acres deciduous fruit land, 15 acres cleared; balance partly cut over pine and oak. Buildings, family fruit, berries; 2,000 feet elevation; pressure irrigation system, R. R. siding adjoining, electricity available; live American community. Good school and church, on main road. $6,000 for quick sale. C. H. Eckles, Paradise, Butte County, Cal.

For Sale: 45½ acre dairy, milking 28 cows; 30 acres alfalfa, modern sanitary barn and milk house, shop, tools all complete, 6 room house and bath, family orchard. Price reasonable, terms. For further particulars address Box 271, Soledad, California. Phone 19F5.

Lake County Land for Sale—Bearing pear and prune orchards, dairy and stock farms. Alfalfa and grain land and other properties. Address Joe Hyman, Lakeport, Lake County, California.

125 Acres, Tulare County, clear, level, plenty water for irrigation. Sell or trade for Southern California property. $12,000, terms. Inquire owner, Jas. S. Beardsley, Julian, California.

20 Acre Alfalfa Dairy Ranch, none better in Turlock irrigation district; also cows, hay. Harmon Berg, Hughson, Cal.

For Sale — Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

CATTLE

For Sale — Several registered Guernsey bull calves, one old enough for service, Edgemoor Farm breeding, reasonably priced. Apply to Dr. J. A. Woodside, Santee, San Diego County, California.

Guernseys — Grape Wild Farms—Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

For Sale—My herd bull, Finderne Soldene Pontiac Valdessa 206927. His dam, granddam and great granddam were all World's Record cows. Great bargain. Geo. A. Smith, Corcoran, California.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Yearly Record Holsteins—Bulls from 500 to 1,000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Some Choice registered Holstein heifers and bulls of serviceable age for sale. J. W Scudder, Escalon, California.

Winsor Ranch Jerseys—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

MACHINERY

For Sale — Another big drop. Rebuilt windmills, tanks, pumps, cylinders. Why pay more. We make galvanized tanks, 400 gallons, $16.25; 600, $26.25; 1000, $37.25; 2000 capacity, $48.25. New irrigating pipe, 3-in., $13.50; 4-in., $17.50. Demmitt Co., office 120 N. Main, L. A. Phone 15191.

For Sale—Bean Tractor in good condition. New steel drive sprocket. At Rincon Garage, J. W. Anderson, Carpinteria, California.

SEEDS AND PLANTS

Strawberry Plants for the Pacific Coast, such varieties as Nick Ohmer, Marshall, Kellogg's Premier, Klondyke, and about 30 other varieties; also Dewberries and Raspberries. Ask for free catalogue. V. R. Allen, Seaford, Delaware.

For Sale — Mountain Grown Strawberry Plants for fall planting. Carolina $2, Banner $1.50, Klondike and Brandywine $1.25 per hundred by mail postpaid. B. Bryan, Camp Baldy, California.

LIVESTOCK

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

CORN HARVESTER

Corn Harvester cuts and piles on harvester or winrows. Man and horse cuts and shocks equal Corn Binder. Expressed to every state. Only $28 with fodder tieing attachment. Testimonials and catalog FREE showing picture of harvester. Process Harvester Co., Salina, Kansas.

TREES

Carobs: California Wonder Tree, 10 to 20 tons to the acre of richest food grown; beautiful evergreen ornamental tree, fine for parkway, unsurpassed for windbreaks. Carob is not a soil robber but a nitrogen feeder. Send $2.00 for four sample trees; plant now. Original Carob Nursery, Colton Ave., No. 2, Box 60, San Bernardino, California.

FOR SALE — 100,000 SOUR ORANGE SEED BED STOCK; WASHINGTON NAVEL, VALENCIA LATE ORANGES AND EUREKA LEMON TREES; ALSO FUERTE, LYON, PUEBLA AND DICKEY "A" AVOCADO TREES. T. J. WALKER, FIRST NATIONAL BANK BUILDING, SAN FERNANDO, CALIFORNIA.

For Sale—Grafted walnut trees, also citrus and deciduous trees. Order now for 1922 delivery. Get my prices. Ketscher's Nursery, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.

Reliable Trees and grapevines at a fair price. Write us for price list. We ship on approval. J. F. Miller & Sons, Healdsburg, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier California. Selected stock for sale; inspection invited.

DUROC-JERSEYS

Weanling Boars and Gilts by Pathfinder Wonder (Great Wonder I Am ex an 800 lb. Pathfinder sow) for $10 each. Bred sows and gilts. Derryfield Farm, Capital National Bank Bldg., Sacramento, California

For Sale—Pedigreed Duroc-Jersey hogs, pigs, none better, priced low. Large kind, Orion's Defenders, Pathfinders, Rhode Island cockerels. John Kincaid, Mayflower Stock Farm, E. Bakersfield, California.

Greenwood Farm Durocs — Moderate prices on bred gilts and weanling boars. Select individuals. Most popular breeding. H. C. Witherow, Mgr., Live Oak, Sutter County, California.

Boyanna Big Type Durocs — Breeding stock, priced right for sale. Inquiries invited. Satisfaction guaranteed. J. Boyd Harrold, Dixon, California.

Big Type Durocs—Better Durocs at right prices. Harvey M. Berglund, Dixon, California.

Winsor Ranch Durocs—The best of stock at reasonable prices. BONITA, CALIFORNIA.

BERKSHIRES

Berkshire Gilts—Bred for late spring litters. Boar pigs of breeding age. Calac Orchards, Martinez, California.

TURKEYS

For Sale — White Holland Toms, six months old, large, healthy birds of fine stock. For information write Garfield Johnson, Box 116, Fairoaks, Cal.

Bourbon Red Turkeys, Buff Orpingtons. The Ferris Ranch, Reservoir Street, Pomona, California.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents

RABBITS

Pedigreed Flemish Giants — No fancy prices. Maud Beeching, 1578 W. 46th St., Los Angeles.

MISCELLANEOUS

Get Maximum Income from your land by having your irrigation and drainage problems properly attended to by the Engineering Service Company, 1316 Washington Building, Los Angeles, California.

When Planting Alfalfa, Clover or Peas treat your seed with Pennewell's Pure Culture Soil Bacteria. Costs only 50c an acre, postage paid. None better. Penn Laboratories, 461 Market St., San Francisco, California.

Avoid Law Suits by having your property lines properly surveyed and established by the Engineering Service Company, 1316 Washington Building, Los Angeles, California.

Mountain Honey—Best light amber, 5 gallons up at 10c lb. f. o. b. San Diego; sample, 15c. Geo. B. Dickerson, El Cajon, Cal.

Beeman Tractor Cheap — Dwarf pears. Cash Nursery, Sebastopol, California.

ADVANCE IN SPRAYING

By Robert K. Vickery

The advances made in the last two years in spraying methods have been numerous.

In California the brown rot of the apricot has yielded to a spray of lime-sulphur or Bordeaux applied just prior to blossoming. Bordeaux is the most popular as it is the least injurious to the tree. This work is the result of experiments done at the new experiment station at Mountain View.

The use of nicotine dust for the control of other insects besides the walnut aphis has become general. The horticultural commissioner of Santa Clara County, L. R. Cody, and his deputy, D. L. Currier, with Professor O. E. Essig, have demonstrated that five per cent nicotine dust is the best control for thrips. The large seed companies are using ten per cent nicotine dust for the control of the much dreaded pea aphis on the seed farms. The leaf hopper on the grape is also being controlled by nicotine dust.

There has been a general tendency throughout the country for the saving of crops of all sorts from insect depredations. The lessons of food conservation learned in the war have sunk in and spraying is much more general than in the past.

Cotton is now dusted with calcium arsenite. Hundreds of thousands are spent in spraying sugar beets with Paris green in Utah and Colorado. Zinc arsenite is now used on the Atlantic seaboard in controlling truck crop pests. The farmers and fruit growers are insisting on better grades of insecticides and are looking for the chemical formula on the package rather than being satisfied with some high sounding name.

AMERICAN POMOLOGICAL SOCIETY

The thirty-eighth convention of the American Pomological Society will be held this year in Toledo, Ohio, December 7-9. The meeting will be in conjunction with the National Farmers' Exposition annually held in that city. A considerable exhibit of fruits and by-products will be staged in connection.

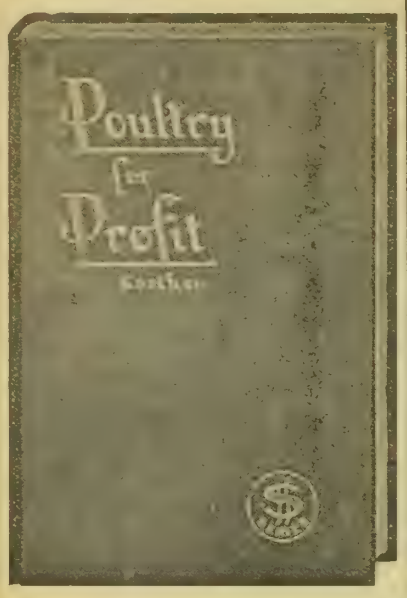
The American Pomological Society, founded in 1848, is one of the oldest agricultural institutions in the country. It has had a long and successful history and has been of large service to the fruit industry throughout its life. Its membership is found in the United States, Canada and a number of other foreign countries.

Colusa County won first place at the state fair on improved prunes grown by Campbell and Dwyer; also first on Eureka lemons, corn on the stalk, Egyptian corn, rough rice and green tobacco.

FOUL BROOD IN BEES

A writer in "L'Apiculture," Paris, France, says: "Beekeepers whose stock is attacked by foulbrood are usually those who take their honey too early and use composite hives arranged in such a way that they always obtain relatively large quantities. Taking the honey and replacing the frames of these hives for the bees to clean are two operations that encourage the queen to lay at the very time when she ought to be prevented from so doing. If the honey supply continues, no harm is done, but if the honey season is finished, which is generally the case in districts where foulbrood is rife, there is a great risk that the bees seeing their emptying frames, will let part of the brood die on account of want of honey."

Poultry Can Be Made Profitable



Making use of information gathered from experienced poultry writers who have been guided by their practical experiences will always result in profit from poultry.

Poultry Parasites

By Jean A. Koethen

THE parasites which live either on or in the bodies of fowls and turkeys, or nests, roosts and walls of houses, are classified as external and internal parasites, and all have their origin in filth. Let us be quite clear on this point. Dependent as it is on its caretaker for cleanliness, whether it be of body, food or environment, the domestic fowl is necessarily the victim of the filth which it is powerless to remove. Lice are bred in the filth on the skin of the bird; mites in the filth on dropping boards and in nests; gape worms and intestinal worms in the filth of the soil from which it is forced to pick its food; the mite which produces scaly leg in the piled-up droppings of dirty yards. The only parasite which may possibly not originate in filth is the stick-tight flea which seems to be indigenous to certain sandy soils, and I doubt if you will find even stick-tights in a perfectly clean and sanitary hennery. The poultryman who keeps his houses and yards perfectly sanitary has little trouble with parasites.

External Parasites

Lice, mites, ticks, fleas, scaly leg and the depluming mite are the six parasites which get their living from the skin and blood of the bird. Lice, the scaly leg mite and the depluming mite must be attacked on the body of the bird. Mites, ticks and fleas live for the most part in and about the poultry house and must be attacked there.

Lice may be assumed to exist on the body of every bird that has not been dusted, greased or dipped to remove them. Leghorns are less suspectible to their atacks than the heavier breeds and the Asiatics are lousiest of all. Mediterraneans which have access to a dust bath will almost keep themselves clean, but most commercial poultrymen go over their flocks once or twice a year with some good louse powder. Sodium fluoride is recommended by the department of agriculture for dusting. What is known as the Lowry powder, made by mixing 3 parts gasoline with 1 part crude carbolic acid (90-95 per cent strength) and stirring in enough plaster of Paris to take up all the moisture, is cheap and effective, and there are various prepared powders. For little chicks and turkeys there is nothing quite so good as buhach insect powder. Blue ointment, a mercury preparation, mixed with lard, a pound of ointment to a gallon of lard, and rubbed about the vent, is preferred to dusting by some experiment stations. Greasing chicks on heads and under wings with lard keeps them from becoming lousy.

For ridding a house of mites some one of the many coal tar preparations is generally used. This may be crude carbolic acid mixed with kerosene in the proportion of 1 to 10 or stronger, or carbolineum, which is much the same thing, or a cresol preparation. When mites are already in a house it is safest to paint with one of these insecticides three times, a week apart, being careful to hit every crack and crevice. Grease alone on roosts and droppings boards is sometimes found effective. One man uses the oil from his automobile engine, another goes over his roosts once a year with hot mutton tallow. Anything that fills up cracks helps to keep these pests out, provided the wood is perfectly clean when it is put on. Whitewash containing crude carbolic acid is an excellent insecticide until the whitewash begins to peel off. Whatever insecticide is used will be of little avail without cleanliness before and after.

The treatment which keeps mites from a house or kills them after they are in will also keep it free from ticks and fleas. Stick-tights, which fasten themselves into the flesh of head and comb, are easily killed by repeated applications of carbolated vaseline. When ticks have once gotten possession of a house nothing but fire will positively and fully eradicate them, but ticks never take possession of a house that is kept reasonably clean. Many poultrymen prefer shavings or sawdust to straw for nests because mites and fleas are less likely to infest them.

Two Troublesome Mites

Depluming scabies and the scaly leg mite are less easily reached than the ordinary chicken mite because they live on the body of the fowl. Depluming scabbies or the feather mite may be detected by running the finger along the surface of the skin where feathers are missing. If the skin is smooth the feathers have been pulled out by other birds, if the ragged stumps of the feathers are left the feather mite is at work. As this mite finds its way readily from one bird to another affected birds should be isolated and the infested areas rubbed with oil of caraway ointment, Balsam of Peru, or a mixture of flowers of sulphur (1 dram), carbonate of potash (20 grains) and lard or vaseline (½ ounce).

Scaly leg is also quite contagious, and no affected bird should ever be introduced into a healthy flock. Oil of caraway mixed into an ointment with vaseline (1 part oil of caraway to 5 parts vaseline) is a remedy. This is rubbed into foot and leg every few days till the cure is complete. When many birds in a flock are affected dipping their legs at night into a mixture of kerosene and raw linseed oil (1 part kerosene to 2 of oil) is often effective, but kerosene is more irritating than oil of caraway and care must be taken not to wet the feathers with it.

In addition to Mrs. Koethen's suggestions we may add that poultry supply houses often have excellent proprietary insect destroyers and poultry remedies.

Internal Parasites

Round worms, tape worms and gape worms are the only internal parasites which are common enough to require consideration here. For the common round worm which is usually meant when we say a fowl has "worms" there seems to be no better remedy than the tobacco treatment recommended by our own poultry division. A pound of dry tobacco dust or powder is mixed in 50 pounds of dry mash, and this is kept before the birds for three weeks and then removed three weeks. If there is still evidence of the existence of worms the medicated mash may be used another three weeks and then removed again, and this treatment continued till the worms have disappeared.

For tape worms, which are now and then found in the intestines of both chickens and turkeys, pumpkin seed, chopped, is the commonest remedy. The birds may eat as freely of them as they will. A teaspoon of powdered pomegranate root bark for every 50 birds, mixed in the feed, is one of the best remedies, but pomegranate root is hard to get. Male fern in the form of powder (dose 30 grains), or in liquid extract (dose 15 to 30 drops) may be given morning and evening before feeding. Whatever remedy is used, it should be given while the birds are fasting and followed with a dose of castor oil or of Epsom salts mixed in a little moist mash.

Gape worms are sometimes found in the windpipes of young chickens that have been kept on filthy or infected ground. Extracting the worms by means of either a gape worm extractor or a small quill feather stripped of all its web except a small tuft on the end is the only certain cure. The feather is dipped in kerosene or oil of turpentine, then pressed down into the windpipe, the beak being held open by the thumb and finger of the left hand. At the first insertion the feather should not be forced more than an inch below the glottis. It is then given a quick turn and withdrawn. If any worms adhere they are removed and burned, and the extractor again inserted. Good results have been reported in some cases by giving the birds 15 grain salicylic acid or 3 drams salicylate of soda in a quart of drinking water.

SOUTHERN CALIFORNIA FARM BUREAU EGG LAYING CONTEST BUILDINGS COMPLETE

PLANS for the egg laying contest which will start October 1 are about complete, the buildings have been finished for several days and some of the detail work is nearing completion at this time. The contest is an outgrowth of the recently organized poultry departments of the farm bureaus in several Southern California counties, and has been adopted as an official project by these farm bureaus as well as by the state farm bureau and the poultry division of the University of California. Egg laying contests have for several years been very successful in building up the average production of flocks in various other sections. Two other contests are under way in this state, one at Santa Cruz which is in its second year, and one at Petaluma which is in its first year. If the poultry industry of Southern California is to compete with other sections it will be necessary to use more care in the selection of birds and the use of reliable records which can only be obtained by the use of trap nests. It is with this idea in mind that the egg laying contest was organized, enabling poultrymen to send 12 birds at a very nominal cost, $2.00 per bird, per year, making $24 for the pen, much less than it would cost poultrymen themselves to trapnest, and these birds will be trapnested for an entire year by those who cannot be accused in any way of being prejudiced for or against any flock. These birds are returned to the owner at the end of the year, when they can be used for breeding purposes, at which time they should be mated to cockerels from a high producing pen. Cockerels from these high producing hens can then be mated with selected birds from the remainder of the flock, which will result in the improvement of the entire flock average, which will show up within the following year.

The cost of having the birds trapnested is incidental compared with the results that may be obtained from the use of only a very small percentage of these birds should they prove to be high producers.

The contest also serves to bring out comparisons between the different strains and types of birds as all in the contest are fed and housed in exactly the same way. This gives the breeders a valuable asset, in case their birds lead the contest, and buyers may know from just what strains and what kind of birds they may be buying their baby chicks.

The houses to be used in the contest are the shed roof type recommended by the University of California and which is giving the very best of results all through Southern California with the minimum of expense for building. These houses were selected in order to give poultrymen visiting the contest grounds an idea as to good workable plans which they

Winners of The California Egg-Laying Contest 1920

If you are in the poultry business for eggs, investigate this wonderful strain of trapnested White Leghorns. Write for a catalog. It will interest you to know how these hardy, range bred birds have won their reputation.

may use on their own commercial poultry farms. There will be nothing in the contest but can be used to advantage on commercial poultry farms.

The contest is planned to take care of 50 pens of 12 birds each, records to be counted for the ten highest in each entry. Some experimental work for the benefit of poultrymen will also be conducted. Many poultrymen are donating two birds each for this experimental work. Poultrymen desiring to make such contributions should notify G. E. Gordon, 361 Courthouse, Los Angeles, who will make arrangements for their collection; although if the owners can deliver them to the contest grounds it will relieve the committee very considerably.

There is room for 50 entries and entries have not entirely been filled yet. Applications for entry should be sent immediately to Mr. Gordon, and birds delivered a week or ten days before the contest starts on October 1. Copies of rules and application blanks can be secured from the farm advisors in Southern California counties, from the egg laying contest committee, and from various local poultry associations.

Poultry Queries

(Conducted by Jean A. Koethen.)

Pendulous Crop

Two of my hens have crops so large that when they walk they strike them with their feet. They seem healthy, but the crop is full of water.—Subscriber, Oakdale.

This enlarged crop is rather common among turkeys but this is the first case I ever heard of among hens. It is generally due to irregular feeding. In this case I could not say what is the cause without knowing more about the way in which the hens have been fed. Probably they have been stuffing their crops with something very bulky and hard to digest which has permanently distended them. You might relieve them by bandaging the crops rather tightly, but if the hens are not very valuable it would be better to eat them while they are still eatable.

Feeding Formulas

Please tell me where I can get pamphlets on feeding for 100 hens. Are any published at Davis?—Subscriber, Blue Lake.

Yes, the poultry division sends out what it calls a feed letter. The last I have seen, No. 12, suggests this mash mixture: 50 pounds each bran, shorts and ground barley or oats; 10 pounds each soybean or linseed or cottonseed meal (any two); 30 pounds meat or fish scrap; 5 pounds charcoal and 1 pound salt. The mash mixture of 100 pounds barley and 50 pounds each of Gyp corn or milo and cracked Indian corn is fed, a pint in the morning and a pint and a half at night for 15 hens. This would be eight to nine quarts per day for 100 hens. A postal card addressed to "Poultry Division, University Farm, Davis, California," will bring this and any later bulletin or letter.

Leg Weakness

Our spring chickens lose the use of the legs entirely, and we are unable to relieve them. We feed good wheat, bran mash, wet with sour whey and a poultry tonic, cooked potatoes, lawn clippings, and nearly every day fish meal, beside grit and fresh water.—Subscriber, Ceres.

I think your chickens are getting a ration that is too fattening. Potatoes, you know, are all starch. As you do not mention proportion of fish meal to other parts of the ration, nor amount fed daily, I can only conclude that this fattening ration, in connection with close confinement, is making their bodies too heavy for their legs. Give your chickens a prepared laying mash, with wheat at night and sprouted oats morning or noon. Your lawn clippings may not be sufficient green. Cut alfalfa would be better. If that is not available perhaps you can make green vegetable leavings, like lettuce leaves, and melon rinds take its place. If you can let your chickens run even a short time every day you will be surprised to see how the exercise will strengthen their legs.

Swellhead

Do the germs of swellhead or roup in turkeys carry over from one year to the next even though the flock be all disposed of? If so, what is the best means of eradication?—Subscriber, Lancaster.

Roup may be contagious, though it seems that epidemics are induced by conditions which affect all the flock, rather than by contagion, but it is certainly not infectious like chicken pox. This being the case, the only way in which the germ can be carried over from year to year is in the bodies of the birds themselves. Turkeys and chickens which have once had roup are almost certain to pass on a predisposition to the disease to their progeny. This is why we say, "Never allow any bird that has had roup to be used as a breeder." If your stock is not roupy, and the birds roost out of doors, there is no reason why they should develop roup.

Ticks

I am sending bottle containing bugs found under the ends of perches in the chicken house. After finding them I poured kerosene on perches and into all cracks.—Subscriber, Fowler.

The specimens are fine, healthy ticks, the meanest pest that infests any chicken house. Kerosene will not kill them, except the few it may drown. If you dip the ends of the roosts in crude carbolic acid, taking care that it soaks into all interstices, and then paint the roosts and walls and every other bit of wood in the house with a mixture of kerosene and crude carbolic acid, making the acid at least 20 per cent of the mixture, and paint again at the end of a week, and again in another week, you may get rid of them, but you must keep painting and spraying as long as there is a sign of them left, and then regularly once a month thereafter.

Molting Feed

What is the best feed for hens in the molt?—Subscriber, San Fernando.

Most poultrymen pay very little attention to the molt except to see that the hens are well fed. Some give a moist mash, wetting the dry laying mash with buttermilk or sour skim milk, and feeding at noon all the hens will clean up quickly. Sunflower seed, when it is not too expensive, may be added to the grain ration in small quantities. A little linseed meal in the mash is also helpful in feather making, but the chief reliance is placed on good care and plenty of wholesome feed.

ORCHARD MANAGEMENT STUDIES IN TULARE COUNTY

Prof. R. S. Vaile writes further of meetings in Tulare County held to discuss results of studies made the past two years in Tulare County citrus groves. The Cultivator of September 3 gave substance of report made at the Strathmore meeting:

"I believe our meeting at Lemon Cove and Porterville the other day was a fine success. From 75 to over 100 people attended the various demonstrations and a splendid interest was indicated. In the morning we visited our plots in the Kaweah Lemon Company's property at Lemon Cove where we have seven different methods of handling the heavy adobe soils; of these, the standard Southern California practice of winter cover cropping with spring plowing and deep summer tillage, seems as good as any up to date, although the constant and almost exclusive use of a plow for tillage purposes has shown some marked advantages, particularly in restoring the soil to its original dry bog structure. Summer cover cropping and surface mulching with straw have not shown anything of particular merit either way as yet.

"We next stopped at the Anderson orchard at Lindsay where we have been conducting moisture determinations on the lighter sandy loam soils of the district. The indications here are pretty clear cut to the effect that more frequent irrigation would be of decided advantage.

"In the afternoon we visited the Ball-Emery groves of Porterville and there we have a repetition of the plots shown at Lemon Cove. There is also a very clear cut demonstration of the value of scale control for certain rows left untreated for scale until this fall have barely half the crop on them that adjoining rows have, on which the scale was thoroughly controlled.

"There was a very large attendance at the Strathmore high school in the evening."

Prof. Vaile expects to spend the next several months in Cambridge on Sabbatical leave.

THE LIFE OF THE TRACTOR

Much has been said and written about the probable life of the tractor, but as J. B. Bartholomew points out, we have not the data available from which to make definite calculation.

He says: "Great prominence was given to the wonderful work done by the tractor at the front during the great world war. But we seem to have overlooked the great work done by the tractor in the field on our great areas of fertile lands. Many tractors were purchased before the great war was dreamed of, and a great many more purchased during the war. These are the machines that did the big work in producing the surplus food available to supply not only our own great army, but in a large way the armies of our allies. Most of these tractors are still in successful operation going steadily ahead, serving their purchasers after repaying their cost many times over."

1000 Eggs In Every Hen

If you Keep Chickens, Cut This Out—Four to Seven Eggs a Week Per Hen Through Cold Winter Season. With Eggs at Dollar a Dozen, Means $5.00 Profit per Hen in Next Six Months. Amazing Poultry Secrets Revealed by

AMERICA'S FOREMOST POULTRY EXPERT

This is an offer no reader of this paper who keeps chickens can afford to ignore. We will tell you why.

Henry Trafford. Famous Poultry Expert and Breeder, for nearly eighteen years Editor of "Poultry Success," has developed a new and remarkable system of rearing, breeding and feeding chickens for heavy egg production that seems certain to revolutionize the poultry industry and give five eggs or more for every egg produced today. This plan or system is explained in Mr. Trafford's "1000 Egg Hen," a free copy of which will be sent to any person who keeps six hens or more.

Poultry keepers, following Mr. Trafford's directions, learn how to start young pullets laying early; make old hens moult quickly and resume heavy laying during entire winter season. Most any hen will lay in spring when eggs are cheap. Mr. Trafford tells how hens lay four to seven eggs a week during coldest winter days when eggs sell at a dollar a dozen or more. His system shows how any breeder, with ordinary care, may get 1,000 eggs or more from nearly every hen in four to six years' time at a net profit of $25.00.

There is big money to be made with chickens this winter by the man or woman who gets the eggs. The time to get the hens ready for heavy laying is now. Mr. Trafford's "1,000 Egg Hen" system tells how and arrangements have been made whereby any reader of this paper may receive one copy absolutely free by using the Coupon below. Send no money, but cut out the Coupon and mail it with your name and address to Henry Trafford, 243-B, Court Bldg., Binghamton, N. Y., and the story of the 1,000 Egg Hen will be sent you by return mail.

Date, 9-24.
Los Angeles, Cal., California Cultivator

This Coupon entitles holder, provided he keeps six hens or more, to one free copy of Mr. Trafford's "1,000 Egg Hen." Write name and address plainly and enclose in envelope with this coupon. Address Henry Trafford, 243-B, Court Bldg., Binghamton, N. Y.

BATTERY & IGNITION EXPERTS IN DEMAND AT BIG PAY

LEARN IN SHORT TIME IN FINEST CLIMATE IN THE WORLD

Throughout the entire period of business depression, Los Angeles has been the one bright spot on the business map, and with it's thousands of miles of perfect boulevards and rich ranching districts, the demand for skilled mechanics in the Auto and Tractor line throughout Southern California far exceeds the supply. Come and become a trained mechanic under ideal climatic conditions in the largest and oldest Auto and Tractor institutions in Western America. (Est. 1905). Our graduates in great demand. One low tuition fee covers unlimited instruction in every department. Auto Repairing, Ignition Work, Battery Work, Driving, Machine Practice, Vulcanizing and Tractioneering. Tools Free. No extra charges. You can earn board and room while learning. Skilled men make up to $400 per month. More than 9,000 satisfied graduates. Write today for free illustrated Catalog of Facts.

Stocktons: Burbanks choice 2.60, fancy 2.75@3.00. Baking stock: Best 3.50@3.75. Sweet Potatoes: Supplies moderate. Movement slow, market steady. Locals. No. 1, 90@1.10 per lug; No. 2, 75@85 per lug. Jobbing: 2½@3 per lb.

Onions: Supplies liberal. Movement good, market firm. Locals: Whites, sacked per cwt. 3.25, Browns 3.10@3.15, Spanish Sweets, supplies light 3.50. Per lug: Browns 1.00@1.15, Whites 1.15@1.25. Stocktons: Whites 3.50, Yellows 3.60, Green onions, best 15 per bunch.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock September 20, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Beans: Supplies light. Demand moderate, market firm. Per lb.: Kentucky Wonders mostly 6@7 per lb.; Green pods mostly 5@6. Limas: Supplies liberal, movement moderate, market steady, mostly 3@3½.

Beets: Supplies moderate, market steady. Per dozen bunches mostly 35 45.

Cabbage: Supplies liberal, market firm. Per field crate best, 2.75@3.00.

Carrots: Supplies moderate, market steady, per dozen bunches mostly 35@40.

Celery: Slow, market steady, per crate 5.00@6.00.

Corn: Supplies light. Movement moderate, market weaker. Locals: Per lug mostly 75@85, few fancy 90@1.00.

Cucumbers: Supplies liberal, movement moderate, market steady. Locals: mostly 50@65; pickles, 1.50@1.75; few 2.00 per lug according to size and quality.

Eggplant: Supplies liberal, demand moderate, market firm, lb. 5@6.

Lettuce: Supplies liberal. Movement good, market steady. Local: Field crates, best 1.00@1.25, poorer 75@85.

Okra: Supplies light. market steady, fancy, small, 7@12 per lb.; poorer, 7.

Peppers: Supplies heavy, market steady. Locals: Bells mostly 35@40 lug; poorer 30; Chili, 3@4 per lb.; lug best, 35@40; poorer, 25.

Squash: Supplies moderate, market steady, summer best, 65@80 lug.

Tomatoes: Supplies heavy. Demand and movement slow, market steady. Locals: No. 1 per lug, fancy 90@1.00; No. 2. 50@75.

Turnips: Supplies light. Market firm. Per dozen bunches 40@45.

FRESH FRUITS

Apples: Supplies heavy. Demand and movement very slow, market weak. New stock: Mostly 3@4; fancy, 5@7; poorer 2½; Sebastopol: "B" grade Gravensteins, tier Bellflowers, 1.60@1.70; 4½ tier, 1.40; medium to large sizes mostly 1.75; small sizes, 1.25@1.50. Watsonville: Fancy 4 tier Bellflowers, 1.65@1.75; 4½ tier, 1.40; "B" grade, 4 tier, 1.40@1.60.

Cantaloupes: Supplies heavy, demand and movement moderate, market weaker. crates, best, 60@75; poorer, 50; jumbo crates, best, 1.25@1.40.

Figs: Supplies moderate, demand good, market steady. Locals: Per box, mostly 1.00@1.25; few fancy, 1.35@1.50.

Grapes: Supplies liberal, movement moderate, market steady. Wide range in quality. Muscat, 4½@6½; Tokays, 8@10; few fancy Black Hamburgs, 6@7; Concords, 10@13; Black Prince, 6@7; Thompson Seedless, 4@5 per lb.

Peaches: Supplies liberal. Demand moderate, market weak. Freestones mostly 1.00@1.25, few best 1.35, poorer 75@95 per lug; per lb., best 5@5½, Clings, mostly 1.00@1.25, few 1.35; per lb., 3½@5½.

Pears: Demand and movement good, market firm. Bartletts mostly 5@7; poorer, 3½@4 per lb.

Prunes: Supplies moderate, demand 4½@5½ per lb., mostly 4, according to quality.

Quinces: Lug 80@1.00; best, 1.15.

Watermelons: Supplies heavy. Demand moderate, market steady. Locals: Klondikes mostly ½, few ¾ per lb.

CITRUS FRUITS

Grapefruit: Supplies moderate, movement moderate, market stronger. Local: market pack, mostly 3.50@3.75; smaller 2.50@3.00; special packed 3.75@4.00.

Lemons: Supplies liberal. Demand moderate, market firm. Local: Special pack mostly 5.00@5.25; few 5.50@5.75; market pack best, 3.50@3.75; poorer 2.75; lugs 1.00@1.25.

Oranges: Supplies moderte. Demand moderate, market firm. Special brands mostly 5.00@5.25, few 5.50, market pack 3.50@3.75, small sizes 2.25@2.75, loose pack 1.00@1.50, mostly 1.00@1.25.

HONEY

Supplies of white honey nearly cleaned up account short crop and good demand. Production of fancy grades considered only 25 per cent of normal. Moderate supplies of other grades new crop but old crop supplies nearly exhausted. Light nectar flow from beans anticipated. Demand fairly active past two weeks and prices advanced slightly. Market firm at present. Carload f. o. b. usual terms at loading points. White orange, 10½@11¼; white sage, 9½@11; light amber sage, new crop, 7@8; old crop, 7; light amber alfalfa, new crop, 5¼@5½; old crop, few sales, 5½. The quality of new crop alfalfa and sage said to be variable, due to the unfavorable season. Beeswax: Supplies moderate, demand light, market weak. Growers receiving 22@23; dealers asking 25 for crude wax.

GRAIN AND FEEDS

Grain Exch. price bid September 20:
Barley: 100 ton lots, Oct. del., 1.30.
Milo: 100 ton lots, Oct. del., 1.50.

HAY

Alfalfa Growers of California report:

Our Northern Association has during the week filled two more orders for several hundred tons each for Eastern shipment. The railroad commission held hearing in Los Angeles this week on reduction of freight rates from San Joaquin Valley and Imperial Valley to Los Angeles, on hay, butter, milk and cattle, but principally hay. Cost of production of alfalfa hay in the Fresno section submitted as basis of complaint, from data furnished by our Fresno association. Our association will use its best efforts to obtain reductions in rates all along the line.

There were 260 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending September 17, with 30 tons held over.

Prevailing prices last week f. o. b. Los Angeles:

No. 1 Dairy 21.00
Standard Alfalfa 16.00

Quotations by Nichols - Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats .....18.00@26.00
Barley .....16.00@24.00
Alfalfa, Rabbit .....20.00@24.00
Alfalfa, No. 1 Dairy .....18.00@20.00
Standard .....16.00@18.00

HOPS

From 14@23 per lb. for 1920 California crop; do, 1921 crop, 26@30½, according to quality and district in which grown.

HAY AND FEED

Cal. Alfalfa Growers Assoc.:
No. 1 Dairy.....$15.00
Standard Alfalfa 13.50

Receipts 1,563 tons compared with 1,752 last week. Local demand shows no improvement. Throughout the interior condition spotted. Where there is still storage room prices are held firmly at a little over the market. Alfalfa has been dull and quiet. A little export trade has aided the situation this week. Mill feeds are, if anything, a bit lower and dependent upon Eastern market fluctuation. We quote today wholesale prices in carload lots as appear from dealers' transfers

upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission, and handling expenses must be added, according to conditions).

Wheat Hay No. 1	15.00@18.00

Citrus Markets

Los Angeles, Sept. 21, 1921.

Supply of Valencias is rapidly decreasing, there now being a little more than 3,000 cars. It is anticipated that the cleanup will be made soon after the first of November. Soon after that date Navels will begin going forward. F. o. b. quotations are now around $4 to $4.50, while delivered prices sometimes reach $7.

A streak of warm weather in the East has cleaned up and given boost to the lemon market. F. o. b. quotations are now standing around $6. The supply of foreigns is lower than usual, reaching a little more than 13,000 boxes on piers or in sight.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 37,630 cars; lemons, 10,737; total, 48,367. To same date last season: Oranges, 28,783; lemons, 7,676; total, 36,459. From Central California to date this season: Oranges, 6,649; lemons, 212; total, 6,861. To same date last season: Oranges, 5,381; lemons, 289; total 5,670. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 23; total, 284.

POULTRY PRODUCERS OF CENTRAL CALIFORNIA MARKET LETTER

You have been advised that your association contemplated shipments direct to London via the Canal. There are now two large consignments of sterilized eggs en route to London, and as great care was exercised in preparing the shipments we feel confident that they will be favorably received in that great market. Foreign exchange rates have been very irregular of late and at the present time Sterling is considerably lower than when our shipments were arranged for. We hope, however, that a more stable condition will be reached before our eggs are actually sold. Your general manager has sailed from Montreal and upon his arrival in London will personally investigate the British markets and will dispose of the eggs we have on the way. He will also attend the World's Poultry Congress at The Hague, concerning which you have already been advised.

The spell of hot weather that prevailed at intervals during the last month had its effect upon the quality of eggs produced. It is reported that many Pacific Coast eggs arriving in the New York market did not command the usual premium, due to the fact that their quality was not up to standard. On the whole, our shipments to New York at the present time are showing fairly satisfactory returns.

On Monday, August 22, we shipped a cargo of eggs to New York via the Canal, on the steamer Henry S. Grove. Owing to the fact that all refrigerator space had been chartered by fruit growers of Southern California, this is the first shipment we have made since our initial, experimental shipment which proved so entirely satisfactory. Nothing preventing, we will make at least one shipment per month over this route for the balance of the year.

We are pleased to announce to our members that we are now able to reduce the price of cases, and beginning with your next returns cases will be billed to you at 50 cents each instead of 55 cents as heretofore. This reduction will not apply to cases delivered prior to August 18.

The tariff matter is now before the senate finance committee and we are informed by Knox Boude, who is still in Washington, that every effort will be made to have the rates on eggs and egg products increased to an amount that will afford us real protection.—John Lawler, Assistant Manager.

CALIFORNIA CATTLEMEN'S ASSOCIATION REPORT

San Francisco, September 10: Sales are reported in Central California for 6c for steers, f. o. b. ranch, and for 5½ for steers f. o. b. ranch in northern counties. It has been reported that a Los Angeles buyer has contracted beet top steers at 7½c f. o. b. packing house. Cattle seem to be in good demand, a large number of buyers being in the field and exceedingly active in buying stock. Nevada cattle are somewhat earlier than usual this year, and it is expected that both Nevada and Utah grass cattle will be completely marketed before November 1. Northern California grass cattle should, if possible, be held until November, in order to avoid going onto the market in competition with Nevada and Utah cattle. The price being paid for cattle in California continues higher in proportion than prices at Eastern points. A very strong feeder market has developed on the Coast, with very few feeders available. Fred H. Bixby sold one car of fat cows locally (Long Beach) on September 3, f. o. b. ranch at 6c, with a 3 per cent shrink. Report all sales of cattle and feeder cattle available to the secretary of the California Cattlemen's Association. Do not sell on consignment. Make all sales f. o. b. ranch. Offer only fat cattle for sale.

Walnut Growers Meet

By Ernest Braunton

THE California Walnut Growers Association meet in the mammoth packing house at Puente on September 16 was the largest, most enthusiastic, most profitable, of any yet held. The attendance was far over a thousand and Secretary Hotchkiss counted more than 500 automobiles on the grounds.

The most important and outstanding feature of the forenoon's program was the discussion of the mysterious "foot rot" or "heart failure," and so prevalent is it becoming in some sections that walnut growers from as far away as Contra Costa County were there to learn, if possible, of remedial measures. The outcome of the discussion was the memorializing of the state college of agriculture to appoint a scientist to study the disease and outline some treatment looking to its control. It was fairly well proven that the Southern California native rootstock is more susceptible to the disease than the northern.

The three big things of the later program were the talks of C. C. Teague, Carlyle Thorpe and Prof. J. W. Nelson. President Teague discussed the importance of the tariff and stated the average grower is too indifferent to the necessity of protection to the industry. Competition is becoming stronger each year and foreign nuts of excelllent quality may be landed at a price lower than the home grower can produce them under present conditions. We have also reached the "saturation" point in production and must study the situation keenly and act quickly and effectively whenever occasion demands if we are to hold our present enviable reputation in the walnut industry.

Manager Thorpe reported on the phenomenal success of the new selling campaign carried out during the season just closed. The association has been shipping and storing in eastern warehouses and supplying the needs of customers daily instead of requiring purchases of practically a month's supply as heretofore. It has proven a big success. One other successful development that will be of lasting benefit was the selling through the big department stores in every large city from coast to coast. Special stress was laid on the necessity for careful grading and sorting of the coming crop. Nuts promise to be small and of but fair quality so selection must be strict, for Chile and China are both prepared to send in nuts which this year are larger and finer and can be landed in the United States for 17 or 18 cents a pound.

Prof. J. W. Nelson, of the state college of agriculture, gave an entirely new talk on soils, illustrated with charts having special application to walnut orchards. His topic was the relation of root distribution to irrigation. Water must be placed where the roots are or they will receive none. Do not store your soil full of water with the expectation that this supply or reservoir may be drawn on when needed through capillary attraction. Water once below the root zone will remain there or go deeper; it obeys the law of gravitation and never comes up.

"State Market Day" Conference

By A. P. Messenger

Members of farmers cooperative associations were entertained at a luncheon given by the California Development Association at the Palace Hotel, San Francisco, September 15.

Chairman Harry S. Maddox, state market director, called attention to the fact that the farmer's crying need was closer producer-consumer cooperation. He cited a case of observing watermelons in Turlock selling to middlemen at the ruinous price of $3 per ton. Upon investigation in San Francisco the next day he found those same melons retailing at $50 to $80 per ton. The freight rate is less than $3, a case of playing both ends and working the middle. Mr. Maddox appealed to the farmers free market with the result that watermelons were retailed at $20 per ton and the producer received between $6 and $7.

President Frank T. Swett of the California Pear Growers Association insisted on the value of cooperative advertising of perishable products. Last year the pear growers were confronted with an overproduction of fresh fruit unless the consumer could be reached by an advance advertising campaign. Skeptics claimed that a perishable fruit crop which lasted only a month or six weeks at best could not be advertised efficiently. The Pear Growers Association set aside $15,000 for advertising purposes. Boston and Philadelphia were selected as trial cities. Attractive, catchy posters and window cards portraying the luscious pear were displayed conspicuously in hundreds of stores in the two cities, preceded by newspaper advertising. The association directors figured that their efforts would be repaid if they could raise the consumption of the fruit 25 to 35 per cent, but the end of the season showed a gain of over 100 per cent in Boston and 200 in Philadelphia.

President Sheehan of the California Grape Growers Exchange spoke on the prosperity of the wine grape growers. Mr. Sheehan stated that wine grape men were in a unique position in that their product was in such demand that they needed no advertising.

Other cooperators present were Manager Tucker, California Almond Growers Exchange; Director Alexander, California Prune and Apricot Growers; President Inman, Pacific Rice Growers Association; Director Virden, California Fruit Exchange, and Geo. H. Hecke, director state department of agriculture.

APRICOT BROWN ROT

According to a recent report based on thorough investigation, apricot brown rot has increased rapidly in California during the past five or six years, especially in the central bay region and the costal valleys. This disease does its chief damage in this region by attacking the flower clusters, then quickly killing the fruit spurs, and sometimes spreading to the wood, usually not over two years old. The disease may attack apricots and prunes when fully grown or nearly ripe. The chief protection, locally, against this disease in the dryness of June and early July. Peaches are protected in the same way during July and August, particularly in the interior valleys. Cold, wet weather at blooming time favors attack, as does also lowness of situation with attendant likelihood of frost injury.

As the result of trials with 17 or 18 different spray treatments at the deciduous fruit station established in January, 1920, by the University of California at Mountain View in the Santa Clara Valley, it is believed that a single winter spraying with lime-sulphur at winter strength, that is, one gallon of lime sulphur to nine gallons of water, will control the disease, if given just as the trees are coming into bloom. Dry lime-sulphur, 12 pounds in 50 gallons of water, also gives good desults.. Bordeaux mixture at 4:5:50 was also effective. Other protective measures are briefly discussed.

SOIL PESTS

It has been shown that eel worms or nematodes, wire worms, potato scab, etc. may be largely brought under control by the application of 220 pounds to 330 pounds of agricultural sulphur per acre thorougly mixed with the soil before planting.

Seed and bulb growers and potato growers have used this treatment for years and lately reported the same since sulphur has been brought to the front as almost a universal cure for many pernicious micro-organisms.

The olive tree was introduced into the Argentine at the time of the conquest; it found there such favorable conditions and propagated there so rapidly that the Spanish government, fearing competition with the mother country, ordered the destruction of all olive trees in the New World. At Arauco (Rioja) there is an ancient olive tree measuring 43 feet in girth; this giant is one of the few trees that escaped destruction, and it is certainly the parent of the olives in the whole of that region.

SPERRY
Standard Recipes

NOTE: *All measurements are level. Flour is sifted once before measuring. A half-pint measuring cup is used.*

Sperry Baking Powder Biscuits

2 cups Sperry Drifted Snow Flour; 1 teaspoon salt; 4 teaspoons baking powder; 2 tablespoons shortening; ¾ cup milk or equal parts of milk and water.

Mix and sift dry ingredients; rub in shortening; gradually add liquid, mixing with a knife to a soft dough. Toss on a floured board, pat or roll lightly to one-half inch in thickness, cut with biscuit cutter, place in pan, brush over top with melted shortening or milk. Bake in hot oven twelve to fifteen minutes.

Sperry Doughnuts

2 cups Sperry Drifted Snow Flour; 2 teaspoons baking powder; ½ teaspoon salt; ¼ teaspoon nutmeg; 2 tablespoons butter; ½ cup sugar; 1 egg; ½ cup milk.

Cream butter, add sugar and well-beaten egg. Sift all dry ingredients and add alternately with the milk. Turn on a floured board, roll out half an inch thick and cut with a doughnut cutter. Allow to stand a few minutes to stiffen the dough, then fry in hot fat until a golden brown; drain on paper, dredge with powdered sugar.

Sperry Quick Cake

2 eggs; 1 cup sugar; 2 cups Sperry Drifted Snow Flour; 2 teaspoons baking powder; ½ cup milk or water; ⅓ cup melted shortening; 1 teaspoon vanilla; 1 teaspoon lemon.

Sift all dry ingredients; beat eggs until very light, add sugar gradually, beating with egg beater. When creamy, add dry ingredients alternately with liquid, mixing well. Add flavoring and melted shortening. Bake in two layers and put together with jelly or add one-fourth cup chopped walnuts and bake in well-greased muffin pans.

Sperry Drop Cookies

¼ cup butter; ½ cup sugar; 2 eggs; 1 cup Sperry Drifted Snow Flour; 1 teaspoon each lemon and vanilla.

Cream butter, add sugar gradually, beating thoroughly; then add one egg unbeaten, mixing until batter is smooth; add one-half cup of Sperry Drifted Snow Flour; beat well, then one egg and continue beating; add remaining flour and flavoring. Drop with teaspoon on greased baking sheet about 3 inches apart, as these cookies spread while baking.

Sperry One Egg Chocolate Cake

First Part: 2 squares unsweetened chocolate melted; ⅓ cup sugar; ⅓ cup milk. *Second Part*: ⅓ cup shortening; 1⅓ cups sugar; 1 egg; ⅔ cup milk; 2 cups Sperry Drifted Snow Flour; 3 teaspoons baking powder; 1 teaspoon vanilla.

Melt chocolate over hot water, then add sugar and milk and cook until thick and smooth. Set aside to cool slightly. Cream shortening, add one cup of sugar, gradually mixing well. Beat egg, add remaining one-third cup of sugar and combine mixtures; when well mixed add flour, sifted with baking powder and milk alternately, beating well. Add flavoring and the chocolate mixture. Pour in well-greased layer-cake pans and bake about fifteen minutes in a moderate oven. This mixture may also be baked in a loaf cake.

BEFORE a recipe can take its place in the ranks of Sperry Standard Recipes it must have proved itself in the making—not once, but countless times. The recipes at the left are taken at random from the Sperry Cook Book. This book has been of immeasureable help to thousands of women up and down the Pacific Coast. Not only are these Sperry Standard Recipes of practical everyday value but they provide foundation formulas that the ingenious housewife can adapt in a host of delicious, economical ways. We'll gladly send this Cook Book on request. Address Domestic Science Dept., Sperry Flour Co., Los Angeles.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The Red Cross of Peace "in the service of those who suffer" is about to begin its fifth roll call in which it is hoped that all former members will answer "Here" and, further, it is hoped that each answer will be accompanied by one big round dollar to continue the membership another year. Detailed preparation for the membership campaign is being worked out at the national convention to be held in Columbus next week. Every chapter in California will have pride in maintaining its war time strength in membership.

COOPERATIVE CANNING

Californians have learned quite effectively the lesson of cooperation. To a certain extent it is becoming common in almost every line of production. Cooperating in canning of our fruits is perhaps the slowest in full realization. We have cooperative canneries built with growers' money which have cost above a quarter of a million. To one of these organizations of growers the war finance corporation made offer of financial help in order that this season's pack might be completed, to the extent of $2,000,000. Therefore, with cooperative canning we are not novices. However, the greater portion of our canned fruits are put up by independent canneries, or a large organization of canneries which largely dominates the canning business of the state. The situation has been such that cling peach growers in the Sacramento Valley have organized the California Canning Peach Growers. Manager M. D. McLeod of that association has been making a thorough study of the California canning situation. He writes:

"The fruit canning business of California is a big proposition, too large in fact for any individual or for any small group of growers from any one section of the state to look at from a distance and say, 'Let's get in and improve the condition.' Cooperative canning is no doubt the necessary balance wheel between the grower and the packer, but it must be handled under the protection of a state organization of cling peach growers which will stabilize the price of fruit to 'all canners alike'; otherwise what assurance have we that there will not be a 'fight,' in which case we have only to ask, 'Where would the balance of power be without a state association behind the cooperative canners? The independent canneries of California run into the hundreds, and half a dozen growers canneries would obviously be lost.'

"There seems to be only one way to control the situation with amity toward all, and that way is for the growers to can, under the protection of the California Canning Peach Growers, as much of their fruit as is necessary to save them from loss, thereby creating a healthy competition which is so necessary to the success of every line of commercial enterprise.

"This condition will not interfere with the development of the present day packers nor should the growers wish to so interfere as it has taken years of advertising California fruits throughout the world and years of distribution to build the industry to its present state of efficiency. Of course growers know that they have helped pay for these institutions, indirectly, it is true, but nevertheless they have helped, and therefore it must be considered that every grower has an investment, and probably a considerable investment, in the canning business, and if he goes out to destroy that industry by duplicating the entire canning capacity of the state with cooperative canneries, is he not doubling his invested money and absolutely destroying the first investment?

"We must consider the prosperity of the state of California as a whole, for in doing so we prosper, every one in it. The solution of this thought lies in the belief that since many growers in the state are not financially able to take on the extra load of erecting or leasing canneries, there should be a state growers association controlling a majority of the fruit of any one variety, the greater the majority the better. This association can then place a price upon the fruit 'to all alike,' thereby eliminating greatly the possibility of speculation and assuring the grower a fair profit whether he cans his own produce or not. Growers must see the necessity, however, of operating this cooperative canning movement as a branch or at least in conjunction with the state growers association and not as a business venture which would place it in the light of an independent cannery.

"There are two sides to every story, however, and the enormous present day investments of the independent canners deserve proper consideration. Growers should not hold the thought of destruction but should place themselves in a position that will command the respect and consideration due from one industry to another. The 'California Canning Peach Growers' will establish this condition for the cling peach men through a business like method of handling the fruit which will be appreciated by all branches of the industry, including the independent canners, the exponents of cooperative canning, and the grower who cannot afford to go into the canning business or who doesn't want to, due to other reasons."

We do not think that any effort to evade a "fight" will be successful. There will always be independent packers of our fruits, and the independent has a way of manifesting his independence by buying for the shortest possible price and selling for the longest. The growers may be induced to cooperate in the way suggested by Mr. McLeod, but we do not think the packers ever can be brought to that point. However, it is possible that the cooperative canners handling a hundred or more different fruits would be slow in coming under the direction of an organization growing only one variety.

The position of the grower who "has helped pay for these institutions" is possibly unique, but we fail to see wherein there should be care to preserve that same institution which fails to treat him fairly. At least the grower will not consider that "the prosperity of California" is a sufficient inducement to justify him in building other canneries and supporting them to the end of time. This sounds too much like the refrain of the big interests which are ever singing: "Support us and we will see that the farmer is made prosperous."

"GRABBING"

In the issue of the California Cultivator of July 30, on page 98, under the title of "Grabbing," we referred to the campaign of certain private hydroelectric interests to prevent the city of Los Angeles from "grabbing" water power possibilities of the Colorado River. This campaign was waged rather bitterly in several sections of California to the end that the city was severely criticized for what we believed at the time to be an effort to secure the best interests of all the people. The city appealed to other communities to join with it in the effort to secure through the reclamation service conservation of the water and power going to waste with every year's floods of the Colorado.

Some farm organizations passed resolutions condemning the city for its action. The Cultivator made appeal in effect that "there is nothing to be gained by calling names and scratching and pulling hair. California needs more cooperative spirit, more getting together and working together. That cannot be secured by following the present movement of trying to stop everybody else from getting what we, the people, are refusing to reach forth and take possession of."

Fortunately that appeal and many others like it have been heeded by many of the farmers who have also done some thinking for themselves, and we now note occasional changes of attitude, as indicated by this quotation from the Elsinore Valley Press:

"At the meeting of the directors of the county farm bureau held in Riverside Tuesday, it was voted to rescind resolutions passed at a special meeting held in July which aligned the farm bureau against the city of Los Angeles in the power controversy."

CITRUS LEAGUE ASKS EARLY FREIGHT HEARING

The California Citrus League issues statement that official action has been taken by its board of directors asking the interstate commerce commission to set for prompt hearing the California citrus fruit case.

The rehearing of this case, which was ordered reopened in June by the commission, was postponed pending the results of a conference with the executive traffic officers of the Western lines, a committee of the California Citrus League and a member of the interstate commerce commission which was held in Washington, D. C., on August 5. Following this conference the Western lines proposed a reduction in the blanket rates from $1.92 to $1.68 per cwt. on oranges and $1.66½ to $1.46 per cwt. on lemons, subject to the concurrence of the lines east of Chicago. The California Citrus League has just been advised that the Eastern lines have declined to concur in the rate reductions on oranges and lemons, and according to E. M. Lyon, president of the league, the industry has been forced to ask the commission to formally review the rates now being exacted.

"Since June, 1918," says Mr. Lyon, "the freight charges on oranges have been increased 86 per cent, and on lemons 71 per cent, and in addition extra charges have been made for special services heretofore covered in the freight rate. Efforts to secure relief from these rates which the industry considers unreasonable from every standpoint, have proven unavailing although reductions have been made in the rates on most of the other principal commodities moving from and to the Pacific Coast."

Gill
One-piece Piston Rings
last longer than others

Because: through every process of manufacture they are handled with the utmost consideration and care. They are *individually* cast from a special gray iron that is heated not too hot, nor cooled too cool. They have an unusually *close texture* that cannot be disintegrated by the heat, or stress and strain of piston ring service. They are *all* subjected to a series of exacting tests. They are wrapped in *moisture proof* paper for packing. Precision prevails throughout the Gill plant.

Los Angeles County Fair in San Fernando Valley

By C. B. Messenger

THE outstanding feature of the Los Angeles County Fair held at San Fernando for seven days was the admirable community spirit shown. The San Fernando Valley is not large as valleys, go, though there are within it something less than a dozen little towns each affording a community center for a large number of real producers, and these producers entered into the spirit of that fair to the fullest. Little individual farms, some of them not over five acres in extent, made exhibits of products covering nearly the whole range of agriculture.

In addition to the showing of community spirit by individuals, there was equally admirable cooperation of the different towns. Each, naturally, wanted to be selected as the location for the fair. Naturally, this couldn't be, and when it seemed best that San Fernando should be chosen, every other community joined most heartily in plans and work. San Fernando Valley was wonderfully well represented in livestock and all the other exhibits. In fact, in the livestock exhibits there were magnificent displays not only from the valley but from other sections of the county and from many other counties and even states.

Tractors were not present in the numbers anticipated, but there were many new models, and in addition there was a remarkably fine showing of implements and power farming equipment. The principal tractor exhibit was a still one, though an adjoining field of hundreds of acres was utilized for demonstration purposes.

"A tractor built to stand ten years of hard work" is one of the slogans of the Wizard 4-Pull. This is a 20-35 fitted with a Kroyer 40 horsepower motor. Its ability to grip with all four wheels makes it look as if the claim that it will operate on all soils under all conditions is not far fetched.

The Tioga Tractor Sales Co., of Los Angeles exhibited and demonstrated a 3-4 Tioga tractor 15-27. This tractor has two speeds, four cylinder, four cycle 4½ inch bore with 6 inch stroke.

On Page 355 may be seen an illustration of the Wallis pulling a disk. This tractor is built by the J. I. Case Plow Works. It is a 15-25 with draw bar pull of 2600 pounds maximum or 2,000 pounds constant. It is equipped with Wallis four cylinder, four cycle valve-in-head engine. Its normal revolutions per minute are 850 to 900. Its most striking feature is perhaps the U-shaped boiler plate frame. At first glance it appears this form of frame would prevent easy access to the working parts. They are reached, however, by a series of port holes conveniently spaced. Total weight of the machine is 3560 pounds.

The Cletrac Model F is of a type "to handle every job on the farm." By convenient arrangement this new model may be changed as to height and as to width, this so as to be fitted to cultivation of low crops. By increasing its height and setting wider than normal it may be made to straddle a row of young corn or of cotton and, carrying its high frame cultivator in advance, do most thorough job of cultivation. The method of attaching this cultivator is shown in illustration. This new model weighs only 1820 pounds and in its most compact form is but 80 inches long, 50 inches high by 32 inches wide. This tractor is declared to be self lubricating. The motor is declared to develop 16 horsepower at normal speed of 1330 R. P. M.

The Allwork kerosene tractor was exhibited by the local dealer in connection with the Railsback people of Los Angeles. This tractor is supplied with heavy duty kerosene motor, four cylinders, 4¾ inch bore, 6 inch stroke. It has 28-14 rating at 900 R. P. M. The machine has a wheel base of 75 inches and measures outside of wheel tires 52 inches. Length over all is an even 10 feet with a weight of 4,500 pounds.

Others there were ranging up to the big power machines. One in particular was pointed out as the type used in cheese factories to extract the butter fat from whey. Whey is about the last thing one would think of as containing butter fat, but in large institutions it has been found that several hundred dollars worth of butter fat has been going to the gutter or to the hogs in the form of whey, and these big powerful separators are now taking it out and the cheese factories have an additional profit which is worth considering. These separators were the Sharples exhibited by the Joy-Reams people of Los Angeles.

In addition, the same people exhibited the Willys light, not a "still life" exhibit, but a real working stock model. The gasoline of the little engine was turned into electricity which was held by the storage batteries and in turn operated washing machine, separator or other small household and farm building appliances. A small electric motor was one feature of this exhibit. This rests upon a tripod and is easily picked up and moved from place to place. The farmer is now able to surround himself with all the comforts of the city, if he has the price, and the price is not prohibitive. These electrical lighting equipments may be installed for less than $300 or, if one has large buildings and widely separated lights, as much as $700.

Nor were tractors the only interesting thing in the power and implement tent. Of course there were automobiles, accessories, implements for shallow cultivation and implements for deepest cultivation, and in irrigation supplies, many varieties of pipes, pumps and distributing appliances. It seemed that only capital was necessary in order to equip a genuine little Utopia in the form of a California ranch. A list of the appliances would fill a page; we will refer to only one or two. The first of these is cream separators. We have always been told that a separator was for five, ten or more cows. This time we saw the little baby separator, the simplest little thing ever, that one could almost turn with his little finger, and declared to be just right for two or three goats or one Jersey. This was no plaything but a for-sure working machine. Of course this baby separator was not the only one in the exhibition though it was the one which drew the greatest attention from Madam Wife.

LIVESTOCK

By Jack Klein

The Los Angeles County Fair at San Fernando proved very conclusively that the breeders of livestock in the southern part of the state are looking for the proper place to show what they are doing. Outside of good money and the promise of good accommodations this fair had little to offer at the start, but the breeders are all very enthusiastic over their treatment and the great number of inquiries they had.

Holsteins

The Holstein show was one of the largest ever assembled in this state and numbered over a hundred head. It was the initial showing for Hartsook, the Maxwell Farms and the Santa Monica Dairy Co., but the stock was in the hands of competent men and with three old time National Dairy Show men and a number of well known California show men in the ring with animals of excellent type, the interest was intense. Jack Shillcock, formerly showman for W. W. Marsh and Bob Hager, showed King Segis Pontiac Jannek into grand champion-

King Segis Pontiac Jannek
Grand champion Los Angeles County Fair at San Fernando. Owned by Santa Monica Dairy Co.

ship. This was a great victory for Jannek has been regarded as an untamable bull. The careful handling and training of the Santa Monica Dairy Company given the bull since his purchase at the Jefferies sale has brought out his good nature and he gave no more trouble than a calf. Jannek is a grand bull and it is fine that he can be shown. It is a question whether there is a bull in the state who can defeat this fellow. It was quite a day for the bull, as he was placed grand champion the first time shown and it happened to be his seventh birthday.

In the two year olds Carl Ray's bull was head and shoulders over the other two.

The senior yearlings brought into the ring King Segis Pontiac Aero, owned by Robert N. Clapp of Nuevo and handled by "Barney" Ademock, formerly with Bob Hager, and Sir Ormsby Hengerveld, owned by the Maxwell Farms and handled by Pete

(Continued on Page 355.)

Agricultural News Notes of the Pacific Coast

Northern California

Sonoma County celebrated its pioneer home-coming festival last week.

Placer County fruit growers will meet in convention at Auburn, October 11-12.

An artichoke show is being planned by growers in the Half Moon Bay district.

Alameda County's new farm adviser, Russell Robinson, has taken up his work.

The Ehmann olive mill at Oroville is being made ready for the season's work.

The Glenn County fair, held at Orland last week had an unusually large livestock exhibit.

A six weeks' poultry course was started at the university farm at Davis on Monday, September 26.

The Galt farm bureau calf club exhibited at the state fair, members bringing home a number of prizes.

Farmers' wives of Solano County have petitioned the supervisors to appoint a home demonstration agent.

A dress form demonstration was given recently at Willows, Glenn County, by the university extension.

The farm bureau of Napa County is cooperating with the U. S. biological survey in trapping and shooting coyotes.

One kindergarten class in the Colusa schools reports attendance of 17 Japanese children in a class membership of 40.

Supervisors of Colusa County have approved a number of road grading contracts in various sections of the county.

The Lake center of the Glenn County farm bureau is asking the river section to cooperate in the eradication of star thistle.

A hundred Napa poultrymen visited Petaluma poultry plants last week, spending much time at the laying contest buildings.

The Placer County fruit growers convention will be held the middle of next month, place and exact date to be announced later.

Another rice association is being talked up in Butte County owing to some dissatisfaction with the contract offered by the Pacific Rice Growers.

The marketing exchange of the Mendocino County farm bureau made livestock sales during the month of August which returned to the owners $35,000.

The home extension department of the Sacramento County farm bureau has resumed activities for the fall season. Pickling demonstrations are now in order.

The Lake farm bureau center of Glenn County is interested in forming a cow testing association. Meetings of dairymen were held Sept. 14 and 15 to discuss the matter.

The Sonoma County Cow Testing Association at its recent annual meeting at Santa Rosa elected S. G. Gambonini, manager, and C. B. Wiborg, official tester. The association has 1250 cows on the list.

T. H. Silsbee of the Oak Park center of Tehama County was re-elected president of the county farm bureau at the annual meeting held recently at Courtland Park. 4,000 farmers attended the meeting.

Central California

Raisins are finding a ready market in Japan.

Mariposa County is now beginning to dig its potato crop.

A few cases of anthrax are reported from San Benito County.

Watsonville will hold a big apple show some time next month.

Clovis, Fresno County, is sending out 6 or 7 carloads of fruit daily.

Rice fields in the Claus district of Stanislaus County show binders at work.

Directors of the San Joaquin County farm bureau hold their annual meeting today at Stockton.

Horticultural Commissioner C. C. Collins of Tulare County has announced his resignation.

Farmers of the Hughson section of Stanislaus County are in the midst of a big weed cleanup campaign.

The California Peach Growers, Inc., has twice advanced prices on dried peaches during the last 60 days.

It is announced that the Reedley cannery, which was closed this season, will open to handle the 1922 crop.

Prof. J. W. Nelson will hold a series of six soil moisture demonstrations in San Joaquin County, October 6 and 7.

Green Valley and Corralitos sections of Santa Cruz County report the Bellflower crop 70 to 80 per cent of normal.

Prices on old raisins were advanced by the Associated Raisin Company one-half cent for September-October shipment.

The annual fig institute will be held at Fresno some time in January. It is planned to make a large exhibit of dried fruit.

There is some talk of imposing a quarantine on sweet potatoes brought in from Southern states where sweet potato weevil exists.

Fresno County again won grand prize at the state fair for best and most complete exhibit of products. Kings County came second.

Stanislaus County fig growers met at Ceres recently for a demonstration of fig packing conducted by the Peach and Fig Growers Association.

Farm home department meetings will be held in Kern County at Kern Delta, September 27; Bearsley, 28; Wasco, 29; Edison-Fairfax, 30.

The Claus center of the Stanislaus County farm bureau held its annual farm bureau picnic at Meyers Grove, east of Riverbank, September 18.

The farm home department meetings for October in San Joaquin County will be all day sessions, at which hat making will be demonstrated.

The newly organized Lindsay-Strathmore Pomegranate Association is busy with box making and other shipping preparations. The fruit is nearly ready for harvest.

It will cost $81,000 to stage this year's Fresno district fair, opening Monday, September 26, for one week. However, $35,000 of the budget is for a permanent automobile exhibit building. Of the balance of $46,000, $37,000 will be distributed in premiums and prize money.

Southern California

Ventura County holds its fair the coming week, October 5-9.

A honey warehouse at Rialto was destroyed by fire last week.

Many cattle are being fed on beet tops in the Talbert section of Orange County.

Victor Valley, San Bernardino County, is making carload shipments of apples.

Venturans are now making use of the Santa Susana Grade when going into Los Angeles County.

The Associated Chambers of Commerc of Orange County met at Huntington Beach September 21.

The El Modeno farm center of Orange County had a community dinner at its September 12 meeting.

The Anaheim chamber of commerce has appointed committees to plan for the 1922 Valencia orange show.

The Anaheim Citrus Fruit Association has unanimously voted to increase its capital from $50,000 to $200,000.

Valencia growers of Orange County say they have received a net of $13,000,000 for this year's Valencias.

The Anaheim sugar factory expects to run for 120 days. The average run of Orange County factories was 90 days.

Contractors have been through the bean districts of Orange County lining up bean straw to be baled and sold as fertilizer in orchards.

Many Southern California potato growers are planning to attend the state meeting of potato growers at the University Farm, Davis, October 3-5.

The pure bred calf club of Ventura County has enrolled six boys and one girl and expects to more than double this number. The breed chosen is the Holstein.

One of the most attractive exhibits at the Southern California Fair at Riverside, Oct. 11-16, will be the Indian arts and crafts from the Sherman school.

A special feature of the annual meeting of the Los Angeles County farm bureau at Pomona, September 28, was the inspection of the egg laying contest grounds.

The Orange County Beekeepers Association met at Santa Ana September 17. O. T. Andrews of Ontario gave a talk on the honey situation and cooperation.

Flood protection costs of the Palo Verde joint levee district for the current year amount to $141,344.53. A very small part of this will be paid by Imperial County.

Representatives from the Greenville, Smeltzer and San Joaquin Lima Bean Growers Association of Orange County attended the annual of the state association at Oxnard last week.

R. D. Flaherty has been appointed secretary-manager of the Orange County farm bureau. Mr. Flaherty was formerly executive-manager of the Jackson County, Oregon, farm bureau exchange.

The Lima Bean Growers Association finds general market conditions satisfactory. All old stock has been disposed of and the new beans will be placed on the market at prevailing prices, $5.65-$6.00 a bag f. o. b. California.

The Coast and General

December 13-17 will be farm week at Albany, Oregon.

Malheur County, Oregon, will market 200 carloads of potatoes.

Tomato growers in the Milton district, Oregon, are shipping a 30 carload crop.

Clarke County, Washington, prune growers are receiving packers offers of 8 cents a pound for 30-40's.

Grazing possibilities in the Umatilla national forest will be surveyed by the U. S. forestry bureau.

Cotton in the Salt River Valley of Arizona will compare favorably with the average of the last five years.

The Oregon Wool and Mohair Association has 1600 members, the territory being divided into ten districts.

The annual short course in agriculture at the Washington state college starts January 2, continuing for eight weeks.

Cranberry growers of Pacific County, Washington, are paying for hand picking 20 cents a peck; scooping 50 cents an hour.

October 1 is grange and farm bureau day at the Snohomish County fair held at Granite Falls, Washington, September 29-October 2.

Secretary of War Weeks reports offer from C. E. James of Chattanooga, Tennessee, to take over the Muscle Shoal nitrate project in Tennessee.

A combined harvester with more than 1500 sacks of wheat were destroyed recently by smut explosion on a ranch near Walla Walla, Washington.

C. L. Hawley, state dairy and food commissioner of Oregon, will be a member of a committee of 11 on dairy marketing of the American Farm Bureau.

Heavy rains on the stock ranges in Arizona have assured abundance of well cured winter pasture. Quantities of wild hay have already been cut and stacked.

Grape growers of Arizona held a well attended meeting at Phoenix the first of the month to study working methods of the California Associated Raisin Company.

Potato Expert Zundel from the Washington state college has been giving demonstrations in Yakima County on potato diseases and better methods of cultivation.

Since the Spokane branch of the federal farm land bank resumed business May 1 it has loaned to farmers of Washington, Oregon, Idaho and Montana three and a half million dollars.

President Howard of the American Farm Bureau Federation has announced appointment of the farmers fruit marketing committee of 1921. Among them are J. E. Johnson, Grand Junction, Colorado; W. B. Armstrong, Yakima, Washington; C. I. Lewis, Salem, Oregon; Sheridan W. Baker, Santa Rosa, and R. B. Peters, Devore.

The woman's auxiliary of the Snohomish County, Washington, fair association is proud of the new building secured by its efforts on the county fair grounds. In addition to extensive exhibits in this building there is planned a comprehensive program of lectures and demonstrations on nutrition, child welfare, home gardens and other topics of interest to home makers.

Raisin Curing Scenes in Central California

Left: A battery of sulphur houses. Dipping vats in building at right. Center: sulphur bleached raisins drying and in the stack. Right: One of the largest dry yards in the state. About 700 tons of soda dipped and sulphur bleached raisins are dried in this yard each year. Eager Vineyard near Marysville.

Making Quality Raisins

By Fred K. Howard

SUPREME quality, speaking of Muscat raisins, is the Imperial Cluster. This is a hand sorted layer raisin, and those produced in certain districts of California cannot be equaled by any other raisins in the world. To produce Imperial Clusters, the grower must be blessed with ideal soil, just the right irrigation, and the right kind of drying weather. He must also know how to cure raisins and how to properly make hand sorted layers.

What Are Hand Sorted Layers?

The term, "hand sorted layers," is in a measure self explanatory but may well be elaborated upon here. Only the vineyards which have a good crop of large berries and bunches should be considered when making these fancy raisins. They are picked with great care to prevent bruising the berries or detaching them from the stem, and dried in the usual way except that they are allowed to cure in the stack more than is desirable for the ordinary raisin. That is, they are not allowed to remain in the sun as long as other raisins and go through a process which is known as stack curing. This method requires more time and skill on the part of the vineyardist but has the desired effect on the raisin. After they are properly cured the grower takes each tray and carefully selects the very finest bunches or clusters and places them in the sweat box which has first been lined with paper. After each layer has been placed in the box another paper is placed on them to keep the fruit from becoming jumbled together. The layers are delivered to the packing houses in this manner. Right here a novice may be thinking that this is a lot of extra work if he does not receive more money for his product. He does receive more money—this is the way it works out. If a grower thinks he has the sort of fruit which will make good layers he can enter into an agreement with the Associated Raisin Company, provided, of course he is already a member of that organization, to make layers. In this agreement the company agrees to pay on delivery $15 per ton, which covers the cost of making the layers. In addition to this the grower is entitled to an additional $10 per ton on delivery as a premium for delivering Extra Standard raisins. Further than this they can be delivered with about a ten per cent higher moisture content than ordinary raisins, which amounts to considerable, and in addition they are treated as though a separate variety, and the proceeds are pro rated among the growers delivering these goods on the basis of grades packed out. It certainly pays to produce good raisins.

Soda Dipped Raisins

There was a time when soda dipped or lye dipped raisins were considered superior in quality to the natural product, but that time is rapidly passing. Still there is a very legitimate reason for producing this class of raisins as well as the so-called sulphur bleached raisin. Certain districts are not favored with ideal drying conditions in the fall as the rains may come a little earlier or the nights be damp, so it is necessary to do something which will hasten the drying time. This is done by dipping the fresh grapes in a hot alkaline bath which very slightly cracks the skin. They are then thoroughly rinsed in clean, fresh water and placed on trays to be dried. The drying process is essentially the same as with the natural raisin except that instead of drying in the vineyard rows they are placed in large dry yards, which permits ease of handling and more ready access in case of rain. Thompsons are about the only grapes treated in this manner in California. In the past, as we have mentioned above, these raisins were considered superior, possibly because most of the imported raisins are treated in this manner, and it has taken the consumers of the world some time to become accustomed to the California natural raisin. At the present time it is very difficult to find markets for even the comparatively small tonnage produced in California at a price which will pay the grower for the extra effort of dipping. At present it appears that the grower who is so unfavorably situated as to find it necessary to dip his raisins is really operating under a handicap.

Sulphur Bleaching

The use of sulphur for bleaching is another trick which was given us by the old country raisin growers, and one which is also gradually going out of style in California. This is largely because of the limited demand for this sort. Sulphur bleaching is accomplished by submitting the soda dipped grapes to the fumes of burning sulphur before drying. To make a good grade of sulphur bleached raisins it is absolutely essential that the grapes be uniformly ripe. Bleaching is one of the quickest ways of telling real quality in raisins. If the sugar is not actually in the grapes when picked they will show up as off-color fruit when the drying is completed. This immediately throws the delivery into a lower grade and the grower loses money. Sulphur bleached raisins will carry through rainy or foggy weather during the drying period better than will any other class of raisin, probably due to the presence of sulphur on the fruit, which is of course a fungicide and probably prevents the development of molds. After the visit to the sulphur house the curing of this sort of raisins is the same as for soda dipped.

In general it may be said that a grower should not attempt to dip or bleach his raisins if it is possible to dry them naturally. While in the past a little better price has been paid for this class of goods the differential is rapidly growing less and will very shortly disappear. There is, of course, considerable expense attached to making this sort of raisins and wherever possible this should be saved. Remember that the judge of our fruit, the consumer, has decreed that the extra effort and expense is not justified and that in reality it is not a better product. There is plenty of acreage in districts where dipping and bleaching is necessary to take care of normal consumer demand.

October in the Vegetable Garden

Northern California

By A. R. Gould

WE should be taking a chance were we to predict early rains this season. However, there's nothing like being prepared, and we would advise having all plots cleared of any crops now matured and the ground put into shape for the coming planting season. Have them well trenched with manure. Where necessary apply lime and work into the surface. Remember successful cropping depends on soil preparation largely. When collecting seeds save only those from desirable types. Follow a system of rotation in cropping as far as possible and consult your record book to do this, which by the way is a helpful thing to keep.

Lettuce

Make a sowing of Los Angeles this month in rows very thinly. Thoroughly cultivate those sown previously and keep moist. Have the soil well prepared with manure well rotted, as any such attention will be repaid with crisp heads of lettuce.

Beans

The Broad Windsor may be sown now in rows two to three feet apart. This bean is of excellent flavor and deserves to be more widely grown. It is perfectly hardy. Collect beans of any of the late varieties and store for the winter.

Carrots

If you failed to sow last month for a successional crop sow now Danvers Half Long and French Forcing very thinly. Carrots thrive on a rich sandy soil and require moderate moisture.

Tomatoes

All sound fruits should be collected before the end of the month as they will ripen quickly inside and cold nights will retard development outside.

Peas

Early varieties of these may now be sown and the ground prepared by deep trenching and moderate application of manure. To secure successional supply sowings should be made every three or four weeks. The dwarf types are usually the most popular, but among the tall growing are varieties of excellent quality and as a good early we can recommend Laxton. Dwarf early varieties we advise are Blue Bantam, Little Marvel and Laxtonian. Sow in rows, not too thickly, at least two feet apart to allow proper space for cultivating as they need this frequently and also plenty of moisture during the growing season.

Beets

Those sown last month as advised will require thinning out and to allow space for development they should be left 6 inches apart. Dig all matured roots and store in the cellar for winter use.

Parsnips

Still time to sow this on well prepared ground. Hollow Crown is the best variety. Those sown last month will also need thinning to 6 inches apart.

Swiss Chard

This is an excellent vegetable and is used as spinach and sowing may now be made in rows 2 feet apart. It also makes fine feed for poultry.

Cabbage

Set out strong plants of winter varieties, Savoy and Autumn King, on well prepared ground. They should be planted very firmly 12 inches apart in rows 2 feet apart.

Onions

The ground must be well prepared by trenching with manure for this crop as onions delight in a rich soil. Early varieties may be sown such as Early Pearl, Early Californian Red and White Bermuda. Sow the seed very thinly in rows about 20 inches apart. A surface dressing with soot or wood ashes will be very helpful.

Leeks and Celery

These are both good winter crops and require liberal feeding with liquid manure to bring them to perfection.

Radish

For winter use sow Black Spanish and Rose Winter in rows 18 inches apart on very rich soil.

SERIOUS WALNUT DISEASE

By Ernest Braunton

A FOOT rot, root rot, or crown gall has been affecting walnut trees for many years and has been given all the names herein noted, also "heart failure"; but the latter name is applicable only to the condition of the orchard owner when he suddenly discovers he is seriously injured by the disease. Otherwise the name heart failure should be dropped for the disease does not attack the tree, but the root, or California black stock only.

During the past few years, especially the late three dry ones, the disease has spread at a truly alarming rate in all parts of the state. In company with R. W. Hodgson, farm adviser of Los Angeles County, the writer visited the orchard of Robert H. Neely, president of the Los Angeles County farm bureau, at Covina. In this orchard, up to the close of the day, September 26, nearly 30 trees had the soil dug away from the trunks from one to two feet deep and some of the affected parts chiseled away in examinations. Be it clearly understood that the Persian or so-called English, walnut tree is not affected in the least. Seedling trees in this and other orchards are immune. It is the California native black stock that is diseased and all tissue above the union is immune. It has been thought the dwarf Southern California Juglans Californica is more readily and more fatally affected than the larger growing variety, Hindsii, native to more northerly counties. But this has not yet been clearly proven.

This is what is found. From mere pockets of small size up to the entire stump the wood is dead and rotten, emitting a very disagreeable smell that attracts flies as soon as exposed. The color of the dead tissue is black and the closely surrounding soil is stained black. The texture of the nasty pulpy mass of dead tissue may be likened to a mixture of shredded wood and asphaltum, except it is less sticky and has a strong sickening stench. All sorts of conditions are found in the variance between free stumps and dead stumps. On some, parts of roots and stumps are alive that in others are dead. The points of first attack and progress of the disease vary much and are baffling to the tree doctor.

This is what is being done to the Neely trees by advice of Mr. Hodgson: The soil is dug away down to the lowest part of affected area so the nasty mess will dry out. Doubtless complete drying will kill it. All affected tissue is chiseled away. Then Bordeaux paste is applied and soil is not replaced about the tree. The effects of this treatment will be closely observed. The writer has suggested that in addition dry lime be sprinkled or scattered in the holes and on surface close about the tree. Of course no more irrigating will be done, but rains will come and it is certain that the lime will then prove a valuable amendment to the Bordeaux if this treatment proves efficacious.

The Cultivator will keep in close touch with this orchard and others affected and report progress of disease and effects of any treatments given. One fact is beyond question; it is the most serious disease attacking any kind of orchard trees in this section for a period of many years.

* * *

(Some practical growers insist that this trouble is a virulent case of crown gall, or root knot. That trouble is liable to manifest itself now in the form of decay forming a mass of chocolate or black decaying material around roots just under surface of ground. In Bulletin 218 Prof. Ralph E. Smith raises doubt, however, as to whether these knots are due to the real crown gall organism, bacterium tumefaciens, but in that book the suggestion is made that the only available treatment is as suggested above, "as soon as trouble appears cut out diseased tissue, disinfect with Bordeaux paste and paint over the wound. —Edit.)

The Carpinteria warehouse of the Santa Barbara County Walnut Growers Association is now open for the season's pack.

The Santa Susana grade is now open for traffic.

YUCAIPA APPLE FESTIVAL

The Yucaipa Valley of San Bernardino County will celebrate its apple harvest in a two day festival October 7 and 8. Actual picking figures show real cause for celebration, for the tonnage is proving much heavier than estimated. Forty thousand boxes have already been shipped out of the valley. The Yucaipa Apple Growers Association has started its second grader and will soon have a third in operation. This association expects to handle 40,000 boxes this season; it had sent out 10,000 to date of September 16. This association has secured cold storage in Redlands for about 20,000 boxes.

Regarding the festival the Yucaipa News says: "One of the big features of the apple festival to be given Friday and Saturday, October 7 and 8, will be the competitive display of the finest product of the valley in both box and plate exhibits. While no attempt will be made to put on a big apple show, nevertheless there is so much fruit of exceptional quality this year and so many orchardists think that they have the "finest," an opportunity will be given to meet in open competition and determine just who has grown the best apples."

VENTURA FAIR

The seventh annual Ventura Fair will open at Ventura next Wednesday. Installation of the exhibits is well under way and when the doors open Wednesday, Ventura County looks for the greatest number of visitors in her history for this show is designed to attract homeseekers, those who are versed in the agricultural, horticultural and livestock industries.

In livestock there will be exhibits from all the well known breeders of horses, cattle, sheep, swine, etc. There will be a National Swiss Mondaine pigeon show, a cat show, a California Rhode Island Red show and many other features.

The horse show will be under direction of F. J. Donovan and F. W. Mathieson. Prizes aggregating $3,000 will be awarded. Livestock premiums will amount to $15,000, poultry $5,000, and agricultural $7,000.

At a recent meeting the directors of the Riverside County farm bureau voted to rescind resolutions passed at a special meeting held in July which aligned the farm bureau against the city of Los Angeles in the power controversy.

The public utilities committee of the Orange County farm bureau has received from the railroad commission announcement of big power rate cuts.

VEGETABLE GARDEN FOR OCTOBER IN NORTHERN CALIFORNIA

(Continued from Page 345.)

Strawberries

New plots may still be prepared. Secure strong plants of these as soon as possible to get them established before the rains commence. Plant on ridges and make irrigation trenches. The rows should be 2½ feet apart, and the plants 12 inches.

Raspberries

This plot should be replanted and canes divided. New plots should also be established with varieties St. Regis and Cuthbert. La France is of recent introduction and is an everbearing type. Trench in well decayed manure to get best results.

One Calexico cotton grower sold 3,000 cotton bales recently at 17½ cents.

Southern California

By W. F. Reichard

AT FIRST thought one does not consider October an important month for the vegetable grower—but just a minute—how about the stuff that was planted during the last two months? It all needs atention, irrigating, cultivating, thinning out and so forth.

Then the garden in general needs going over. Clean up the old crops, put into the compost pile all the old dead plants and litter except those which are affected with bugs or fungi; these latter should be burned. Take in your matured crops of winter squash and pumpkins before an early frost blights the exposed parts, store them in a dry, cool place. Sweet potatoes should be dug, for if the vines get frostbitten it affects the tubers by taking much of their flavor away. When digging the potatoes handle them carefully so as not to bruise or scratch. Select perfect potatoes without scratches or bruises for winter storing.

You will need to take the same method of getting your land wet and worked up as described in last month's planting callendar.

Plantings during this month will comprise the more hardy vegetables such as Egyptian beets, half long and French forcing carrots; Winnningstadt and Cannonball cabbage; Snowball cauliflower; Swiss chard; curled endive; chickory; Los Angeles Market lettuce; leek; parsnip; radish; turnip; winter spinach; Laxtonian peas for quick crop and Stratagem or Senator for a little later. In protected foothill sections Canadian and Ventura Wonder beans will be planted. October is the best month to put out garlic and onion sets. Put out plants of cabbage, cauliflower and lettuce, Swiss chard and kale.

On ground that is cleaned up and on which no crop is to be planted this winter scatter a thick layer of barnyard or poultry manure, which will later be worked in.

Southern Arizona

By M. E. Bemis

MORE gardens for the farms and for city and town people should be the rule, and there are plenty of indications that this is the tendency, but it is unfortunately true that high freight rates will temporarily at least discourage large plantings of commercial crops such as lettuce which has become an important shipping crop, and spinach and cabbage, which were beginning to have some very promising aspects as prospective commercial crops.

Unless favorable rulings for lower freight rates are made very shortly, the commercial plantings of lettuce, except for local use, will be small this year. The fact that in southern Arizona can be grown a very superior quality of lettuce should be an encouragement for all who have a plot of ground to plant a succession of this salad which is no longer considered a luxury but a necessity, supplying some of the vitamines that we need.

Lettuce is easily grown, and for the home garden almost any kind of soil will answer if well fertilized. October is a good month to plant, especially for the main crop. At this season of the year there should be little trouble about germination and growth should be rapid. The plants should be thinned when the third leaf shows. Irrigation should be frequent and cultivations follow each irrigation.

Other things that may be planted in October are beets, cabbage seed, cabbage plants, carrots, celery, cauliflower seed and plants, endive, kohlrabi, leeks, onion seed and sets, parsley, parsnips, peas, radishes, salsify, spinach and turnips.

Taking these in their order, the varieties of beets that seem best adapted to Arizona conditions are Crosby's Egyptian, Early Blood Turnip, Early Eclipse and Detroit Red. Swiss chard is splendid for greens and poultry feed. Several poultymen plant one or two rows in the garden for this purpose exclusively. Stock beets are also worth while planting for poultry. Planted now, they will mature in the early spring and furnish a succulent feed for poultry at a time when it is needed.

Early Jersey Wakefield, All Seasons, Sure Head and some other varieties of cabbage do well and are so easily grown that no family need be without them. Seed planted in the ground where they are to grow will be all right for the early part of the month.

Probably as a general thing it will be better to buy the plants and set out.

Carrots are an old stand-by that should be eaten more and that would call for more extensive plantings. Danver's Half Long, Ox Heart, Improved Chantenay and Improved Long Orange are favorites.

Cauliflower seed, like cabbage, should be planted where it is to grow, and rooted plants for transplanting would be preferable. Henderson's Early Snow Ball and Large Pearl are the varieties most recommended.

Endive is a salad which may be grown with little trouble and adds variety to the table. May be planted in beds and transplanted four inches apart in 18 inch rows.

Kohlrabi is another vegetable that adds a little variety although with most people not as popular as cabbage or turnips, both of which it resembles somewhat.

The late varieties of garden peas are best planted now. Yorkshire Hero has long been a favorite with Arizona gardeners, but there are many other varieties that do well. Parsnips should have much the same attention as carrots and are easily raised. Hollow Crown is recommended. Parsley is somewhat hard to make germinate but may be helped along by planting very shallowly and using a light mulch.

Onions of the Bermuda, Crystal White or Australian Brown varieties are splendid for the small gardener. Seed planted now should produce a supply of green onions throughout a good part of the winter and early spring and a crop of dry onions later. Onion sets may be put out if one prefers.

Spinach is one of those vegetables which seem to be especially well adapted to the climate of southern

Arizona. Like lettuce when freight rates will justify there is a field for commercial planters, and considerable shipments have been made during the past few years, proving that eastern markets are ready to take it if it can be had at prices which will justify.

For the home gardener spinach has a place and should not be neglected. The Prickly Seeded Winter is generally preferred.

Radishes and turnips need little mention. Both may be planted continuously until next spring, furnishing the table from November to April.

October in the Ornamental Garden

Southern California

By Ernest Braunton

IN Southern California, though we garden throughout the year, and plant too for that matter, still we have two planting seasons. The first corresponds to the spring planting season of Eastern states, April-May, and the other is peculiarly our own, October-November, when we plant for the rainy season, which east of the Rockies is known as winter.

Autumn Bulbs

By some gardeners October is called the bulb month, especially so if the cool weather and rains come early. "We" will venture a guess that November will be equally good this year. The first to be planted are freesias and Watsonias and some plant these in September. Cyclamen may be next and then the dwarf gladiolus, Bride, Blushing Bride and Peachblow. There is an earlier species, a light yellow, growing wild in South Africa, Gladiolus tristis, which should be grown by all if bulbs can be procured. It has been growing in the writer's garden for 15 years without transplanting the bulbs. Next come the daffodils or narcissus. None are more satisfactory than the large trumpet varieties, Empress and Emperor. Spanish iris may be had in a dozen named varieties, ranging from white through blue to purple and through yellow to the smoky bronze "Thundercloud." Tulips, especially of the late varieties, will do well if planted deep, in free very rich loam and given an abundance of water.

The bulbous anemones give a great crop of blossoms over a considerable range of color, from white to blue and red, but no yellows. Ranunculus, or French buttercups, usually are planted at the same time and are not much unlike the anemones in appearance and requirements, also equally satisfactory, with great color range, and containing fine yellows. Japanese "Easter" and Madonna lilies may be planted now, but put Lilium auratum, the golden banded lily, not less than six inches deep. Put a handful of sharp sand in the hole, set the bulb on it and drop at least one handful of sand on the bulb before covering with soil. This may prevent decay if bulbs are slow to start. It is good practice with all true lilies, for they have loose scaly bulbs. All that class of bulbs known as Dutch or Holland bulbs, which includes the hyacinth, may be planted this month.

Hardy Perennials

These are often referred to as "like our grandmothers used to grow," but their granddaughters have larger and better ones with a far better variety. Foxgloves, columbines, larkspurs, goldenrod, golden glow, Shasta daisy, penstemons, Canterbury bells and other campanulas, including the "blue bell of Scotland" may all be put in at once and good results reasonably assured. Calendulas, cinerarias, lobelias, pansies, "pinks," poppies, primroses (especially Primula malacoides,) petunias and verbenas are other plants to set out now.

Seeds to sow are: Calendula, centurea, coreopsis, columbine, foxglove, forget-me-not, larkspur, hunnemania, lobelia, mignonette, pansy, phlox, penstemon, salpiglossis, scabiosa, snapdragon, stock, sweet pea, and almost any perennial. Some cuttings may also be easily rooted now; begonia, fuchsia, heliotrope, marguerite, etc., but do it at once—a month later will be too cold.

Do not forget in sowing seed to have a plat devoted to California wild flowers.

If rains come lightly prune the roses at once, merely taking out weak wood, crossing branches or thin, congested centers. If you wish fewer and larger blooms, prune and feed heavily.

Get ready for a new lawn if in need of one. Plant hardy evergreen trees and shrubs, especially native Californians. Take note now of what trees and shrubs have passed through the summer without irrigation.

Northern California

By A. R. Gould

THE recent early rains and the cool days remind that the planting season is here. Shrubs may be moved safely now, in fact, it is wise to get them into their new positions before the heavy rains. Make a general survey of your garden for any change you may wish to make.

When planting shrubs have the holes well prepared and always much larger than the ball of the shrub.

The lawns will also need attention. A dressing with dried blood and bone will stimulate growth at this time. Roses may be pruned back and the climbers should be tied in. Apply farm yard manure to the roots of these, but it should be well rotted. Other vines such as wistaria, jasmine, tecoma, passiflora, etc., all need attention, and manure will help these. New vines may also be planted now.

Bulbs

For the next two months bulbs of all kinds may be planted, and the sooner the daffodils, narcissus, crocus, hyacinths and freesias are in the better will be the results. We have given a selection of the best from time to time in these notes but a glance at the latest catalog will give full description. Tulips of all types should be ordered now and may be planted later. Narcissus are well adapted for cut flowers and should be planted in quantity.

Liliums

Some of these should be in every border as they are very effective and beautiful. The best are L Henryi, L. longiflorum multiflorum, L. Auratum, L. Pardalinum, Speciosum rubrum and L. tigrinum. They delight in semi-shade and well manured soil.

Gladiolus

These are most valuable as a cut flower and they give color to the border. There are a number of named varieties of very delicate shades but if you would like only one of these do not fail to get Prince of Wales. It's one of the very best we have seen. These should be ordered now and may be planted next month. The Fordhook strain may be raised from seed to flower in a year and seed may be sown now in boxes of fine soil. This strain will produce some choice flowers and is more than interesting to grow.

Sweet Peas

Complete the sowing of winter flowering types of sweet peas this month in well prepared trenches. The best are Fire King, Melody, Songster, Snowflake and Spring Maid.

Flowers for Winter and Spring

Snapdragons, Sweet Williams, pansies, violas, forget-me-nots, wallflowers, winter stocks, etc., should have been transplanted from the seed beds and receive every care. Beds and borders should be prepared this month for the winter flowers.

Ranunculus and Oxalis

For cut flowers ranunculus are hard to beat as they are of beautiful shades and flower early in the spring. Secure bulbs of these now and plant six inches apart. Oxalis are wonderful for borders and may be secured in white, pink, lavender and yellow. Plant 8 inches apart.

KIRKMAN NURSERIES

Established in California in 1888

Reliable Trees and Vines

are essential to the great fruit industries of the Pacific Coast.

Our experience has been gained by 32 years of progression in the nursery and orchard business in California.

Reservations are now being made for future deliveries.

We offer our services in undertaking the planting and care of commercial orchards on large scale.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Delphiniums

This is the most useful perennial of all and is now to be had in almost every shade of blue. There are now a number of choice hybrids. They may be raised from seed to flower the first year, but in the young seedling stage require careful handling as excessive moisture will cause them to damp off very easily. The dwarf type growing 12 inches high is known as Chinensis and may be had in light and dark blue shades. They like a fairly heavy soil, well manured. If cut down immediately after flowering, they will throw up again within a few weeks.

Southern Arizona

By M. E. Bemis

THE list of ornamentals for October is sufficiently lengthy to enable those who so desire to make a selection and still plant quite a variety, a variety that will harmonize and add to the hominess of the home far more than the actual cost in money or in labor. The list includes African daisy, calendula, clarkia, coreopsis, cosmos, daisy, globe amaranth, gaillardia, hollyhock, larkspur, mignonette, nicotiana, nigelia, pansy, petunia, phlox, poppy, scabiosa, stock and sweet pea.

The African daisy is a native of Africa, but is apparently well adapted to southern Arizona and is popular here. The calendula grows about one foot high and is attractive as a border plant. Clarkia grows a little taller, is a profuse flowering plant with white and purple blossoms both single and double. Double daisy and Shasta daisy, like the African, are favorites because easily grown. Hollyhocks planted here in the fall will bloom throughout a large part of the next season. For filling unsightly corners or hiding ugly fences where vines are not wanted, hollyhocks are unequaled. Larkspur and poppies make a pretty combination.

Pansies are a little hard to germinate. Sowing in finely prepared, rather sandy soil, and mulching is a help to germination. Phlox and mignonette are old favorites, that our eastern grandmothers planted in the spring, but that we in this more favored climate may plant in the fall for spring and summer flowering.

Sweet peas are becoming each season more and more of a favorite. They grow readily but respond wonderfully to culture. It is too late to plant the Christmas flowering variety for best results, but the well known Spencer varieties may be planted in October and November.

While the amount of time required to properly prepare the seed bed for flowers is small as compared to the long time that the flowers may be enjoyed, it nevertheless requires considerable effort to get the ground properly fertilized and pulverized, and without this preparation one cannot expect best results.

Flower seeds may be supplemented with bulbs for the October planting, the list comprising hyacinths, tulips, daffodils, Chinese lilies, freesia, Spanish iris, calla lilies, amaryllis, anemones, crocus and ranunculus.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dips for Dried Prunes

Can you tell me what strength or percentage of glycerine solution or indigo solution is used on dried prunes to darken the color—Subscriber, Encinitas.

As a rule prunes are simply dipped in boiling water or a bath of five pounds salt to every 100 gallons of water. Where glycerine is preferred to give additional gloss it is added to the hot water at the rate of one pound to 20 gallons. The principal idea with the hot dip for the cured prune is to kill any insect eggs which may be infesting the fruit. Some add a few pounds of sugar or syrup to the hot water, but this is too expensive. Very satisfactory glossing may be secured by cooking to a pulp a few pounds of cull prunes and adding this to the hot water, making a sort of ripe prune juice. We have never heard of the indigo dip.

Alkali

What is the difference between soda and black alkali? Which is more injurious to alfalfa and is there any remedy?—Subscriber, Los Banos.

Our most injurious alkalies are different forms of sodium. Sometimes it is common salt, or chloride of sodium, sometimes it is white alkali or sulphate of sodium or common Glauber's salt, and again it is black alkali, or carbonate of sodium or common sal soda. The latter is the more injurious, and it is often changed to white alkali and reduced by leaching through very heavy irrigation.

Making a Lawn

Last April I planted a lawn and now I wish some information. How often should it be mowed the first summer? Should the clippings be left on the lawn? What is the best fertilizer to use on it What is the value of cottonseed meal as a lawn fertilizer and also as a fertilizer for fruit trees? Is there any way besides fencing of keeping rabbits from eating my lawn? I cannot catch them in steel traps.—Subscriber, Claremont.

Yes, in order to secure fine lawn the mowing should begin as soon as it is of sufficient height. The clipping should not be as close as on an older lawn. The best fertilizer is thoroughly rotted manure. Be sure that its decay is complete for a vast quantity of weed seed is carried to the soil by the use of fresh stable manure. Cottonseed meal is all right, but one thing in favor of the rotted manure is that it carries a measure of decayed vegetable matter which is of mechanical as well as chemical value to the soil. Dried blood, bone meal and complete commercial fertilizers are all good. The best way to keep out rabbits is to build a fence.

Congressman

I would like to have the 1920 Year Book. Will you please tell me the name of the congressman representing this district?—Subscriber, Woodlake.

H. E. Barbour of Fresno represents the 7th district, which includes Tulare County. Denver S. Church was the representative for the three preceding terms.

Grapes Decaying

I am sending you specimen of Thompson Seedless grapes. They are rotting very badly, some worse than these sent.—Subscriber, Anaheim.

This was referred to Fred K. Howard, who answers: "The grapes referred to were in such poor condition that I could tell absolutely nothing about the cause of the trouble. The only possible impression I could get from the letter and from the specimen is that probably ordinary mildew was the original cause of their going bad."

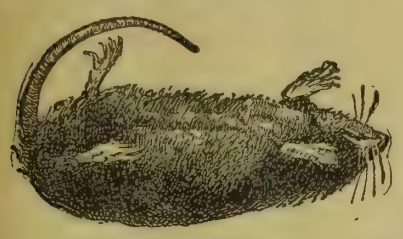
Scale on Orange Trees

I would like to know about scale on orange trees. How do they travel from one tree to another and do they travel all the year round or just during hatching period? In regard to a badly infested orchard one man told me I could not keep my place clean if I spray every month unless my neighbors clean up.—Subscriber, Exeter.

Our inquirer does not mention the kind of scale, but from his location we take it he refers to gray citrus scale, Coccus citricola. These insects reach maturity in April and May, when egg laying begins. It is sometimes well into July before all hatching is completed. Of course at that time the young are locating on the leaves and tender growth and are easily killed, hence control by fumigation or spraying is generally carried on during months of July and August. In the fall when all are hatched many become more or less resistant and the

WIPE OUT EVERY RAT AND GOPHER

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch — old, young, big and little. A single pair left, in a short time, will produce enough to overrun the place. That's why we say KILL THEM ALL.



Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings and property. They are filthy, dangerous, destructive, disease carriers. Wipe them out—not just one or two at a time—but the entire colony.

Easy to Get Every One

A new scientific discovery, called Imperial Virus, now enables you to rid your place of every rat, mouse and gopher easily, quickly, entirely, without trouble, muss or danger. It is absolutely guaranteed to clean out every one of them.

Not a Poison

Imperial Virus is absolutely harmless to humans, domestic animals, poultry, etc., but is sure death to rodents, and rodents only. Fed to them on bread, grain, etc., it gives them a fatal disease, which they give to others and are all wiped out. Best of all, they die outside, hunting water and air.

You can spread this Virus in your chicken house, around gopher mounds, anywhere, knowing it cannot possibly harm any fowl, dog, cat or other domestic animal.

Get Yours Free

The manufacturers of this amazing Virus are anxious to get immediate distribution everywhere and make this big offer. (Act now or clip this offer for future reference, as it may not appear again.) Send $1.00 (bill, money order, check, etc.) to the Imperial Laboratories, Room 157, 2110 Grand Ave., Kansas City, Mo., and you will receive two regular full sized (double strength) $1.00 packages, postpaid. Use one bottle to rid your own place of these pests. When you see how easy it is, tell a neighbor about it and sell him the extra package, making your own cost you nothing. You will be told also how you can make money by telling your friends about it. You need send no money. If you prefer, simply pay the postman $1.00 and postage when you get the two packages. If you are not satisfied after thirty days your money will be refunded.

V. R. ALLEN

SEAFORD, DELAWARE

Stock for Peach Trees

Would seedlings from Elberta and Crawford peaches make favorable stock for budding Hale peaches?—Subscriber, El Cajon.

The best stock for the peach is usually considered to be from seed secured from a seedling tree. However, in practice it is quite common to secure pits of budded or grafted trees from the dry yard or cannery dump. Some maintain that there is actually no difference in the stocks secured. As to Elberta or Crawford many prefer that type of fruit, and some insist that the seed shall be secured from "strong growing yellow peach trees." However, if the trees are to be planted on a heavy soil the Myrobolan plum is preferred.

Loans to Returned Soldiers

Regarding loan to returned soldiers concerning which the Cultivator has had many inquiries: The last California state legislature of 1921 passed an act providing that there shall be submitted to the voters at the general election in 1922 the proposition to bond the state of California for $10,000,000 to be used for the benefit of the returned service men. There was also a direct appropriation made by the act providing for $2,000,000 emergency fund to care for those in most immediate need until the $10,000,000 becomes available. The funds to be used: 1. For educational purposes, this to all California service men and not for disabled only. 2. Colonization, securing and colonizing lands not now cultivated. 3. Providing loans for farms or homes for service men, these loans to be amortized over a period of 40 years at a rate of four per cent interest. The limit of this loan is $7,000 on a farm with, we believe, $2,000 additional for equipment. The amount on a home for the service man not to exceed $5,000. The applicants for these loans must have at least five per cent in cash of the amount applied for. 4. Bond issue for $10,000,000 to be decided by electors. 5. The enforcement of this act shall be in the hands of a veteran welfare board. This board has already been appointed and we believe is holding meetings in Sacramento at this time. The chairman of the board is Frank H. Nichols, Los Angeles.

Feed for Young Rabbits

What is a good feed for young rabbits after they are weaned? What is the best age to wean rabbits and what should be fed to the mother? How old should the doe of the Gray Flemish Giant be before being bred and how old should the buck be before using him for breeding?—Subscriber, Anaheim.

The feeding of young rabbits begins soon after the doe is bred. Proper feeding of the doe from this time to when the young begin to run about (say at ten days old) will prevent many troubles after weaning. A young rabbit is only a baby and the mother's nurse is a very important factor in its development. One must feed that which is adapted for this purpose. One formula is: Equal parts by weight of ground oats, rolled or flaked oats, calf meal and bran kept before them at all times. Some feed flaked oats alone, some bread dipped in milk and made mealy dry with bran. Any of these, with the rolled barley and good alfalfa hay, should produce good results. Young of proper size and condition should be weaned at six weeks. If litter is large, leave one or two of the smaller ones a few days longer to dry up the doe. Flemish does should not be bred until 10 or 11 months of age, neither should bucks be used before that age. A full reading of a good rabbit book on all these subjects will be of much profit.

BUY NO PEAR TREES

until you consider the money-value of a pear orchard on Usuriensis root-stocks (The Chinese seedling)

The HIGHEST AUTHORITY (Prof. F. C. Reimer of Oregon) declares this root-stock to be the most BLIGHT-RESISTANT known, many individual seedlings proving 100 per cent blight-immune under scientific testing.

Not only does this root endure drouth well, but last winter it was submerged by over-flow for ten weeks in Howard Reed's orchard WITHOUT INJURY. It appears to be as resistant to oak root fungus as other pear stock, and as little attacked by pear aphis as the Jap root. Bartletts worked on it make a perfect union, and grow as vigorously as it is possible for pear trees to grow.

After observing this species critically for five years, we consider it the

Best Pear Root-Stock in Existence

For the first time, we can this season furnish a few thousand branch-budded Bartletts, with roots, trunk, and main-limb crotches of this species. Price, $125 per hundred. Also Bartletts budded in the usual manner but on Usuriensis roots. Price, $45.00 per hundred. Superb trees.
Usuriensis seedlings, unusually fine, 5 to 7 feet, for immediate orchard planting, to be later top-worked, $35.00 per hundred. The finest young pear orchard in the world—that of Howard Reed Orchard Company, Marysville—has planted 214 acres of our seedlings and will begin top-working this winter.

Our stock is smaller than usual and early orders are advised. We have discontinued the growing of all nursery stock other than pear trees.

MAMMY'S CROON

When de dark has come a-creepin'
And de mournful owl am weepin',
And de honeysuckles wait fo' evenin' dew,
Down my cheeks de tears am rainin'
On de road my eyes am strainin'—
I'se a-honin', honin,' Honey-chile fo' you.

Time to come. De co'n-bread's bakin',
And yo' cream-cake I'se a-makin'—
Oh, my Honey, how they feed you wha' you stay?
To de flowers de dew am comin',
To his mate de owl went strummin',
But my Honey-chile's so fa', so fa' away.

But, my Hon. you suah am comin';
Jest as suah as bees go hummin';
You am comin' wha' my moughty lovin' am.
Wha' de mocking bird am singing,
Wha' de honeysuckle's swinging,
You am comin', comin' Home, my Honey-Lamb.

—Annette Davisson Squire.

AN HOUR AT SAN FERNANDO VALLEY FAIR

By Ruth P. Dougherty

THE hour was so short and the fair so big that you might say it was only an aggravation, that quick look-over. But it wasn't; it was an inspiration. The ride from the southern end of the valley to San Fernando town was an exposition in itself, preparing the visitor for the close-ups under the tents. Thrifty young orchards, up-to-date poultry farms, rose bordered highways, prosperous looking modern homes along the way, then great stacks of alfalfa and groups of silos marking pure bred dairy and stock farms, with the circle of purple hills enclosing an empire—an empire of homes.

With the big tents only a mile away, the Old Mission tempted a brief stop, and a snapshot shows beside the crumbling walls to the north a high power tower—graphic story of the change from the old days of the Franciscans, the Indians and the scattered brown ranches to the today of green fields and orchards, electric lighted highways and prosperous communities brought into being by the great aqueduct whose course those towers follow.

On the Grounds

It was sunset as we reached the gate, but the visitors were still coming. The livestock were being fed and as we walked through the aisles between the horse stalls, lovely sleek heads looked out with as friendly a gaze as though they had not seen our like passing by all day. The cattle had no time to talk, they were busy with supper and the milking, but the goats looked us over like frisky puppies, straws dangling from busy jaws, with more than half an invitation to come play. Most of the swine were fed and snoring, but some of the Hampshires were talking to their boss as he went from pen to pen to rub and pet them and see if all were comfy after the warm day. Maybe pigs is just pigs, but those pigs talked like humans. The rabbits were beauties and the poultry tent full of fine feathers and brisk comment from the birds attending. It would take an indigo grouch to keep its color through that bunch of cheery chatter.

Just a peep at the big tractor and implement tent, for we must see the horticultural exhibit at the other end of the big grounds—and they were magnificently big, in keeping with the big outdoors. The exhibits were described in last week's Cultivator, but of special interest to our household readers were the variety exhibits from individual farms, the best of orchard and garden products fresh and canned for later use. These exhibits were arranged by artists' hands, apparently, for the grouping and coloring filled the eye and it was hard to pass on to the next and the next. Especially effective was the use of the sorghums and gold and vermilon splashed pumpkins and striped crooknecks.

One end of the horticultural tent was given to such a display of flowers and of needlework as would hold any home maker for hours. Wonderful old blue and white counterpanes were there—one 300 years old—ancestral treasures worth more than their weight in gold, and exquisitely pieced quilts and knitted and crocheted counterpanes which made you want to stop and ask the story of each—and what stories they could tell, those old bits of needlework, of the hopes and joys and changing fortunes from their first homes on the Atlantic to our California! Then there was up-to-the-minute needlework in plenty, beautiful things, so many that we despaired of seeing even a small fraction. An adjoining tent was hung with pictures, many paintings typical of California, the purple hills, the sycamores, the eucalyptus; some rare old treasures from the days of Spanish occupation; in all a showing one would wish to stop and study.

As we hurried out to catch our interurban car we heard women's voices, a trained chorus, one more of the community activities of this busy valley.

While we waited for the car a bootblack restored the shine to our dusty boots and to him we volunteered, "Fine show you have here." "Sure," he agreed, "but you ain't going now? Why, the horse show is the best we've got." And it looked as if others thought so, too, for as our train passed the fair gates the crowd was coming a-foot and in autos, the entire family strong.

JERKY RECIPES

Mrs. H. C. Rudolph, Esparto

In answer to the inquiry for way of using jerky, I am sending two.

Soak jerky over night, drain off water and with a sharp knife remove any fat parts or "strings," then grind with the coarse or medium grinder. Make a rich milk gravy and add the ground jerky. Cook slowly a few minutes. Serve with mashed potatoes or on toast.

For stew soak overnight, remove fat parts and simmer slowly until tender. Add vegetables. When done, thicken the juice with flour.

E. S. F., Madera County

In September issue of your magazine I note an inquiry for ways to use jerky. This is the dried flesh of deer or steer, i. e., it may be venison or beef, and is a very satisfactory method of presrving meat, especially in places where dry heat is the order during part at least of the year. Our children all enjoyed it best, I think, when they could nibble and chew it between meals (if they could get it); or, if going away from home some distance and uncertain of hour of return, to put a handful in a pocket to stay the pangs of hunger when needed. This, of course, refers to the home product which we knew to be clean and sterilized, indeed partially cooked or scalded before drying.

Jerky Stew—Soak amount needed overnight in water to cover, first breaking the brittle jerky into small pieces. In morning put on in same water to heat, adding potatoes cut in slices, carrots if liked and generous amount of sliced onion. Cover and simmer till tender, adding piece of chili pepper, salt if needed and cooked or raw tomatoes 20 minutes before serving time. Thicken to taste with flour and butter rubbed to a paste. As with all stews, different vegetables may be added if liked. If the jerky has been cut from young beef the time for cooking will be short. Also, if jerky is not too dry from long keeping a few hours' soaking will be enough. It is nearly time for us to be "jerking" our fall supply.

"Aida," Prescott, Arizona

I am sending the only recipe for jerky I have ever had. We find it fine, so hope your readers will like it.

For one meal take 15 cents worth dried jerky. Put through meat grinder. Have lard heating in frying pan. Put in jerky, keep stirring, brown nicely with two teaspoons flour, then add 1 half pint hot water and the same of milk. This will thicken nicely. Add butter and pepper. Use canned milk if fresh is not available.

A plate scraper of rubber or wood makes dishwashing easier, and keeps the water from becoming greasy.

There is something in being original

Ever since the early 70's Ghirardelli's Ground Chocolate has been acknowledged the *original* ground chocolate—the chocolate of proved purity, the chocolate of certainty. As a food-beverage Ghirardelli's stands alone—in taste, in flavor, in everyday economy. Say "*Gear-ar-delly*" to your grocer and accept no other ☕ Made by D. Ghirardelli Co., San Francisco—since 1852.

HOUSEHOLD QUERIES

Candied Figs

Have been interested in your recipe for candied figs on page 294 of the issue of September 17, but you say the skins must be slit and then that they must not be boiled hard enough to break the skins. Must the skins only be slit once—and that from top to bottom or around the fig and will these if boxed keep to send east at Christmas time?—Subscriber, Escondido.

With a sharp knife cut 3 or 4 tiny slits not more than a half inch long the up and down way of the fig, cutting only through the thin outer skin, not allowing the blade to go through the soft flesh at all or flesh and seed will boil out in syrup. This is merely to let the salt penetrate under skin to take out the strong taste. Mrs. Stone, who gave us this recipe, says that she uses firm, not too ripe, figs that have had little irrigation and are very sweet. Where one uses watery figs, practically no water is needed to make syrup. These adaptations one soon learns on trial. A soft, ripe fig would be difficult to handle and keep whole. Such figs would not need the soaking in salt water. Mrs. Stone packs her figs down in crocks just as they are, sprinkling a little more sugar over them. Tie on paper cover and store in clean, airy place (away from the ants) and they will keep perfectly for Christmas boxes.

Mexican Tamales

Please tell in the household department how to make Mexican tamales with chile peppers, etc.—Subscriber, Crescent City.

Here are two from the "Times Cook Book":

Have a chicken cooked tender in boiling water to cover; remove meat and chop fine; return bones to broth. From fresh corn husks, select a wide leaf of husk for each tamale, or use dry husks steamed until pliable. Remove and discard seeds from a dozen red chile peppers and chop pods very fine; peel 6 large tomatoes and squeeze seeds from them. Mix tomatoes and peppers and let simmer 20 minutes or until well reduced. Stir enough hot chicken liquor into 3 cups corn meal to thoroughly moisten it, then let stand half hour. When everything is ready, mix tomato and pepper with chicken, adding teaspoon or more of salt as needed to season. Salt should also be added to corn meal if broth in which it was mixed had not been seasoned. Put layer corn meal into corn husk and on this put two tablespoons chicken and tomato mixture. Let chicken come nearly to ends of corn meal, and corn meal well up to ends of husks. Keeping husk between fingers and meal, fold meal over chicken, from each side, to inclose chicken completely; roll husks over the whole, turn up ends and tie securely, using narrow strips torn from husks for the purpose. Put tamales on top of bones in chicken broth, taking care that bones keep them well out of broth. Cover closely and let simmer one hour. Serve hot.

Another.—Take piece of lean beef, veal or chicken, about 1½ pounds, and ¾ pound fresh pork, and put on fire with sufficient water to cover, add bay leaf, a little salt, cinnamon and piece of garlic. Let all simmer and when meat has consumed all of water and is tender enough to shred, remove from fire and add about 2 dozen almonds, blanched and halved, and 2 dozen large raisins. Fry all of this, add sufficient water to make consistency of hash, and season with 1½ tablespoons chile powder. Set this aside while making dough part. For the dough add 2 pounds corn meal, some salt and 1 large spoon lard. Scald meal and make into soft dough that can be handled. Put some corn husks on to boil until soft. Remove from water, dry, rub with brush dipped in lard and put a layer of dough on each husk, leaving about 1 inch at each end to fold. In middle of this spread meat mixture and roll up, and fold over each end. Steam for 2½ hours and serve very hot. If meat part be prepared a day before tamales are to be served they will be much riper and finer.

Many cooks for steaming put a few shucks in the bottom of a pot to prevent scorching and pack in the tamales, placing a weight on top. Cover with boiling water, adding one tablespoon each of lard and chile powder.

HINTS FROM HOUSEKEEPERS

Crabapple Jelly—Brown Overalls

I enjoy the household pages of your paper and get many good suggestions from them. Was about to inquire if any reader could tell me how to remove lime from a teakettle when I picked up the copy containing the very thing by using the eucalyptus leaves. Haven't tried it out yet, but hope to do so soon.

When making crabapple jelly, drain off the juice after cooking, cover with water and cook again, pour off juice again and cook the third time if you like, as the juice is not all extracted with two boilings, though I usually have all I want with two. Even when the fruit is plentiful it is an economy if one's time and strength are considered.

Can anyone tell me how to set the color in brown cotton goods? Sometime, somewhere, I read of using copperas but don't remember how it was used. I find the brown canvas overalls so much more serviceable than any others for little boys, though they fade even with the best of care and salt doesn't set the color, so hope someone can tell me of something.—Subscriber, Rumsey.

We know some mothers who keep on hand a stock of common dyes of the colors easily washed out. A little of the powder is dissolved in boiling water, this thinned with as warm water as the hand can bear (add only enough water so colored liquid will cover garment) and the faded garment dipped as in bluing water, then hung, wrong side out, in shady place to dry. Does anyone of our Cultivator readers know of a better way of keeping the brown color?

Preserved Figs

Peel figs, measure, and to each quart add one cup sugar or one-third as much sugar as figs. Let stand one hour, then cook until about half done. Add one lemon sliced, cutting off ends first. Boil down thick, then can like any fruit. Do not use any water. This is fine for filling for cake or cookies. —Mrs. Viola Fitzsimmons, Lodi.

Fig Conserve

2 quarts peeled figs, 2 cups seeded (or seedless) raisins, 2 cups walnut meats (broken but not chopped), 1 quart sugar, citric acid equal to about 10 peas in size, or the juice of three juicy lemons, pinch of salt. Cook figs, raisins and nuts and citric acid (dissolved in a little hot water) for one hour. Then add sugar and a pinch of salt. Cook for 15 minutes more, stirring constantly.—Rachel D. Roest, Burbank.

Pickles

1 dozen medium sized cucumbers, 6 medium sized white onions, 1 pint strong vinegar, 1 cup sugar, 1 teaspoon mustard seed, 1 tablespoon mixed pickling spices. Slice cucumbers and let stand in salt water one hour. Have vinegar and sugar and spices (tied in cloth) hot. Drain cucumbers. Add them and onions sliced, and boil 15 or 20 minutes. Seal in jars or bottles. —Rachel D. Roest.

CONVERSATION

"Jim," she said, as he settled down for a comfortable smoke, "I've got a lot of things I want to talk to you about."

"Good," said her husband. "I'm glad to hear it. Usually you want to talk to me about a lot of things you haven't got."—Cincinnati Enquirer.

Children do not always know what's best for them, but then, neither does anybody else.

A King Segis Pontiac Offering

102 REGISTERED HOLSTEINS 102

SYCAMORE ACRES, Owned by Robt. N. Clapp, Nuevo, Cal.

SELLING AT

Rhoades & Rhoades Sales Pavilion, Hynes, Cal.

Friday, October 21, at 9:30 a.m.

This is without question the greatest offering of the blood of King Segis Pontiac ever made in the west, including high record cows and daughters of such cows, and a wonderful lot of individuals.

20 DAUGHTERS OF KING SEGIS PONTIAC
All young, many out of high record dams of most attractive breeding, and including a number of high class show quality.

31 DAUGHTERS OF PEARL KING SEGIS PONTIAC
Who is by King Segis Pontiac and out of a 37.51 lb. daughter of Pontiac Korndyke that milked 753.9 lbs. in 7 days, second dam a 727.03 lb. yearly record 4 year old daughter of Pearl of the Dairy's Joe De Kol.

13 DAUGHTERS OF KING PONTIAC NETHERLAND SEGIS 3D
The famous young sire formerly at the head of the Rosamaines Rancho herd. He is sired by a grandson of King Segis Pontiac and out of the twice 34 lb. cow Gerben Abbekerk Maid. His daughters in this sale are a wonderful group of young females, with records up to over 30 lbs. butter in 7 days for a 4 year old.

3 DAUGHTERS OF KING SEGIS PONTIAC CHICAGO
Who sold for the then world's record price of $20,000.00 when a calf. He is by King Segis Pontiac and out of the 40 lb. cow Johanna De Kol Van Beers.

7 DAUGHTERS OF PAUL CALAMO KORNDYKE
The great show bull that has many Grand Championships to his credit in the best shows. His daughters in this sale include the famous National Dairy Show winner Nancy Calamo Korndyke.

FOUR 30 TO 34 POUND COWS
Including the great twice 34 lb. cow Gerben Abbekerk Maid, now making a splendid strictly official yearly record in her tenth year.

If you are looking for young cattle with splendid type and rich King Segis breeding, you will find in this offering one of the choicest lots ever sold in California.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED BY DR. HURT, L. A. COUNTY VETERINARIAN, AND SOLD SUBJECT TO 60 DAY RETEST.

TERMS OF SALE: Responsible parties may arrange for credit with the sale managers on the basis of one-third cash, balance in three, six and nine months, with approved notes bearing eight per cent interest. Credit arrangements must be made before sale.

Catalog free on request.

80 Splendid Herefords
AT PUBLIC AUCTION

Beau Blanchard 76th

Harris Standard 2nd

NEVADA HEREFORD RANCH

J. H. Cazier & Sons Co., Wells, Nevada

will make a most attractive offering from their great herd of registered Herefords, affording a remarkable opportunity for selection of real foundation animals, selling at

State Fair Grounds, Sacramento, Cal.
Tuesday, November 1

The offering will include daughters of Beau Blanchard 76th out of Harris Standard 2nd dams; daughters of Harris Standard 2nd bred to Beau Blanchard 76th; and a desirable lot of cows with calves at foot by these great sires.

SEVERAL HIGH CLASS YOUNG BULLS will appear in the sale list, real herd headers.

This combination of breeding provided the sensation in the largest showing of registered Herefords ever made in California, at the last State Fair, winning consistently over animals that had won in some of the best middle west shows, and demonstrating conclusively that this herd is producing a class of cattle qualified to hold their own in any company.

THIS IS A FEDERAL ACCREDITED HERD

TERMS OF SALE: Arrangements may be made with the sale managers, by responsible parties, for payment of one-half cash, balance in six months, with approved notes bearing eight per cent interest.

Catalog of sale free on request.

The Proof
OF THE PUDDING
King Segis Pontiac Jannek
Grand Champion Holstein Friesian Bull

At San Fernando in one of the Strongest Holstein Shows in the West

KING SEGIS PONTIAC JANNEK 161758

At the 1920 Livestock Show at L. A. the ability of King Segis Pontiac Jannek to sire correct type was proved by the remarkable winnings of his offspring, his two year old daughter K. S. P. J. Pet Segis being Grand Champion cow. Now, in 1921, in his initial appearance in a show ring Jannek is declared Grand Champion.

A Grand Champion Cow by a Grand Champion Bull

K. S. P. J. Pet Segis also broke the state milk record for 1, 7 and 30 days, proving that Jannek is the sire of production along with type.

Buy One of His Sons

Santa Monica Dairy Co. **Venice, Cal.**

Our First Exhibition of Holsteins in California
Was Highly Pleasing to Us

In the big fair at San Fernando we showed a herd almost entirely of our own breeding and won:

Junior Champion Bull.	Junior Champion cow.
Reserve Grand Champion Bull.	Reserve Grand Champion cow.
2, Senior Yearling Bull.	Reserve Senior Champion cow.
1, 2 senior bull calves.	1, 2, 2-year-old cow.
2, Junior bull calf.	1, senior yearling.
1, 2, young herd.	4, aged cow.
1, calf herd.	3, 4, get of sire.
2, 3, three best cows in milk	1, produce of dam.

1, cow with association record (all breeds).
1, aged cow in three days' butter fat contest.
1, 2-year-old in three days' butter fat contest.
All breeds competing on the grounds.

MAXWELL FARMS

Hollywood, Cal.

MR. FARMER:—

You are contemplating the purchase of a service bull next year. Why not save 50 per cent of the purchase price by buying a registered Holstein bull calf now. Pay for him next year when he is ready for service.

Sons of SIR VEEMAN KORNDYKE PONTIAC, who has 27 A. R. O. daughters, and of BURR WALKER SADIE VALE, whose seven nearest dams average 29 lbs. of butter in 7 days, included in this offer. Call or write at once.

BURR FARM 26th and Downey Road, Los Angeles
RFD 2 Box 120

LOS ANGELES COUNTY FAIR

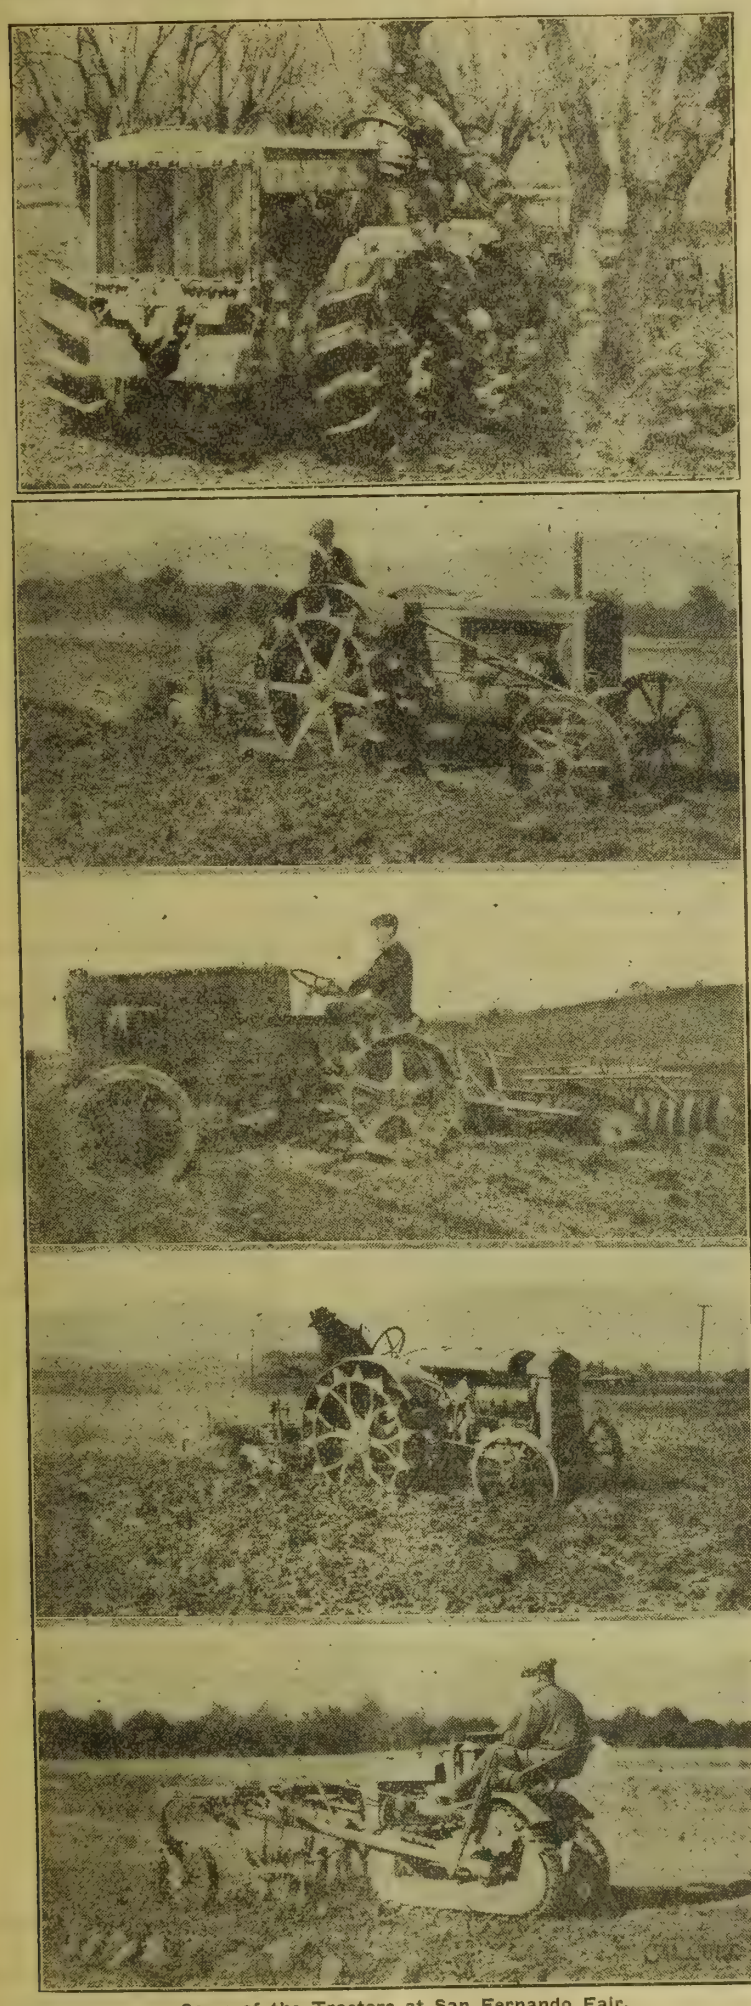
(Continued from Page 343.)

Ledgard, who showed the Maxwell cows into great prominence when their home was at Waterloo, Iowa. The Clapp bull is developing a little more rapidly than his competitor and was given first.

The senior calf class yielded the junior and reserve grand champion in Tritomia Ormsby Pietertje Fayne, owned by the Maxwell Farms.

Twelve grand cows made up the aged class and the first place wavered back and forth between Parthenia Paul Segis 2nd, shown by Earl Sturgis for the Hartsook Ranch, and Segis Walker Gelsche, the grand show cow owned by Clapp. The Hartsook cow was in great bloom and had been fresh recently while the old white cow was dry and heavy with calf who was born later on the show grounds. The Hartsook cow was much better in the head and shoulders, but the Clapp cow has a most wonderful mammary system.

(Continued on Page 358.)



Some of the Tractors at San Fernando Fair.

Upper, Wizard 4-pull, making short turn around tree. This machine can be turned in its own length.

Second from top, Wallis, equipped with Wallis motor, 25-15. Frame is U-shaped Wallis patented boiler plate. Will turn in ten feet.

Third from top, Tioga, 27-15. Tioga patented transmission, positive traction "lays its own track."

Fourth from top, Samson. Its name indicates its strength and it is declared to deliver the goods. "Our success depends upon making the business farmer an equal partner."

The illustration at the bottom is of the first Cletrac Model F. There is no danger of the man on the seat breaking it down though it does appear very small. It is an 1800 pounder. This new model is adjustiable as to height and as to width, is declared to work exceptionally well in cotton, corn, beets and other row crops.

Credit for the Buyer of Registered Cattle

Early this year we announced that we were prepared to handle the credit in public sales of registered cattle managed by us.

During the first six months we handled the entire credit on 10 public sales under our management, and as we are handling the credit in practically all sales managed by us this fall we make this announcement to more fully inform prospective buyers of the plan, which is this:

When a breeder arranges with us to sell his cattle, he may also arrange with us to handle all notes received in settlement, and at the conclusion of his sale we pay him in full for his cattle, deducting only the sale commission and note discount.

In sales of registered dairy cattle we will extend credit on the basis of one-third cash, balance in three equal payments in three, six, and nine months, with notes bearing eight per cent interest.

In sales of registered beef cattle we will extend credit on the basis of one-half cash, balance in six months, with approved notes bearing eight per cent interest.

Arrangements for credit must be made with us before the sale in which such credit is wanted, and we particularly invite applications from those who want to buy small foundation herds.

Bear in mind that in putting this plan in operation we have assumed very large financial responsibilities, and must therefore confine our accommodation to those who are able to show ability to meet their obligations promptly, but we will give just as careful consideration to the man who wants to buy one animal as to the man who wants to buy fifty.

Applications for credit may be made to us by mail, giving us such information as will enable us to pass on the matter intelligently—AND ALWAYS STATING WHETHER OR NOT YOU PRODUCE YOUR OWN FEED—or you may see the sale manager personally the morning of any sale, presenting, if you are an entire stranger, such references as will enable him to pass quickly upon your application.

On the terms outlined above we are handling the credit for the following sales under our management:

HOLSTEINS: Oct. 4, S. O. Walker, Visalia; Oct. 5, Robt. T. Curtis & Son, Tulare; Oct. 6, Alex Whaley, Tulare; Oct. 12, John Saxer, Modesto; Oct. 21, Robt. N. Clapp, Hynes; Oct. 29, F. H. Shanks & Sons, Susanville; Nov. 3, A. W. Morris & Sons Corp., Woodland.

GUERNSEYS: Oct. 20, W. H. Dupee, Santee, selling at Hynes.

HEREFORDS: Nov. 1, J. H. Cazier & Sons Co., Wells, Nev., selling at State Fair Grounds, Sacramento; Oct. 26, part and possibly all of the consignors selling at San Francisco in the Pacific Coast Hereford Cattle Breeders Association sale.

If you have feed and the ability to handle registered cattle do not hesitate to ask for credit. This service was established to aid the breeder, particularly the beginner.

California Breeders Sales and Pedigree Co.

EDGEMOOR FARM

Owned by W. H. Dupee

SANTEE, CAL.

WILL OFFER

51 REGISTERED GUERNSEYS 51

AT PUBLIC AUCTION

Rhoades & Rhoades Sale Pavilion

Hynes, California

Thursday, October 20, at 10 A.M.

THE FEMALES:

There will be 41 females in the sale, all heifers, and practically all are bred. A large number are bred to MASTERPIECE OF EDGEMOOR, one of the greatest young sires of the Guernsey breed, also some to the undefeated show bull DEANIE'S MAROSE OF APPLETREE POINT.

The offering includes granddaughters of Governor of the Chene, Spottswood Daisy Pearl, Rose of Lanwater and a considerable group sired by a double grandson of Governor of the Chene.

These choice heifers should meet with the approval of the many prospective buyers who wish a foundation of young registered Guernsey females of substantial breeding and bred to bulls of unusual merit.

THE BULLS:

The ten bulls in the sale list include a number ready for service, of desirable type and approved breeding, and should find favor with both breeders and dairymen.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO 60 DAY RETEST.

TERMS OF SALE: Cash unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in 3, 6 and 9 months, to responsible parties, with approved note bearing eight per cent interest.

EXTRAORDINARY DISPERSAL

55 REGISTERED HOLSTEINS 55

ELDORADO HERD OWNED BY ALEX. WHALEY

Tulare Sale Pavilion, Tulare, Cal.

Thursday, October 6, at 10 A.M.

This is one of California's choicest herds, and its dispersal affords an unusual opportunity for the purchase of Holsteins of unusual merit, both from the standpoint of splendid breeding and much better than average type, while the fact that only one animal in the entire herd is over 5 years old adds to the general attractiveness of the offering.

20 DAUGHTERS OF SIR AAGGIE DE KOL ACME 2ND

Here is a group of heifers that might well be considered by a breeder looking for a high class foundation herd of females. Their sire is one of the best bred yearly record bulls of the breed, having an average of 1154 lbs. butter in one year for five of his seven nearest dams, while their dams are the best cows in Eldorado Herd, and in addition a considerable number of these heifers are bred to a son of the 34 lb. 4 year old Coloma Beauty Butter Maid, or to King Tola Korndyke Pontiac, the outstanding young son of King Korndyke Pontiac 20th and the 36 lb. cow, K. P. Tola.

A GREAT FAMILY OF FEMALES

The 30 pound cow, Melba Hengerveld, her daughter by Sir Veeman Korndyke Pontiac, and her granddaughter by King Sadie Vale Idyl Segis, all due to calve before December 7 to Sir Aaggie De Kol Acme 2nd, comprise one of the most attractive families of females presented in a California sale.

KING TOLA KORNDYKE PONTIAC SELLS

No matter how high you have set your sights for a herd bull, here is a youngster that you can well offord to consider. He is just now ready for heavy service, and is sired by KING KORNDYKE PONTIAC 20TH, the $12,000.00 son of Miss Valley Mead De Kol Walker, and is out of K. P. Tola, the 36 lb. daughter of King of the Pontiacs that made 33.98 lbs. butter in 7 days at a previous freshening. Study his pedigree in the catalog, and then consider what a great individual he is and you will find an exceedingly rare combination of breeding and type.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

TERMS OF SALE: Cash, unless arrangements for credit are made before sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in three, six and nine months, to responsible parties, with approved note bearing eight per cent interest.

DISPERSAL SALE

70 REGISTERED HOLSTEINS 70

S. O. WALKER HERD
VISALIA, CAL.

Tuesday, October 4, at 10 a.m.

There are bound to be many great bargains in this sale, as the herd is one of especially rich breeding, and a very large percentage of the offering consists of young females or cows just in their prime.

KING OF THE BLACK AND WHITES WILL BE SOLD, and with 47 A. R. O. daughters he now has the largest list of any sire in California. He was the first bull whose 7 nearest dams averaged over 30 lbs. butter in 7 days, and his only two daughters to complete yearly records have shown excellent production.

35 DAUGHTERS OF KING OF THE BLACK AND WHITES, many out of A. R. O. dams with records up to over 30 lbs. butter in 7 days. Most of these are 2 years old or younger and comprise a group that would be attractive in any sale ring in the country.

OFFICIAL RECORD COWS with up to over 26 lbs. butter in 7 days, many in calf to King of the Black and Whites.

MOST OF THE DAUGHTERS OF KING OF THE BLACK AND WHITES are bred to a well bred grandson of Sir Pietertje Ormsby Mercedes.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO TUBERCULIN TEST CERTIFICATES

TERMS OF SALE: Cash, unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will make terms to responsible parties of one-third cash, balance in three equal payments in three, six and nine months, with approved notes bearing eight per cent interest.

HOLSTEIN Fred Hartsook RANCH CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

When Writing Advertisers Mention California Cultivator.

BIONDINI OF HUMBOLT WINS THE CULTIVATOR PRIZE FOR AUGUST

By F. W. Woll

Five grade cows owned by Eugene Biondini of Ferndale had the highest average production of butter fat of similar groups in dairy herds entered in the state dairy cow competition, during the month of August, viz., 71.26 pounds, and the California Cultivator prize for that month was accordingly awarded to him. The production of the individual grades for the month was as follows:

	Age Years	Days in Milk	Milk Lbs.	Butter Fat Per ct.	Butter Fat Lbs.
Midget	6	86	1566	5.5	86.13
Brownie	6	151	1370	5.3	27.61
No. 62	7	92	1181	6.0	70.86
Rosalie	5	146	1014	6.9	69.97
Judy	5	111	1135	5.0	56.75
Average	6	117	1263	5.69	71.26

This is the second time this prize has been awarded to Mr. Biondini; he won it last May for the production of five other grades in his herd. Like the latter grades, the prize winning cows for August are all grade Jerseys and are all mature animals. It will be seen that the production of these grades ranged from 86.13 to 56.75 pounds of butter fat, the average production of milk being 1253 pounds, with an average fat content of 5.69 per cent (average distance from calving at beginning of month, 117 days).

These cows stood first among similar groups of five grades in 21 dairy herds in different parts of the state that competed for the Cultivator prize the past month. The average production of butter fat of all but ten of the groups came above 50 pounds, the lowest producing grades averaging 34.77 pounds.

Five grades owned by the following dairy farmers produced an average of over 50 pounds of fat during the month, viz., E. Biondini, Ferndale, 71.26 pounds; Earl Graham, Compton, 62.93 pounds; N. Hauck, Alton, 62.64 pounds; M. Pontoni, Arcata, 60.37 pounds; F. F. Pellissier, Whittier, 59.06 pounds; J. A. Genzoli, Loleta, 58.04 pounds; P. Iversen, Grizzly Bluff, 57.84 pounds; P. Christen, Waddington, 56.12 pounds; H. L. Wakeham, Santa Ana, 52.99 pounds; Adren Certified Dairy, El Monte, 52.01 pounds; and J. B. Harbers, Waddington, 51.77 pounds.

SWINE AT RIVERSIDE

The swine show at the Southern California Fair at Riverside will show representatives of the Poland Chinas, Duroc-Jerseys, Hampshires and Berkshires running close in the contest for supremacy.

Among the Duroc breeders already entered are J. C. Craig, Owensmouth; J. E. Thorp, Lockeford; George Jr. Republic, Chino; William V. Mong, Whittier; Sierra Vista Stock Ranch, Perris; Charnock Ranch, Hemet; Winsor Ranch, San Diego.

The Poland Chinas will be represented by the Eastman Ranch, San Fernando; R. A. Chapman, Oakmere Ranch, San Diego County; Bucklin Ranch, Fresno; Fred Gatewood, Fresno. A number of local breeders will show in the open classes as well as in the specials.

The Hampshires will be well represented by herds from the Fairbanks Ranch, Redlands; the Llano Vista Ranch, Perris; Francis T. Underhill, Santa Barbara; E. Avery Newson, Lankershim; the H and G Ranch, Solvang; A. B. Buell, Carpinteria; Carl J. Meiners, Ojai.

The Berkshires, too, will come in with a strong showing from all parts of the state. A. B. Humphrey, Escalon; Italian Vineyard Company, Guasti; D. A. Bastanchury, La Habra; George E. Stingle, El Monte; F. L. Hall, Perris; R. N. Hall, San Jacinto; C. T. Johns, Cucamonga, are among the entrants.

In each of the swine breeds there will be special litter futurities, which have filled, and in all these cases there will be additional entries in the open classes.

DISPERSAL SALE

One of Stanislaus County's Choicest Herds
37 Registered Holsteins 37
Owned by JOHN SAXER, MODESTO, CAL.
Wednesday, October 12, at 11 a.m.

The sale will also include 6 head from the good herd of W. A. Walker, Ripon, Calif.

This is an offering of splendid type, substantial breeding, and presented in excellent physical condition. The offering includes

A 31 POUND GRANDDAUGHTER OF KING OF THE PONTIACS, out of a daughter of Sir Skylark Ormsby Hengerveld.

THREE DAUGHTERS OF SIR SKYLARK ORMSBY HENGERVELD, one of the very best sires ever developed in California.

A 2 YEAR OLD DAUGHTER of the great heifer Moorland Colantha Rose, sired by a 32 lb. son of King Mead of Riverside.

TWIN DAUGHTERS OF SEGIS PONTIAC DE KOL DUTCH, the Freeman & Edwards bull whose three nearest dams are all 1000 lb. yearly record cows.

THREE DAUGHTERS OF SIR WITKOP DE KOL, a three-quarter brother to the noted Freeman & Edwards heifer, Belle Faskie De Kol Witkop.

A SPLENDID LOT OF YOUNG COWS, many with good records, and representing most attractive and popular blood lines.

A SON OF MOORLAND COLANTHA ROSE

The sale will also contain a ten months old son of the great heifer, Moorland Colantha Rose, sired by Segis Dutch Ormsby, a 32 lb. son of Segis Pontiac De Kol Dutch. He is a high class individual, and should go to head a good herd of registered females.

Other young bulls of choice breeding, including two sons of the 31 lb. cow, Segis Johanna De Kol of Edelweiss.

Every animal positively guaranteed to be a breeder; every animal over six months old Tuberculin tested and sold subject to retest by the buyer unless otherwise announced at sale.

TERMS OF SALE: Cash, unless arrangements for credit are made before sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in 3, 6, and 9 months, to responsible parties with approved note bearing eight per cent interest.

35 TOP NOTCH HEREFORDS

— AT PUBLIC AUCTION —

California National Livestock Show Grounds

SAN FRANCISCO

Wednesday, October 26, at 1 P.M.

Providing an opportunity right at home to buy Herefords of most approved character and breeding. The cattle for this sale will be selected largely from the show herds of leading breeders in Nevada, Oregon, and California, by a committee representing

Pacific Coast Hereford Cattle Breeders Association

J. I. Cazier, President — J. A. Bunting, Secretary

The wonderful exhibit of young Herefords at this year's California State Fair was a revelation of the amazing progress the breed has made in California during the past few years, a progress that is right now only at its beginning.

Why not lay your foundation in this sale for one of the most useful, most profitable agricultural activities—the breeding of registered Herefords.

Write for circular and catalog of sale.

LOS ANGELES COUNTY FAIR

(Continued from Page 355.)

After much deliberation the Hartsook cow was made first and later grand champion.

The junior champion was the beautiful Maxwell heifer, Lily McKinley Ormsby Skylark, a daughter of the unchallenged world's champion three year old, K. S. P. Lily McKinley.

Earl Sturgis showed a junior calf that was perfection itself and the sweetest thing in the whole show.

In the record cow class the Maxwell entry, Ormsby Buffalo Mercedes, with 928 pounds of butterfat and the highest score on conformation, was easily first over all breeds. De Kol Pet Segis, owned by Hartsook, was second.

In the three day milk contest the Maxwell cows won in both the aged cow and under three year old divisions.

The get of sire class was a humdinger with seven entries. Robert N. Clapp was first with Hartsook and Maxwell fighting for second.

Exhibitors: T. W. Jessup, Glendale; Harvey Frampton, Artesia; Maxwell Farms, Hollywood; Robert M. Clapp, Nuevo; Santa Monica Dairy Co., Venice; Herbert J. McDade, Jr., Pasadena; Sunshine Company, San Fernando; Carl Ray, Lankershim; Fred Hartsook, Lankershim.

Produce of dam—1, Maxwell Farms; 2, Hartsook; 3, Clapp.

The Guernseys

The Guernsey show brought out a big surprise when Prof. Major, after long consideration, made Aristocrat of Windmere, a senior bull calf, grand champion over the great two-year-old Inspiration of Edgemoor, shown by the Adohr Stock Farm. There is no question that the calf is one of the best ever shown on the coast, but the big bull is exceptional also and it was a very hard class to judge. In the minds of the cooler and deeper thinking spectators the decision was right.

It was an excellent show all the way through with fairly large classes. In the aged bulls May King of Fern Ridge, many times grand champion, was first but yielded the senior honors to Inspiration of Edgemoor shown by Adohr Stock Farms.

In the aged cows the grand champion of the state fair, Sylvia of Frankland, shown by D. O. Brant, was first with Princess of Meadowbrook, many times champion, second, and Imp Cherry of the Effards shown by Dr. Wessels of Chino third. This class was easily decided as the second and third cows have calved recently and still carry considerable inflammation. Cherry was slightly lame also. Sylvia was easily senior and grand champion.

Brant showed a large herd and took most of the money.

The Adohr Stock Farm, whose business is principally that of producing certified Guernsey milk, had the distinguished honor of showing milk in the dairy division which scored 100 per cent. This is the first time that milk tested by the men from the United States department of agriculture was ever given a perfect score. Adohr also won 1 and 2 in grade cows with cow testing association records.

Exhibitors: D. O. Brant, Owensmouth; Windmere Farm , Chino ; Adohr Farm, Van Nuys.

Aged bulls—1, Brant on May King of Fern Ridge; 2, Adohr on Rex Harvester of Maple Hill; 3, Brant on Bayberry Barrier.

Two year old—1, Adohr on Inspiration of Edgemoor; 2, Brant on Itchen's Daisy King of Revada; 3, Adohr on Reuben King of Hollow-Hill Farm.

Jr. yearling—1, Windmere Farm on Imp. Man of War of Edgemoor; 2, Brant on May Day of The Rancho; 3, Adohr on Harvester Prime of Adohr; 4, Windmere Farm on Brilliant's May Secret of Edgemoor.

Sr. calf—1, Windmere Farm on Aristocrat of Windmere; 2, Brant on Noble King of The Rancho; 3, Adohr on Sephus of Adohr.

Jr. calf—1, Brant on Golden Glow of The Rancho; 2, Adohr on Adohr Escondido.

Aged cow—1, Brant on Sylvia of Franklin; 2, Brant on Princess of Meadow Brook; 3, Windmere Farm on Imp. Cherry 3rd of Effards; 4, Brant on Golden Glen Pansy.

Two year old;1, Brant on Rose Mary of The Rancho; 2, Brant on Elsie of The Rancho 2nd.

Sr. Yearling—1, Brant on Jeannie of The Rancho; 2, Windmere Farms on Pearl Rose Secret of Revada; 3, Brant on Pet of The Rancho.

Jr. Yearling—1, Brant on Felois Tungsten Priscilla; 2, Windmere Farms on Vampire of Edgemoor; 3, Windmere Farms on Minuet of Edgemoor.

Sr. heifer calf—1, Adohr on Inspiration Prime of Adohr; 2, Brant on Fascination of The Rancho; 3, Windmere Farms on Pearl Rose Golden Heiress of Edgemoor;

Produce of dam—1, Brant; 2, Brant.

Ayrshires

There was only one herd of Ayrshires present, the one shown by A. MacMinn of Phoenix, and all honors went to it.

The Swine

The Duroc-Jerseys were the most numerous in the swine and with the large herds shown by William V. Mong and J. C. Craig having just returned from the state fair they showed the most class.

Mong's state fair grand champion sow, Pathfinder's High Lady, was beaten by his senior yearling sow, Col. Pathfinder's Lady, who was reserve grand champion up north, for senior and grand champion.

The junior champion was a wonderful pig shown by Ward B. Wilson of Lankershim.

In the boars a junior yearling owned by Chas. LeMayne of Lankershim was made grand champion. This boar was sired by Great Sensation 3rd and is out of a daughter of Model Defender Lady, the old sow that won so many championships for Bob Walker. He is a wonderful boar excepting for one wrinkle just behind his shoulders.

In the pigs, Mong's boar, Sensation Bankroll, won again. His litter of pigs was first in young herd, get of sire and product of dam, and won the special trophy awarded by the Duroc-Jersey Association. Mong's aged herd was also first again.

Hampshires

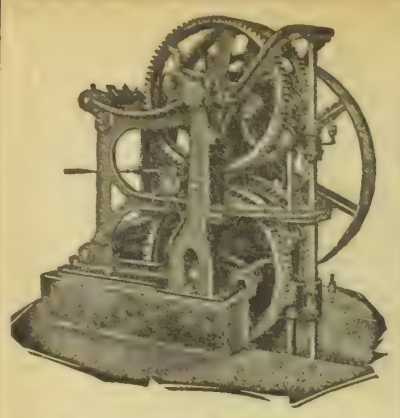
"Lonnie" Buell of Carpinteria came loaded to the Hampshire show and walked away in nearly all classes in which he exhibited. The aged herd shown by Buell could have won in any show on earth, according to the judge. It surely was a beauty with the grand champion boar, O. U. R. Hawkeye Grant and the old sow, Floreine 2nd as its main components.

Floreine 2nd, who was grand champion all around last year, had the honor of being grand champion and mothering the junior champion boar and sow also shown by Buell.

Josh Wilson, a young boy from Pasadena, showed the first prize senior yearling boar. Josh is a coming livestock man and buys, feeds and shows his animals.

Dr. E. Avery Newton was present with a large herd and took many blues as well as placing in all classes.

Citrus growers associations of Orange County are seriously discussing formation of a shipping company to send fruit through the Panama Canal to avoid excessive railroad rates.



THE POMONA

Duplex Plunger Deep Well Pumps

are solving the Pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of Pumping water.

Pomona Pump can be seen in operation at the coming Riverside Fair. Look for our exhibit.

The San Fernando Poultry Show

By Jean A. Koethen

AFTER nearly 12 months without a poultry show in or near Los Angeles (the last was at Exposition Park last October) the show held in connection with the San Fernando Valley fair last week was heartily welcomed by all poultry folks of the south. It was time we knew what the fanciers were doing and no more auspicious time or place could be found than a tent at such a fair. To be sure, it was early for good plumage, and a little too hot for the birds under that big white tent, but all the folks enjoyed it, and there was no livelier spot on the fair grounds and no better exhibit than that in the poultry tent.

This was a good show, not so large as some that have been staged in years past, but a good representative show and well managed by that veteran fancier and poultry show director, E. I. Hammond, of Riverside. Over 600 brids were entered, including bantams, turkeys, ducks and geese. The entries were so thoroughly representative, and from such widely distributed territory that the seeker for good stock of almost any breed had no difficulty in getting a line on what he wanted.

Utility Stock Leads

Maybe some fancier will object to my calling Rhode Island Reds utility stock. Certainly there is no finer bird for the fancier's purpose, but the Red breeds beautifully to type and is also in high esteem as a layer, a mother and a meat breed. In every show of the past few years the R. I. Red has led in numbers and in this show its popularity was overwhelmingly evident, one-fourth of all birds entered being either S. C. or Rose Comb Reds. Of course the single comb birds were greatly in the majority. They always are, but the few Rose Combs were among the best birds shown.

But in speaking of utility breeds leading I had in mind not only the Reds, which were first in number, but the Leghorns, of three different colors, but mainly White, which were such a good second that no other breed came in sight of them. Out of 552 chickens (exclusive of bantams) in the show, 286 were Reds and Leghorns. This is exceptional and significant. The fancier has evidently discovered that if he is to sell his eggs at profitable prices he had better work with breeds that have a reputation as producers. Eggs and fine feathers are not mutually exclusive and some of our finest pure bred hens are also heavy layers.

Unusual Varieties

The Silver Leghorn may not be a new breed, but it is very rare, and the three birds shown attracted much attention. The male is black and white and the female mostly gray with some buff in breast and wing. Then there were more entries of Brown Leghorns than usual, with Light Brown and Dark Brown as carefully and distinctly differentiated as the Light and Dark Brahmas, which were also noticeable for their differences. The Light Brown Leghorn is the bird we are familiar with. The Dark Brown, which I do not remember to have seen before, is much darker, more on the color of the Partridge Rocks and Orpingtons.

Another entry that attracted a good deal of comment was the three roosters from a cross of R. I. Red and Blue Andalusians. They were long-legged, too long for vigor, but of very beautiful coloring, a mixture of red and slaty-gray, or perhaps I should say red on a background of bluish gray. It needed only a few white feathers somewhere to make every passer stand at attention and listen for the strains of "The Star Spangled Banner."

Wyandottes Score

Wyandotte Alley, while shorter than Red or Leghorn Alley, contained some very fine birds. Whites led with 47 birds, but there were specimens of Silver, Partride and Golden. Anconas were a smaller class than usual, only 38 birds being shown, and Light Brahmas had exactly the same representation. Barred and White Rocks are always good classes, but this time the White led, with Buff second and Barred third. Cornish, Buff and Black Minorcas and Sicilian Buttercups were not large classes, but creditable, and there was a sprinkling of R. I. Whites, Sussex, Langshans, Blue Andalusians and Houdans.

Bantams were interesting, as always, and the 82 birds entered included the best known breeds, Buff and Black Cochins, Silver and Golden Sebright, Black and White Rose Comb, Light Brahma and Black Breasted Red Game being among them. Half a dozen Bronze turkeys, a pair of geese, a pair of Runner ducks, and two White African guineas, one with a brood of baby guineas, completed a show worthy the careful study of any one interested in poultry.

POULTRYMAN'S CALENDAR—OCTOBER, THE PULLET MONTH

By October 1 all the pullets should be in the laying house beginning their fall work. The poultryman's first business this month is to make them so comfortable and feed them so well that every pullet with the requisite stamina will do her best. If they have been carefully culled every pullet will be starting without a handicap.

Absolute cleanliness—clean water, clean air, clean nests, clean droppingsboards, clean bodies, clean soil to run on, clean litter to scratch in—is the first esential.

An adequate ration is the second. A laying mash always before the pullets in hoppers; a full feeding of mixed grain at night, or divided between night and morning, with the night feeding heavier; greens twice a day; a light meal of mash moistened with sour milk early in the afternoon; this is the bill of fare that is put on by careful feeders. Not all feed the moist mash in the fall, but many do.

Abundant green feed is the third. Commercial egg production on a skimpy allowance of green is impossible. Alfalfa, kale, barley, chard and mangel beet, all are good, but alfalfa is the stand-by. Half an acre of alfalfa, well irrigated, will feed 2500 hens or more.

HIGH CLASS POULTRY AT STATE FAIR

THE recent exhibit of poultry at the state fair was declared to be one of the best yet staged. The total number of entries was 1,688. 517 of these were pigeons, which was 40 more than any preceding year. There were 323 bantams, 67 ducks, 30 turkeys, 10 geese. The rabbit exhibit was much lighter than preceding years. Judge Robert V. Moore said the crying need of the state fair poultry exhibit was "more room." Double-decking is not satisfactory, and this year's plan of doubling up entries was declared most objectionable. The only way to get in more cages is by spreading. The leaders in exhibits were Orpingtons, Rhode Island Reds and Columbian Wyandottes.

(Continued on Page 363.)

How Can the Farmer Prosper Unless the Railroads Prosper?

THE development and prosperity of farming in the United States have in the past gone hand in hand with the growth and development of the railroads. Ahead of or beside the courageous pioneer has gone the railway.

The railway is dependent on the farmer for the tonnage which enables it to live and conduct its pusiness. Likewise the farmer is dependent on good and adequate service by the railway as the means of getting his products to the markets of this country and the world under conditions which will enable him to prosper.

Railway Development at a Standstill

The development of the railways has been practically at a standstill for some years. No industry can grow unless it can get people to put new capital into it. No industry can get people to invest capital unless it can pay a return on this additional capital.

Stagnation in the railroad industry is a menace to the farmer. The products of the farms are constantly increasing. Without increased means of transportation these increased products of the farms cannot be carried to market.

The Earning Power of the Railroads Was Practically Destroyed During the War

They are now trying to get it back. They want to get it back so they can provide additional locomotives and cars to handle the increase in traffic and provide for the future development of the country. They must raise large amounts of new capital to provide these facilities.

Not Asking Return on "Watered" Stock

Every farmer and business man knows it is impossible at present to borrow large amounts of money for even 6 per cent. How can the railroads be expected to raise new capital for new facilities if they are not allowed to earn at least 6 per cent, which the Interstate Commerce Commission has held they need?

Is this 6 per cent on "watered" stock? No. It is not based on stock at all, or on bonds either. It is based on the minimum value of the property which the railways devote every day to the public service in transportation—tracks, stations, locomotives, cars, shops, and so on. This valuation has been made by the Interstate Commerce Commission under the Valuation Act fathered by Senator LaFollette of Wisconsin eight years ago.

It is not based on what it would cost to rebuild the railroads at present high prices of materials and wages, but **on what it would cost to rebuild them at pre-war wages and prices as they stood in 1914.** A valuation based on present wages and prices would be twice as great.

Some railroads are "overcapitalized." Many, including most of the big systems, are undercapitalized. But neither in the one case nor the other does this affect the basis on which rates are made.

What Regulation Can Not Do

The farmer has just lost a friend and the country a valuable citizen by the death of ex-Judge C. A. Prouty. He was for seventeen years a member of the Interstate Commerce Commission. He was in charge of the valuation of the railroads from the time it was begun until his death. He said:

"We can regulate the railways. We cannot by legislation force one single dollar of private capital into railway investment against its will."

The farmer, by favoring regulations that will help the railways to regain their reasonable earning power, can help them to attract hundreds of millions of dollars needed for rehabilitation and enlargement of railway facilities and for increased and improved transportation service to the farmer.

The further development of the country will be arrested and the farmers and all other classes seriously injured unless the railways are given opportunity to raise the capital needed to enable them to make their service better and more adequate.

Association of Railway Executives

61 BROADWAY NEW YORK — 764 TRANSPORTATION BUILDING CHICAGO, ILL. — MUNSEY BUILDING WASHINGTON, D.C.

Those desiring further information on the railroad situation are requested to address the offices of the Association or the presidents of any of the individual railroads.

A pipe's a pal packed with P. A.!

Seven days out of every week you'll get real smoke joy and real smoke contentment—if you'll get close-up to a jimmy pipe! Buy one and know that for yourself! Packed with cool, delightful, fragrant Prince Albert, a pipe's the greatest treat, the happiest and most appetizing smoke-slant you ever had handed out!

You can chum it with a pipe—and you will—once you know that Prince Albert is free from bite and parch! (Cut out by our exclusive patented process!) Why—every puff of P. A. makes you want two more; every puff hits the bullseye harder and truer than the last! You can't resist such delight at any stage of the game!

Prince Albert is sold in toppy red bags, tidy red tins, handsome pound and half pound tin humidors and in the pound crystal glass humidor with sponge moistener top.

Carrots: Supplies moderate, market steady, per dozen bunches mostly 35@40.

Cauliflower: Supplies moderate, market steady, 2.00@3.00; mostly 2.50@2.75.

Celery: Supplies liberal, movement moderate, market weak. Per crate, mostly 5.00@5.50; poorer, 4.00@4.50.

Corn: Supplies light, movement moderate, market steady. Locals: Per lug, mostly 75@85; fancy, 1.00@1.10.

Cucumbers: Supplies liberal, movement moderate, market steady. Locals: Lugs mostly 50@65; pickles, 1.50@2.25 per lug, according to size and quality.

Eggplant: Supplies liberal, demand moderate, market steady, 5 per lb.

Lettuce: Supplies liberal. Movement good, market steady. Local: Field crates, best 1.00@1.25, poorer 75@85.

Okra: Supplies light, market steady, fancy, small, 9@12 per lb.; poorer, 7@8.

Peas: Supplies light, market firm, best 12@14 lb.; poorer, 10.

Peppers: Supplies heavy, market steady. Locals: Bells mostly 35@40 lug; poorer 30; Chili, 3@4 per lb.; lug best, 35@40; poorer, 25; Red Pimiento, 80@90.

Squash: Supplies moderate, market weaker, summer mostly 50@75 lug; Hubbard, 1½ lb.

Tomatoes: Supplies heavy, demand and movement slow, market weak. Locals: No. 1, per lug, pinks and ripes, 75@1.00; mostly 80@90. No. 2, 50@60.

Turnips: Supplies moderate, market weak. Per dozen bunches, 35@40.

FRESH FRUITS

Apples: Supplies heavy. Demand and movement very slow, market weak. Locals: 2@4; few fancy Yucaipa section, 5@6 per lb. Sebastopol: B Gravensteins, small sizes, 1.00. Watsonville: Fancy 4-tier Bellflowers, 1.50; 4½- tier 1.25; B grade 4-tier, 1.25; 4½-tier, 1.15 @1.20.

Cantaloupes: Supplies liberal, demand and movement moderate, market steady. Home growns: Tiptops, small crates, best, 90@1.00; other varieties, 50@60; Honeydews and Casabas, 1@1½ per lb.

Figs: Supplies moderate, demand good, market firm. Locals: Per box, 75@1.25; mostly 1.00; per lb., 8@10.

Grapes: Supplies liberal, movement good, market firm. Muscats, mostly 5@5½; Tokays, 7@8; few fancy Black Hamburgs, 5@6; Thompson Seedless, 5@6; Cornichons, 6 per lb.; Zinfandels, 5 per lb; Concords, 2.50 per lug.

Peaches: Supplies heavy, demand moderate, market weak. Wide range in quality and condition. Freestones mostly 75 @1.00; few best, 1.25; poorer, 40@65 per lug. Clings mostly 75@1.25, according to quality.

Pears: Demand and movement moderate, market firm. Bartletts mostly 5@6, few 6½@7; poorer, 3½@4 per lb.

Prunes: Supplies moderate, demand good, market firm, various varieties 5@6 lb.

Watermelons: Supplies heavy. Demand moderate, market steady. Locals: Klondikes mostly ½, few ¾ per lb.

CITRUS FRUITS

Grapefruit: Supplies moderate, movement moderate, market firm. Local: market pack, mostly 3.50@4.00; smaller, 2.50@3.00 special packed, 4.00@4.50.

Lemons: Supplies liberal. Demand moderate, market firm. Local: Special pack mostly 5.00@5.50; market pack, best, 3.50 @3.75; poorer, 2.75; lugs, 90@1.00.

Oranges: Supplies moderte. Demand moderate, market firm. Special brands mostly 5.50@6.00; market pack, 3.50@3.75; small sizes, 2.25@2.75; loose pack, 1.00@1.50, mostly 1.00@1.25.

HONEY

Supplies of white honey nearly cleaned up account short crop and good demand. Production of fancy grades considered only 25 per cent of normal. Moderate supplies of other grades new crop but old crop supplies nearly exhausted. Light nectar flow from beans anticipated. Demand fairly active past two weeks and prices advanced slightly. Market firm at present. Carload f. o. b. usual terms at loading points. White orange, 10½@11¼; white sage, 9½@11; light amber sage, new crop, 7@8; old crop, 7; light amber alfalfa, new crop, 5¼@5½; old crop, few sales, 5½. The quality of new crop alfalfa and sage said to be variable, due to the unfavorable season. Beeswax: Supplies moderate, demand light, market weak. Growers receiving 22@23; dealers asking 25 for crude wax.

GRAIN AND FEEDS

Grain Exch. price bid September 27:
Barley: 100 ton lots, Oct. del., 1.55.
Milo: 100 ton lots, Oct. del., 1.28.

HAY

Alfalfa Growers of California report:

Market past week firm in all parts of the state, especially for higher grades, and exceeded the supply as far as these grades of hay were concerned. In Los Angeles market Standard sells at $16, No. 1 Dairy is in sharp demand at $21 and $22, and rabbit and goat hay at $27, but could fill only a small part of orders for this grade. There is a continued sharp demand for fertilizer alfalfa from the orange districts in the southern part of the state but supplies of damaged hay in the alfalfa producing sections there are about exhausted; further business in large volume will therefore only be possible if users are willing to advance their bids sufficiently to meet the price for the next better grade of hay or to cover the cost of the higher freight rate in bringing damaged hay from the more distant parts of the state.

There were 730 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending September 24, with 120 tons held over.

Prevailing prices, delivered in vicinity of Los Angeles:

Choice Rabbit Alfalfa	$28.00
Choice Dairy	24.00
No. 1 Dairy	21.00
Standard	16.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, Rabbit	22.00@26.00
Alfalfa, No. 1 Dairy	19.00@21.00
Standard	16.00@18.00

San Francisco Markets

San Francisco, Sept. 27. 1921.

Cranberries	5.75
Bayos	5.70
Blackeyes	3.55

HAY AND FEED

A. W. Scott Co. says under date of Sept. 24:

Receipts were 1,288½ tons. All grades of hay and all branches of business seem to record a little movement and more encouraging conditions; while prices may not respond for some time on account of the oversupply, nevertheless better markets seem to be developing and we can report the situation as one of much encouragement. Alfalfa has been moving a little more actively on account of a few small scattered export shipments, but with so little local demand as to keep prices at their present low level.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission, and handling expenses must be added, according to conditions).

Wheat Hay No. 1	15.00@18.00
Wheat Hay, fair grade	13.00@15.60
Tame Oat Hay	12.00@15.00

Citrus Markets

Los Angeles. Sept. 28, 1921.

The old citrus year has but a few weeks to finish the greatest of all the years in citrus shipments from California. Most of the Valencias remaining will be off the trees by the first day of November, and observers are carefully taking note of Navel condition. Accurate figures are not available but rough estimates are that the crop will be materially larger than the present year, in some sections as great an increase as 25 per cent is noted. The Florida crop will be somewhat greater than that of last year.

The lemon market continues excellent.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 38,253 cars; lemons, 10,876; total, 49,129. To same date last season: Oranges, 29,092; lemons, 7,767; total, 36,859. From Central California to date this season: Oranges, 6,649; lemons 212; total, 6,861. To same date last season: Oranges, 5,381; lemons, 289; total 5,670. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 23; total, 284.

New Lamp Burns 94% Air

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. N. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

The Problem of Plowing an Orange Grove

It is generally admitted and in fact seldom questioned that the planting of a cover crop in an orange grove is absolutely necessary. There has been serious difficulty, however, in plowing the cover crop under due to the fact that up until now there has been no really satisfactory orchard plow offered for sale for plowing under of the cover crop. To do this work successfully the plow should be low to the ground to avoid tearing the trees but at the same time should have plenty of clearance so that the cover crop may be properly turned under. The plow should be designed so that one may get as close to the trees as possible when plowing either to or away without injury to the trees. The wheel base of the plow should be narrow in order that it might get close to the trees at the same time it must not tip over and this has been a common fault with the plows offered to do this work in the past.

It will be a great satisfaction to orchardists to see the new La Crosse Orchard and Vineyard Disc Plow doing all these things and doing them successfully. The La Crosse Orchard Disc Plow is built upon an entirely new principle. The beams are overhead instead of there being a frame around the discs which gives unusual clearance, in fact more clearance than any plow ever offered in this section. This gives the plow a wheel base that makes it almost impossible to turn over. The discs are large, 26 inches wide and are equipped with a practical scraper which acts exactly like a moldboard in turning the cover crop. A cover crop to the height of 4 or 5 feet can be turned so that the ground is left perfectly clean. The discs, when cutting either to or from the trees are well outside of the frame so that it is not possible to get closer to a tree than one can plow with the new La Crosse Plow.

The general agents for this plow in California are Dixon & Griswold, No. 130 North Los Angeles Street, Los Angeles, Cal. The La Crosse Orchard and Vineyard Disc Plows are sold with the distinct understanding that the plow will perform to the absolute satisfaction of the orchardist or the plow may be returned and the purchase price refunded in full. In other words, Dixon & Griswold absolutely guarantee these plows to give perfect satisfaction in orchards or vineyards. Circulars with full descriptive matter and prices may be had upon request.

Public Sale

POLANDS and DUROCS

53 head Big Type and extra good. 2 bred gilts in the Polands. Balance spring gilts including 4 boars. The Polands represent the blood lines of Peter the Great, through his good son Gladiator, Big Orphan, The Argonaut. One litter by the Californian, and other sires recognized by the best breeders of Polands. This is an especially good lot of young gilts, fit to be placed in any herd in the state. The Durocs are headed by the herd sire, a son of Cummin's Good Enough, a prize winner.

Every hen in your flock is a "PROMISE TO PAY"

This hen means well enough. Chances are, she has the best intentions in the world. She is quite willing to own up to the fact that she is your debtor. You feed her. You take good care of her. [Perhaps you've raised her from chickhood.] And you devote your time to her physical welfare. In return for all that, you have every right in the poultry world to expect enough eggs to pay a healthy interest on your investment. But then—

Remember that even the best-intentioned hen won't "pay in full" unless the feed you give her contains the elements necessary for egg-building. Nature provides each laying hen with just so many eggs in embryo. And if you leave it to Mrs. Biddy she is apt to take six or seven years to produce her full quota of eggs. And, incidentally, she is apt to leave *you* high and dry in the process.

Your job, then, is to make Mrs. Hen "make good" her promise to deliver this amount of eggs in *two or three years*. And the biggest single help you can have is SURELAY. For it is SURELAY'S mission to make your hens pay by making them lay.

When we say SURELAY is the "cheapest" feed you can use, we mean just this: SURELAY will net you *more* in return for your feed-money than anything you can buy. You must realize that it takes more energy for a hen to convert poor feed into money than it does to convert good feed into money. What's more—there isn't such a heap o' difference between the cost of good feed and poor feed. But look at the profit-difference when you're through!

That's why thousands and thousands of wise poultrymen have come to bank on SURELAY. It contains the ingredients your hens need to make them profit-producers. These ingredients are balanced and blended more skillfully and economically than can possibly be done by hand. And SURELAY is always uniform—always the same—thanks to our daily laboratory tests!

If you want to see how SURELAY will help you "cash in" on all the "promissory notes" in your flock—simply clip the coupon below. In return you'll get a copy of our booklet, "Makes Hens Happy." It shows how to spur your flock into action and make 'em happy in the bargain. Send for it today—it's free!

More Pest Fighting Suggestions

THE fund of good things given in our issue of September 24 seemed most complete, yet there were other items and illustrations in hand which we had hoped might be given with that issue. They were necessarily held out because we had provided too liberally. As it was, our subscribers have been coming back and asking for additional copies and expressing freely their admiration for the number "well worth far more than the entire year's subscription price." So we give this week a number of illustrations and short articles to round out and complete the fund of spray, dusting and fumigation information.

* * *

GRAPE INSECTS AND DISEASES AND THEIR CONTROL

By Fred K. Howard

California Root Worm (Adoxus obscurus L.)—A black beetle whose larvae attack the leaves, stems, petioles, roots and fruit of vines. Cultivate deeply around the base of the vines. Spray with Formula 19 (as given on page 314 of September 24 issue of Cultivator) as soon as beetles appear.

Erinose (Eriophyes vitis)—This so-called disease is produced by a small mite and is characterized by swellings formed upon the upper surfaces of the leaves. Dust plants lightly with sulphur when they are wet with dew.

Flea Beetle (Haltica carinata Germ.)—It infests the foliage and may be handled by spraying liberally with Formula 19 (see first paragraph).

Grape Leaf Folder (Desmia funeralis Hub.)—The larvae roll themselves up in the leaves which they eat. Spray with 19 (see first paragraph).

Grape Phylloxera (Phylloxera vastatrix)—Attacks roots and foliage of the vines. Plant resistant stock. Be sure of your nursery stock. Give the affected vines the best of care to minimize crop reduction.

Hawk Moth (Philampeles achemon Drury)—The large green larvae of this moth feed upon the foliage. Hand pick, or if too numerous, spray with:

Lead arsenate (paste)	5 pounds
Water	100 gallons
or	
Lead arsenate (powder)	5 pounds
Water	100 gallons

Use casein spreader as directed or 12 pounds atomic sulphur to each 100 gallons.

Nematode Root Gall (Heterodera radicicola Mull.)—A minute worm attacking the small roots. Do not plant infested vines. Control in field impractical. Fertilize and improve general tilth.

Vine Hopper (Typhlocyba comes Say.)—Infests foliage of the vines. Spray as soon as the young begin to appear with

Black Leaf 40	1 pint
Whale oil soap	4 to 5 pounds
Water	200 gallons

Mealy Bug (Pseudococcus bakeri)—Second brood feed on maturing grape cluster. Exude large quantities of honey dew, rendering fruit unfit for sale. Spray vines before buds open with miscible oil, 15 gallons to 200 gallons of water, or after buds open and before shoots reach 1½ inch length with miscible oil, 32-34 degrees Baume, 7 gallons to 200 gallons of water.

Common Cut Worm (Euxoa atomaris)—Attacks opening buds in early spring, feeding at night. Use poison bran mash at base of vines or hand pick with aid of bullseye lantern before midnight.

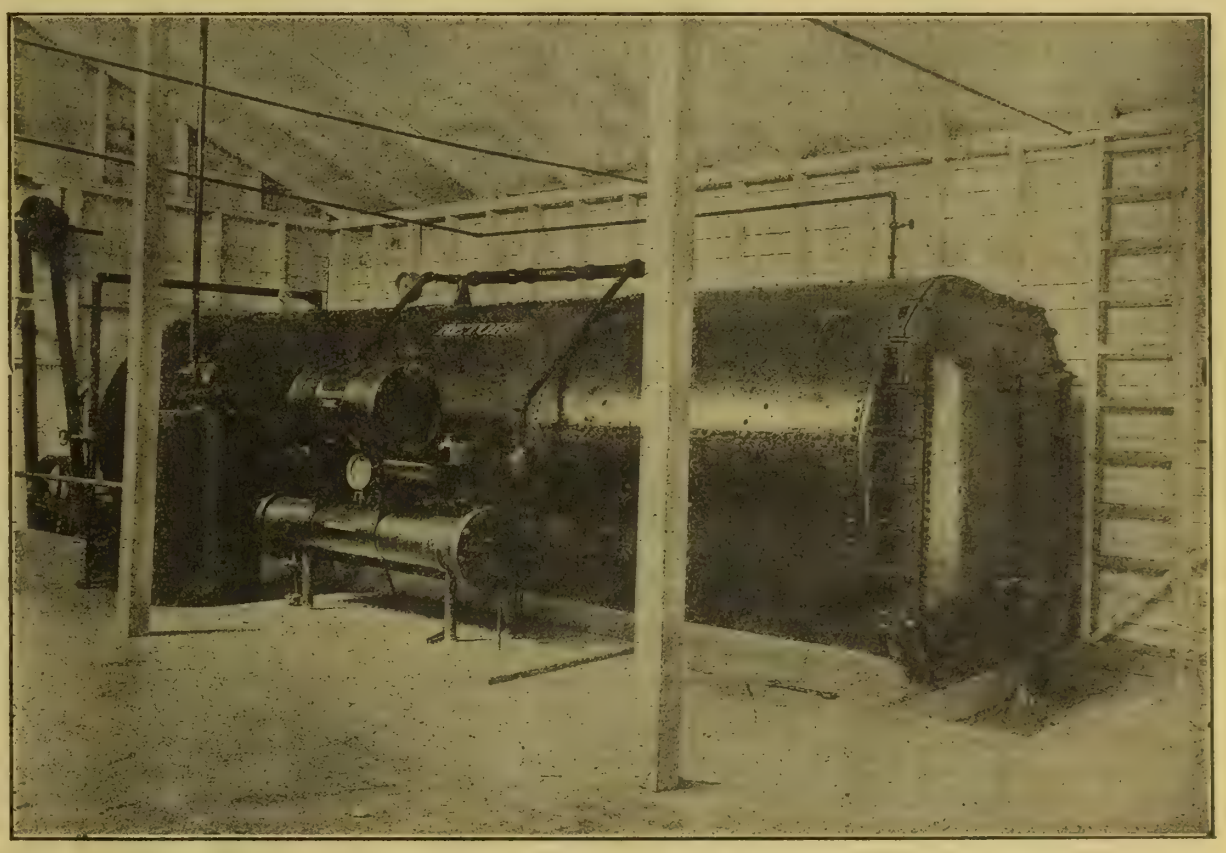
Grape Vine Hoplia (Hoplia callipyge)—Feeds on leaves of grape vines during early summer. Jar into receptacles containing oil or spray every week with arsenical sprays.

Powdery Mildew (Uncinula spiralis and Uncinula necator Schw.)—Grows upon the canes, leaves and fruit. Dust often with sulphur as soon as the disease appears. Spray early with No. 1 or 2 (a) as given on page 313 of September 24 issue of Cultivator.

Cut Worm Bait:

Part I—White arsenic	2½ pounds
Bran	50 pounds
Part II—Lemons (chopped fine, including rind)	½ dozen
Syrup or molasses (cheap)	4 quarts
Water	5 gallons

Mix Part I and Part II and add enough water to make a wet mash. The parts should not be mixed until ready for use.



Big Enough to Take in a Load of Cotton.

Bales of cotton are placed in this vacuum retort. When air is exhausted hydrocyanic acid gas is admitted and penetrates to the very center of the bale. This retort is located in San Francisco. Engraving courtesy state department of agriculture.

NEMATODES

By H. J. Ryan

One of the most insidious of the pests with which the grower of crops must contend is a minute worm known as the root-knot nematode, so named because of the knotty swellings produced upon the roots of infected trees and plants. The swellings should not be confused with the bacteria nodules found on the roots of beans, alfalfa and other leguminous plants nor with the tumors caused by the crown gall organism and known as crown gall root knot. Both of these are in the nature of growths attached to the plant root while the root knot nematode causes a swelling of the root itself which interferes with cell growth and in many cases kills the plant.

An almost unbelievable number of plants are attacked by the little animal. The list of plants known to be immune or somewhat resistant to injury is short in comparison.

Generally speaking the fleshy rooted trees and smaller plants are the most severely injured. Figs and peaches are seriously damaged; potatoes are rendered unsightly for market or table purposes; tomatoes, beets, beans, melons and a number of other plants are often so stunted that a crop cannot be produced.

Too much care can not be exercised to prevent the distribution of infested plants or soil on plants to areas which are free from the pest. Garbage, manure, or waste matter of any kind containing parts of diseased tubers or roots may spread the parasite and should never be placed on uninfested land. The pest is also frequently carried to other fields by means of irrigation water and surface waters resulting from heavy rains.

The most common method of transporting the disease from one locality

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

One of our exchanges in the extreme southern end of the state announces that the farm bureau is asking from the federal government aid in fighting ducks. Another paper in the same county speaks of farmers in that section appealing to the biological survey for aid in securing relief from blackbirds. The survey has been aiding in controlling mountain lions, bobs and other four footed pests, now it will have opportunity to furnish guns and ammunition, and even the hunters, to secure the four and twenty birds to bake in a pie. But, seriously, it is serious when a farmer puts costly seed into the ground and sees the blackbirds by millions devouring it.

* * *

Gifford Pinchot recently made a flying visit to California in the interests of the campaign of preserving for the people their own. In a talk in Los Angeles he referred to an incident where a speaker chose for his subject two letters. The placing of these two letters on a blackboard brought out wildest enthusiasm and prolonged cheering. Those two letters were "T. R." This enthusiasm was not of the political kind but came simply from admiration for integrity, for character, for manhood. Mr. Pinchot said that California's power resources had been preserved for the people because of the staunch stand of Theodore Roosevelt. He then gave warning to the people that if those great privileges were to be preserved the people of all the state must awake and claim them. As to the possibilities in the present fight Mr. Pinchot added: "There is no good thing without a way for securing it."

* * *

Many a man finds the hardest part of a job is getting started to do it. When that man happens to be a farmer it is probable he will leave implements and tractors out in the elements between jobs, and the implement man makes money because of his laxness, that is, providing the farmer saves enough to purchase another new implement.

* * *

Implement people are to gather in Chicago next week and talk with each other as to the needs of agriculture, so far as they can be seen from an implement maker's standpoint, and, incidentally, we doubt not, talk much as to the commercial side of implement marketing. As a hint, we may suggest that if the present effort in congress to secure just marketing privileges in a cooperative way is supported farmers marketing will bring in more money to the implement maker. Farmers will use the latest and best of labor saving implements, not because of pride but because of necessity, but no matter how great the necessity for implements, there is greater necessity for cash.

* * *

The war finance corporation continues extending its activities and is securing real advantage to agricultural interests. Its effectiveness depends largely upon cooperation of national and other bankers. At first many of them looked with distrust upon the work of this board because they did not fully understand the provisions of the act creating it. This has been overcome, and today California and all other states have opportunity to finance large productive undertakings.

* * *

The orange growers have figured out that present day freight rates have added to the cost of California produced oranges from $150 to $200 per acre more than in the good old days of long ago. Not so very long ago, either, though from present indications the long ago will be still longer before material relief is afforded. The western railroads have made fine showing of a reduction which will amount to a few cents per acre, but this offer was conditional upon acceptance by the eastern roads. Presumably the wink was given to the eastern roads and they politely declined to favor those western citrus growers.

* * *

The citrus league is not entirely content with present conditions and is again appealing to the interstate commerce commission for relief. It must ultimately be secured, but the long, long months of waiting are most disheartening to the grower whose funds are all going where the major part of the funds raised by the United States government is going—to support the railroads.

* * *

In acknowledging very material help in the gathering of the great fund of information on fighting of pests which was given in our issue of September 24 and continued in this issue we failed to mention one whose suggestions were used and added much to the completeness of these two numbers. A. O. Larson, assistant entomologist in investigations as to pests infesting truck crops of California, with the station located at Alhambra, assisted in revision of formulas and suggestions as to the handling of crop pests.

SECRETARY WALLACE ENDORSES FIRE PREVENTION DAY

National Fire Prevention Day is to be observed October 10.

Its object is to call attention to the vast annual loss by fires which might have been prevented, and to emphasize the necessity of safeguards against future fires. The Nation's total fire loss is estimated at 15,000 lives and $500,000,000 in property each year.

According to the statistics of the National Board of Fire Underwriters, there were 38,266 fires on farms in 1918 and the estimated loss was $18,166,710. That means that 38,266 rural families in 1918 suffered loss in degrees varying from slight damage to the loss of home, livestock and, in many cases, human life.

Farmers, and all persons in rural communities, well may join in the observance of fire prevention day, both individually and in public gatherings, such as schools, churches and farm organizations.

HENRY C. WALLACE,
Secretary of Agriculture.

ANNUAL ROLL CALL

The Red Cross announces its fifth annual roll call which will be held November 11-24. This will be a campaign for new members and for renewal of memberships already carried. The Red Cross declares that its opportunities for relieving suffering are almost as great now as during the war. In fact, the war is hardly ended in respect to Red Cross service.

WALTER HUGH FLEET

Walter Hugh Fleet, for many years manager of the Sespe Ranch at Fillmore, Ventura County, died in Los Angeles, September 23. Mr. Fleet was not only manager of the great lemon grove but made an intensive study of lemon culture and many other problems confronting managers of large producing properties. These lessons he has not only used in his own business but has at many of the citrus institutes and other conventions given of his knowledge for the information of others. Mr. Fleet was a native of Virginia but has lived in California for nearly 30 years. His pioneer efforts and investigations along cultural lines and his sterling worth and integrity won for him the respect and love of his business associates and others engaged in California productive industry.

DEVELOP THE POWER

The attitude of Californians has materially changed toward the development of our hydroelectric power possibilities. But a few weeks ago charges of "power grabbing" were freely passed back and forth. The effort seemed to be largely to increase the antagonistic spirit, in other words, a manifestation of clenched fists and the shouting of "You shan't have it." The grabbing spirit has not entirely subsided, but there is more "Let us get together and develop the state's resources and use them for the benefit of all." There are certain large interests which are going to secure the privilege of making these great developments to the extreme limit, and there is where cooperation on the part of "We, the people," must be secured.

One great step in this direction was taken last week at Santa Monica at the convention of the League of California Municipalities when, amidst wildest enthusism the delegates to a man passed a resolution endorsing the proposed amendment to the California constitution enabling the people to unite in developing and conserving her water and power.

We noted last week the complete change of front of farm bureaus which were formerly placed on record as opposed to public development and ownership of water and power. That action, with this unanimous vote of the League, is a most hopeful sign. Many counties are now getting into line with organizations whose sole purpose will be the encouragement of this public ownership and distribution campaign.

MARKETING

There are many long questions connected with the question of marketing products which must traverse 3,000 miles of desert and of plain before they reach the greater consuming market. Transportation, direct handling agencies and other considerations are up for decision. The citrus grower, the walnut, the raisin, the prune and many other cooperators have settled these questions, at least partly to their own satisfaction and with a great measure of success. The bean growers, the almond, the canned and dried fruit growers have more of a question confronting them than have the older associations which have arrived. To be sure, these associations have been confronted by problems other than transportation and marketing. Especially is this true with the bean and almond men who have not only had to compete with established marketing systems but have been compelled to market their products alongside of those grown by coolie labor of Asia or underpaid labor of Mediterranean countries. Some of the canned fruit people arranged some years ago with a large packing concern of the East, a concern which handles many products but had no canned fruit. While the wisdom of the combination of cooperators with the large trust was questioned by many the immediate results were very satisfactory to the producer. Through federal regulations in effect decreeing that meat packers should not handle groceries or other side products the arrangement was necessarily terminated, and California cooperators are suffering. With cooperators handling only a few hundreds of carloads of canned goods it seems impossible to create a big marketing machine at a low enough cost to let the grower by with his fair proportion of the return. Then how may the machinery of marketing be created which will help cooperative cannery people to dispose of their products? The cooperators so far have answered: "We do not know," and are appealing to Attorney General Dougherty to consent to a modification of the decree which cancelled the arrangement through cooperators and packing concerns. This appeal is concerned in no way with the packer control bill now before congress, but simply asks the federal courts for temporary relief

Annual of Los Angeles County Farm Bureau

THE Los Angeles County Farm Bureau held an all-day convention and picnic at Ganesha Park, Pomona. It appeared there were acres of autos in attendance, and the crowd under the trees and in front of the bandstand showed that most of the automobiles had emptied their loads of farm bureau people. The principal feature of the day was the awarding or presenting of the silver cups which have been won by members of the dairy cow competition. This competition has covered the year from July 1, 1920. The winners are:

Class A—1, Fred Hartsook, 33 cows tested, average fat per cow, 475.4 pounds. 2, Earl Graham, 34 cows, 470.9 pounds.

Class B—1. E. L. White, 77 cows, average fat, 399.0. 2, L. A. County Farm, 105 cows, 372.1.

Class C—1, H. Michel, 194 cows, 330.5. 2, Adohr Stock Farms, 283 cows, 320.2.

Class D—1, Brant Rancho, 571.7 pounds fat. 2, Brant, 543.6.

Class DD—1, F. F. Pellissier, 496.3 pounds fat. 2, L. A. Conuty, 476.2.

Class E—1, Graham, 739. 2, Hartsook, 696.1.

Class EE—1, Graham, 740.0. 2, Pelissier, 714.6.

Class F—1, Graham, 658.1. 2, Hartsook, 644.7.

Class G—1, L. A. County, 637.8. (cows milked three times daily). 2, Burr Farm, 647.6 (cows milked four times daily.)

Class H—Pellissier, 638.2 pounds. 2, Pellissier, 553.1.

In addition, winners of the Southern California Milk Producers Association awards only to their own members were as follows:

Class A—Highest herd average under 60 pounds, Hartsook.

Class B—Highest herd average 60-150 cows, Burr Farm.

Class C—Highest herd average over 150 pounds, no herd competing.

Class D—Highest producing pure bred heifer, first calving, Burr Farm.

Class DD—Highest producing herd heifer grade, first calving, Ira S. Hostettler.

Class E—Highest producing pure bred cow, Graham.

Class EE—Highest producing grade cows, Graham.

Class F—Best five cows in Class A herds, Graham.

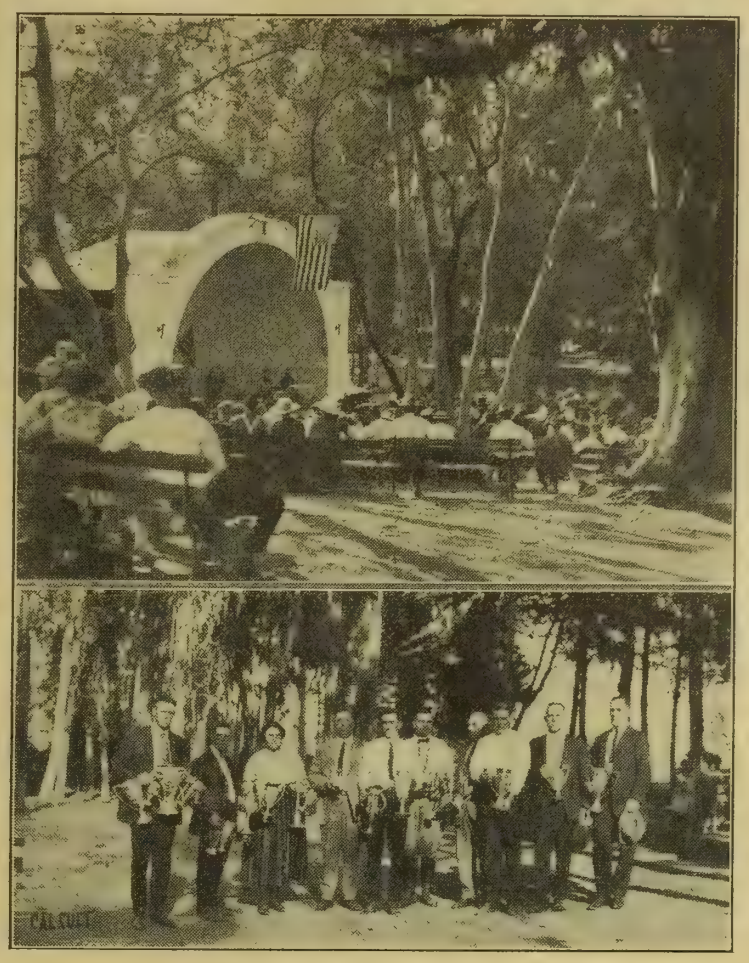
Class G—Best five cows in Class B herds, Burr.

Class H—Best five cows in Class C, no herds competing.

From report on the work of the dairymen's department we quote:

"It is now three and a half years since the organization of the Los Angeles County Cow Testing Association under the auspices of this farm bureau. As you know, the function of such an association is to furnish the member dairymen with accurate figures on the monthly milk and butterfat production of each cow. This is done by sending an association employe to each ranch once a month to weigh and record the milk produced and test it by the Babcock method for the content of butterfat. These records are extremely useful, in fact indispensable, if the man is to continue in the dairy business under present day conditions. The average dairy cow in the United States does not produce enough fat in a year to pay for her feed under

(Continued on Pagt 371.)



A Typical California Farm Bureau Meeting

Upper shows the audience in front of bandstand listening to closing of the program. One of the last features was the awarding of silver cups for which dairymen of the county have been striving during the past year. The lower engraving shows the winners after they secured possession of the cups.

San Diego County Farm Bureau Fair

By Robert R. McLean

THE two outstanding features of the Third Annual San Diego County Farm Bureau Fair were better and more comprehensive exhibits than have been made in previous years by the farm centers and home departments, and a much larger showing of livestock, cattle, horses, and poultry.

This latter feature is probably the most encouraging and hopeful indication of better days ahead for agriculture. In many fruit sections of California it has been apparent for years that the livestock industry was not being rated at its true value, but signs have not been lacking for many months of a revival of interest. A necessary supplement to fruit growing as it is, as well as an original source of wealth, the development of the livestock industry all over the state should be encouraged by everyone interested in permanent agriculture.

The farm bureau exhibits were many and varied. Notwithstanding the fact that the rainfall for this section has been far below normal for two years now, displays from dry farming communities far surpassed anything yet undertaken by these farm centers. This can be directly accounted for by better methods of tillage, proper rotation of crops, heavier fertilization, selection of seeds and conservation of water, due in larger part to the educational stimulus of the farm bureau movement.

Perhaps the most remarkable strictly dry farming showing was made by the Jamul center, it being awarded fourth prize in the community exhibit competition. Japatul center, also a dry farming section, but with a slightly heavier annual rainfall, was given first prize. This mountain community was organized into a farm center some two years ago, making its first exhibit last year and winning fourth place at that time. This year it was awarded 98 points out of a possible 100, winning over long established irrigated sections. This was possible only because of the united purpose of the center, every family in the community being actively connected with the farm bureau and home department. Exactly 247 varieties of fruits, vegetables and other soil products were shown by this center.

The Prize Winner at San Diego County Fair

The diversity of productions of Japatul Valley is abundantly shown in this photograph.

Poway, famous for its grapes and peaches, won second honors and again was given a perfect score for quality. El Cajon, first last year, took third, and the new center of Otay, fifth. Among the horticultural novelties shown by El Cajon were an Egyptian melon from the near East, the flesh of which is white, and a mammoth European "Potiron" squash.

The new farm bureaus of Valley Center, Bear Valley and Otay made creditable exhibits, featuring fruits and vegetables especially suitable to their respective sections. There are 21 families in the Bear Valley district and the number of members of the farm bureau and home department totals 35.

Fallbrook center featured many varieties of corn, as well as grain and sweet sorghums, fruits, beans and honey; Escondido, citrus fruits, grains, deciduous fruits and grapes; El Cajon, rare fruits, grapes, deciduous and citrus fruits; Potrero, apples, peaches, plums and canned fruits; Ramona, eggs and deciduous fruits; Encinitas-Olivenhain, beans, fruits and honey; Lakeside, many kinds of corn, other sorghums, grains, fruits and eggs; Oceanside Union, fruits, vegetables and beans.

The Chula Vista district, although not organized into a farm bureau, made an exceedingly interesting display of citrus and sub-tropical fruits, many of the latter being from the U. S. D. A. experiment station located there. Among those noted were the pepino, sometimes called the melon pear (solanum muricatum), white sapotes, avocados, mountain papayas (carica candamarcenses) from the mountains of Colombia and Ecuador, Natal plums (carissa grandiflora) and Orinoco bananas. One clump of this latter fruit bore six bunches at the station last year.

Illustrating the individual interest taken by some members of the farm bureau in their community exhibits, C. Nelson of Potrero entered 31 kinds of canned fruits and 64 varieties of fresh fruits and vegetables, J. S. Scott of El Cajon, 55 varieties, and O. Dannesboe of Carlsbad, 45 varieties of vegetables. In the general horticultural exhibit J.

(Continued on Page 370.)

Agricultural News Notes of the Pacific Coast

Northern California

The rice crop in Glenn County is moving into warehouses. Average production is good.

The Santa Rita Stock Farm west of Livermore has been sold to A. V. Mendenhall of Oakland.

Because of the county fair at Red Bluff no farm center meetings were held last week in Tehama County.

The poultry demonstration plant at Hayward is in full swing. It is in charge of the Alameda County farm bureau.

The Alameda County Farm Bureau Exchange will reduce admission fee from $50 to $25 "in justice to the small land owner."

Pleasanton, Alameda County, will harvest some 6,000 tons of sugar beets. They are sent to the factory at Spreckels.

The annual convention of agricultural instructors of Northern California will be held at Colusa at an early date to be announced soon.

Demonstrations of care and handling of bees have been given in different sections of Placer County by Prof. Coleman of the state university.

Secretary Merry of the Pacific Rice Growers Association says that his association has not applied to the war finance corporation for marketing funds.

Glenn County farm bureau center meetings: Directors, Willows, October 8; Codora, 10; Orland, 12; Jacinto, 14; Capay, 19; Plaza, 21; Grapevine, 26; Larkin, 28.

At a meeting of the Farmers Protective Association held at Livermore, Alameda County, last week, it was decided to establish a meat market there in endeavor to lower retail costs.

Directors of the Placer County farm bureau held their October 1 meeting on the R. S. Seydel ranch at Lincoln. Special discussion of fruit growers convention at Auburn, October 11-12.

Receipts from the federal government from grazing permits and sale of timber amount to $17,806.25 for Plumas County; $14,119.03 for Tuolumne; $11,479.30 for Eldorado; $109.44 for Colusa.

The Alameda County farm bureau has formally severed connection with "so-called farmers cooperative market maintained by W. S. Mooney on the corner of Telegraph Avenue and 19th Street in Oakland."

Last spring the Placer County chamber of commerce inaugurated a plan to replace Japanese with white lessees on fruit lands. To date 700 white families have replaced Jap tenants, according to report of Secretary Pottenger of the chamber.

The state college of agriculture will hold again this year a fruit show. It will be at Berkeley, November 17-19. Fruit growers are asked to exhibit. This will be made an educational feature with lectures and demonstrations upon deciduous fruit growing.

State Market Director Maddox called a meeting of rice growers of the Colusa district, September 26, to talk over cooperative marketing of their product. The growers failed to answer call but Mr. Maddox reports that differences have been smoothed out and probably no independent association will be attempted.

Central California

Inyo County staged a successful fair at Bishop, October 4, 5 and 6.

Fresno County fair just closed had a large and representative livestock exhibit.

Stanislaus County farm bureau is organizing a new cow testing department.

A home department has been organized in the Stanislaus County farm bureau.

Stanislaus County expects to enroll 400 members in its home demonstration department.

Directors of the Modesto irrigation district have approved plans for concrete lining of many canals.

Showers in the San Joaquin Valley the middle of September had no injurious effect on raisin crops.

The Stanislaus County farm bureau will soon start a campaign to increase its membership from 1,200 to 2,000.

The Harvest Festival at Waterford, Stanislaus County, September 29-October 1, brought out a fine exhibition of poultry.

San Joaquin Valley rice growers are informed that all their 1920 crop has been disposed of by the Pacific Rice Growers.

The Spreckels, Monterey County, sugar factory started its season's run September 17 and expects to run through January.

Scotts Valley, Santa Cruz County, held an old fashioned country fair and harvest festival September 22-24. Nine farm centers united in the fair.

Santa Clara County ranchers who established the farmers free markets in San Francisco are satisfied with the business they have transacted there.

A harvest festival and community fair was held at Waterford, Stanislaus County, September 29 to October 1. There were more than 200 entries of poultry.

The Tulare County horticultural commission distributed during August in its rodent fight 3,240 pounds of poison, 4,550 pounds of carbon, 25,100 jute balls.

The section of Stanislaus County west of the San Joaquin campaigned against the ground squirrels last week. This winter a carbon drive will follow the fall poisoning.

A carload of Blackeye beans was shipped from Stanislaus early in August to Memphis, Tennessee. Memphis is said to be the largest Blackeye bean market in the United States.

Farm Adviser Conner of Tulare County is visiting all the schools in the county, talking to pupils on organization of calf, pig and poultry clubs. Work of organization will be taken up about a month later.

The Associated Raisin Company has leased the warehouse of the alfalfa mills at Kerman and will use as a receiving plant. This, with the packing plant at Biola, it is hoped will relieve congestion in Kerman deliveries.

Commissioner Waite of Imperial County referring to some real estate boosting of the money to be made in Imperial Valley vineyards says "The truth is good enough. As a matter of fact the vineyards of the valley are averaging $400 an acre."

Southern California

An apple packing plant has been established in Redlands.

A state dairy inspector has been located in Imperial Valley.

Palo Verde Valley cotton growers are receiving $13 per ton for cotton seed.

A horticultural inspector has been located at Victorville, San Bernardino County.

Carpinteria bean growers have appreciated the warm weather at threshing time.

Citrus growers of Covina met last Tuesday to talk over shipment of their fruits via Panama Canal.

Sales of Delicious apples are reported from Yucaipa Valley at $2.75 for Fancy and $2.50 for B grade.

A Santa Ana orange grower reported to the sheriff's office theft of fruit from 100 of his Valencia trees.

The El Centro chamber of commerce is planning for a fair to be held some time the latter part of October.

A. V. Buell of Carpinteria brought home from the San Fernando fair 22 ribbons on nine head of Hampshires.

The Rialto Heights Citrus Association made a season's average of $2.78 per packed box including all sizes and grades.

Cotton pickers in the Imperial Valley are being paid 80 cents a hundred, and below the Mexican border, 40 to 60 cents.

The annual convention of the California Fruit Growers and Farmers will be held at Exposition Park, Los Angeles, October 24-26.

Picking of "Delicious" apples in Yucaipa Valley shows big percentage of large sizes. Opening prices on eastern markets, $3.75 to $5 per box.

Water transportation for fruits will be one of the big questions discussed at the farmers and fruit growers convention at Los Angeles, October 24-26.

The beekeepers department of the Orange County farm bureau had a big showing at the county fair held at Huntington Beach September 28-October 1.

Lettuce growers of the Imperial Valley have been notified that the freight rate to Chicago will be $1.45 instead of $1.66½; to Missouri river points, $1.39 instead of $1.59.

Imperial Valley irrigators are still investigating the Boulder Canyon dam and all-American canal project in connection with the various hyrdo-electric development proposals.

Ventura County mourns the death of W. H. Fleet, manager of Rancho Sespe. Mr. Fleet was for 33 years a resident of the county and engaged in orchard development.

C. W. Brown of Calipatria, chairman of the duck control committee of the Imperial County farm bureau, has asked federal aid to combat the nuisance of the myriads of ducks in the valley each winter.

The annual meeting of the county horticultural commissioners will be held in Los Angeles, October 27-28, in conjunction with the Fruit Growers and Farmers Convention, which will be in session October 24-26.

Showers of the past week have proved efficient fire fighters, much to the relief of the men who were combating the flames in the foothills and mountains and of the property owners whose farms and future water supply was endangered.

The Coast and General

New Mexico expects a bumper crop of corn.

Yakima, Washington, began shipping Jonathans last week.

The cannery at Cottage Grove, Oregon, has a weekly payroll of $2,800.

The Mount Vernon district of Texas reports sweet potato crop short.

The Yakima Valley, Washington, will ship out 200 carloads of onions.

Phoenix reports more than 2,000 bales of Arizona Pima cotton sold during the last two weeks.

Arizona has two cow testing associations and it is expected several others will be organized the coming fall.

For the marketing of the Arizona cotton crop the War Finance Corporation has extended a credit of $1,200,000.

The honey crop of Western Washington will be 50 per cent short this year on account of the ravages of foul brood.

Arizona cattle men expect 1922 to be a prosperous year because heavy rains have assured the best of pasture and feed.

Reduction of 20 per cent in freight rates on livestock, except horses and mules, effective September 20 to December 31.

The Pacific Mail Co.'s steamship, Golden Gate, carried 600 Filipinos to the Hawaiian Islands to help in relieving labor shortage.

The Wenatchee, Washington, apple season is a week earlier than last year. The first carload of King Davids was sent to New York September 8.

Clarke and Skamania Counties of Oregon will cooperate in putting on an exhibit at the National Grange convention in Portland in November.

A large number of feeder cattle are being brought from Montana to the Yakima Valley, Washington, because of the large supply of cheap feed.

The 58th annual convention of the American Veterinary Medical Association was held at Denver September 5-10, with 500 delegates attending.

The Yakima Valley is the largest of the potato growing districts of Oregon and Washington. This year's crop is estimated at between 3500 and 4500 cars.

Washington cranberry growers are holding out for $5 per box shipping point. With light Eastern production they feel that their fruit should bring good prices.

Stock of all kinds are in excellent condition and roundups are in progress in various parts of Arizona where animals are being gathered for veal and fat range cattle.

Most of the oats and wheat in northern Arizona are in shock and have been put up in splendid condition. All crops in that section are much above the average as to quality and quantity.

Eighty carloads of fruit daily were shipped out from the Yakima Valley of Washington during the month of August. One week's shipments during the pear season amounted to 708 carloads.

Secretary of the Interior Fall has ruled that no more leases on the Yakima Indian reservation in Washington will be issued to Japanese. Effort has been made to secure this ruling for two years.

As Others See Us

By Geo. H. Woolley, Jr.

CALIFORNIA'S cultural conditions are different. The soils seem to call for handling different from that of eastern soils. The climate calls for deeper culture that the rains, which are all too light, many penetrate as deeply as possible and then be conserved as carefully as possible; so we plow deeper than any other sections of this country, and our orchardists, feeling that plowing is not sufficient, bring the sub-soiler into use. Therefore, some eastern manufacturers of tractors have asked. "What ails California? What does she need? Why are those heavy weight implements and tools required?"

To secure answers to their own satisfaction they have sent experts to this state, some of whom have spent months studying and observing. One of these men, Geo. H. Woolley, Jr., of the Hyatt Roller Bearing Co., spent three months here interviewing tractor dealers and farmers who had tested out under varying conditions power farming machinery. Mr. Woolley makes report from which we are permitted to quote.

* * *

In the evolution of California agriculture the tractor has played an important role. Confronted with wide expanses of prairie lands, unusual climatic conditions and varying soil textures, the limitations of animal power were early recognized. Tractors have been in use on the ranches of California for over 15 years. In no other section of the country has the tractor gained a stronger foothold. In no other section is it more closely dovetailed into the routine of farm work.

During the rush season it is quite customary for the larger operators to run three crews in eight hour shifts, and they not only want but demand that a tractor work 24 hours a day, day in and day out, until the rush season is over. Ordinarily the California rancher will get more work out of a tractor in one season than would result from several years' use in other agricultural sections. Hence, a study of the farm machinery industry in California is not only interesting within itself, but throws some light on what may be expected in the way of future developments elsewhere.

Diversity of Uses

In California the use of tractors is by no means limited to plowing and harvesting. They are used more extensively for belt work than in other sections. Furthermore, their use is not confined to conventional ranch operations. Many machines are sold for building roads, levees and ditches. The logging camps of northern California offer a big market for the larger machines.

The original California ranches were extremely large. In many cases the fields were measured in square miles rather than acres. The large track type tractor was first developed to handle these wide expanses of rough virgin land. The successful operations of this type of machine gained for it a strong foothold, and for a number of years the track type tractor has dominated power farming on the Coast.

Following the pioneer days, ranches became smaller and were more intensively cultivated. Small tractors of the track type have been developed to meet these new conditions and, as the acreage per ranch becomes less, the wheel tractor is coming into more general favor.

Market For All Types

With a few extra appliances wheel tractors are now being used on ranches where in the past it had been thought that nothing but the track type could work successfully. Traction is the big factor, and some of the wheel machines are gaining effective traction by the use of two or more extension rims. This practice seems to be quite necessary when working on the light soil.

There always will be a big demand for the large track type. Many thousands of acres are controlled by syndicates who use this kind of machine for all heavy work, such as plowing, harrowing, disking, harvesting, etc. An excellent example of the large scale operations in practice on the Coast is afforded by the mammoth combined harvester. With this outfit one acre of wheat is cut, threshed, cleaned and bagged, ready for the market, every six minutes. However, even the largest operators use wheel machines, especially for seeding and light hauling around the ranch.

Soil Conditions

Many kinds of soil are found in California. In fact there are from six to ten distinctly different soils on the average ranch. In a half mile furrow, I had the opportunity of observing soil variations including white ash, blow sand, red clay, adobe, chocolate dry bog and Bermuda sod. Obviously, with such frequent soil variations, it is practically impossible to get an even job of plowing with horses. On the other hand, with a farm tractor of sufficient power, the furrow may be turned at an even depth through the hard spots without readjusting the plow. Underlying all such soils is a hard red clay sub-soil which is surprisingly uniform.

Before the advent of power farming, subsoiling was done with dynamite, because it was difficult to do a satisfactory job when using horses. The use of dynamite usually left a hard packed wall. This, in itself, was bad enough, not to mention the danger element. The practice of subsoiling is now coming into greater favor because it has been demonstrated that such work can be done more economically and effectively by the use of the tractor.

To meet the demands of the Pacific Coast ranchers special implements such as combined harvesters, orchard plows and disk sand sub-soilers have been developed, but in most cases the implements used in other parts of the country give satisfaction in the West.

Diversification of Crops

In former days wheat was the one big stable crop. Today it is hard to name anything that is not grown in California, and in no other state are the marketing channels so highly and effectively organized. Diversified crops are the direct result of power farming, and they, in turn, have created a demand for all kinds and types of farm machinery. The farm tractor in some form or another has a sphere of usefulness in connection with each of these crops. Perhaps the crops that lend themselves most successfully to tractor operations are grains of all kinds, fruits, beets, hay, cotton and beans.

Tractor in Rice Fields

A tractor is particularly useful in the rice fields. The year 1912 saw the first introduction of rice growing in California. The year 1919 showed California to be the second state in the production of rice. Land which five years ago was considered worthless is now valued at from three to four hundred dollars per acre. One crop of rice often improves the soil so that a good crop of barley, broom corn, or other crops may be raised.

A successful rice crop depends largely on good ditches and levees, and the loss of water from broken levees greatly reduces the yield per acre, sometimes entirely wiping out the profit from the crop. Furthermore it is important that the leveling be well done. High spots receiving insufficient water will not raise any rice. Low spots are impossible to drain at harvest time.

It is essential that rice be put in at just the right season and the time for harvesting is very limited due to the fact that the winter rains are apt to set in. Therefore it is essential that the implements used at harvest be strictly up-to-date and built to withstand the severe conditions imposed upon them. The loss of a very few hours may sometimes spell disaster.

The tractor also has its field of usefulness in waging war against the pests that prove so troublesome throughout this country. With the aid of a tractor the rancher can put in his wheat crop earlier than would otherwise be possible. Wheat sown at just the right time attains an early maturity and more readily withstands the attacks of the Hessian fly.

Cotton in California

Cotton is becoming one of the most important crops of Southern California. Fifteen years ago the yield was nothing. In 1920 the value of the crop will run something over $60,000,000. Last year there were under cultivation 250,000 acres. This year the acreage will be materially increased. It is quite essential that cotton be cultivated several times during the season, and for this work the motor cultivator is coming into extensive use.

The boll weevil has not as yet made its appearance, nevertheless it behooves the rancher to be constantly on guard for this pest, and a very effective precaution is to turn the stalks under as soon after harvesting as possible. This can best be accomplished by the use of the tractor.

Garden Tractor Market

The vast irrigation system which is spreading through the state is transforming unproductive land into truck gardens. Many of these ranches are large enough to well afford a medium size tractor of either the track type or the wheel type. Even the smallest truck farms offer a ready market for garden tractors, which are becoming very popular.

Orchard Work

Tractors are used extensively in orchard work. This is a strong argument in favor of power farming economy. No ranchers keep more accurate cost accounts than do the California orchardists, nor is there any other class of producers who use more tractors to the acres cultivated.

The Business of Farming

California agriculture has been reduced to a scientific business basis. A tractor is purchased as an investment. It has been proved a necessity. The California rancher is sold on the power farming idea. At the present time service is the prime consideration on the part of the buyer.

Most of the ranchers who operate two or more tractors have at least one repair man whose sole purpose is to keep the tractors in running order. Ordinarily the tractioneer is not expected or allowed to make mechanical adjustments or repairs. It is recognized that his qualifications do not necessarily make him a repair man. When a tractor shows signs of needing attention, a competent repair man is despatched to do the work.

All other things being equal, the rancher will buy of the dealer who is best fitted to render prompt and efficient service. This does not mean that he expects something for nothing, but he does insist that sufficient parts be kept in stock to take care of him in any emergency.

Need for Educational Work

A better understanding of the tractor on the part of the rancher is highly desirable. Above all things the tractor must be kept running. Service in the form of simple instruction at the time of purchase is more effective than repair work at a later date. I have been told by manufacturers, dealers and ranchers alike that 80 per cent of the repair service could be eliminated if the dealer would thoroughly instruct the rancher regarding the care and operation of the different parts of the machine.

The tractor manufacturer who seeks a permanent market on the Pacific Coast should guard against extravagant advertising claims. Often it has been found that a tractor advertised to pull three plows has been unable to pull more than two under the conditions peculiar to this territory. The dealer should remember that the test upon which such ratings are based were made in other sections of the country where the draft per bottom does not run so high.

The rancher thinks in terms of number of bottoms. Any effort on the part of the manufacturer to rate his tractor accordingly is likely to result in a misunderstanding. Therefore the only safe procedure is to give horsepower only, and it is up to the dealer to interpret this horsepower to the rancher in terms of number of bottoms, basing his interpretation on the actual soil conditions to be encountered. The more successful dealers are underselling their tractors rather than overselling them.

Labor Situation

The labor situation in the West seems to be about the same as it is in other parts of the country. While wages are high, often amounting to $7 a day, nevertheless it is difficult to secure help. In order to operate a ranch profitably the use of power farming equipment is imperative. To secure and hold ranch labor the living conditions must be attractive. The ranchers operating on a large scale are giving this subject much consideration. Besides motorizing their ranches, they are building modern houses fitted with running water, shower baths, electric lights and other conveniences of the city. The floating ranch laborer of yesterday, the man who carried his roll on his back, is rapidly becoming a thing of the past. He finds it more profitable to settle down than to move from place to place.

California as Future Market

The aggressiveness of the Pacific Coast rancher, the increasing shortage of labor, the improved irrigation systems and the tendency toward a still further diversification of crops, make this field one of the most attractive markets in the world for the sale of modern power farming equipment. The dealer who is alive to the potential possibilities and who is keeping abreast of the rapid strides of power farming is dominating tractor distribution in California. The rancher wants the very best equipment and he is willing to pay the price.

About 90 per cent of the farm machinery business is conducted on a cash basis. Nevertheless, the banks do not hesitate to discount the ranchers' paper. They are liberally inclined toward the ranch machinery industry. This, I believe, is a reflection of the businesslike methods under which agriculture is conducted. When a man is in a position to show accurate financial statements he has no trouble in securing the credit to which he is entitled.

Genuine Hairy Peruvian

is now positively identified and you have the growers' assurance of Genuine Hairy Peruvian Alfalfa Seed when you are particular to buy seed by the RED SEAL BRAND. Ask your dealer about it TODAY.

RED SEAL BRAND Hairy Peruvian Alfalfa Seed is sold only in the original trade-marked bag. Also look for the Blue Tag.

STRAWBERRIES

The Golden Fruit for a GOLDEN STATE.

My stock of plants consists of the very finest plants to be had, and varieties the very best.

I have for several years supplied some of the large growers of California with such varieties as Nick Ohmer, Marshall, Klondyke, Kellogg's Premier, etc. Ask for my free catalogue describing these berries and about 30 other varieties.

V. R. ALLEN
SEAFORD, DELAWARE

PEST FIGHTING SUGGESTIONS

(Continued from Cover Page.)

to another is through shipments of nursery stock, tubers, and bulbs. No nursery stock should be accepted until it has been found free from nematodes, and, if suspected of having come from infested districts, it should be planted on a separate part of the farm until upon examination later it is found to be free from the trouble. In certain irrigated districts of California and Nevada seed potatoes have been chiefly instrumental in introducing and spreading the worm. In attempting to control this disease it is absolutely essential to plant only unifested tubers.

No trees, plant or potatoes should be set out until they have been examined by a county horticultural inspector.

Nematodes may also be carried from field to field by such agencies as running water and the soil which clings to agricultural implements, the feet of men, and the hoofs of animals.

The disease may be eliminated in greenhouses and seed beds when they are not being used by the application of steam under high pressure or by the introduction of uninfested soil into clean, whitewashed benches.

BIOLOGICAL CONTROL OF INSECTS

Alexander Craw, Albert Koebele, George Compere, Harry Smith and some others who have been for a long time engaged in securing and encouraging the insects that destroy insects, have not the honor of being the very first ones on the game. These men have done noble service, and California and the world honors them, and this is not meant in any way to detract from the value of the service they have rendered, but we now note in "Science" of August 15, 1921, in a report made by Paul Popenoe:

"Control of destructive insects by the introduction of their natural enemies has become an important technique during the last generation. But if competent observers are to be trusted the southern Arabs employed the same method more than 150 years ago in the culture of the date palm.

"In his 'Relation d'un Voyage dans l'Yemen' (Paris, 1880, p. 155), P. E. Botta says:

"I was able to verify the singular fact previously observed by Forskal, that the date palms in Yemen are attacked by a species of ant which would cause them to perish, if each year the growers did not bring from the mountains and fasten in the tops of the palms branches of a tree that I did not recognize, which contain the nests of another species of ant which destroys that of the date palm."

"P. Forskal was the naturalist of C. Niebuhr's expedition; his work was published posthumously in 1775. I have not seen his account to which Botta refers.

"It would be interesting to know whether the history of economic entomology furnishes any earlier record of the 'biological method' of pest control."

GRAPE PHYLLOXERA

In Bulletin No. 903 of the United States department of agriculture, W. M. Davidson and R. L. Nougaret have written a complete 128-page history of this grape pest, Phylloxera vitifoliat, in California, its injuries to the industry, etc., but remedial measurements have been left as the subject of another bulletin.

The pest was introduced into California about 1858 on vines imported by settlers from the eastern part of the United States, where it is a native, or about the time it reached France, where the first evidence of its activity was vaguely noted in 1862. It has since spread throughout most of the grape districts of California wherever conditions have been suited for it, but has never assumed such disastrous proportions as it did during the first years of its ravages in France. It is estimated that since its appearance in California, or during a period of 60 years, it has destroyed about 75,000 acres of grapes. It has in many cases been distributed through the agency of infested rooted vines imported into uninfested districts or vineyards, while in other cases it has been carried on vineyard material. Its modified life cycle in California, that is, sterility of the winged form, coupled with topographic barriers, consisting of mountain chains and dividing valleys, has prevented the rapid distribution in the state which took place in the vineyard districts of France.

Vines attacked when young, before their rooting systems have become established, will succumb more rapidly than those infested at a later age. The first indication of its presence in a vineyard occurs in the form of one or more stunted vines and in the premature yellowing of the foliage. Gradually more and more of the surrounding vines are affected, and those first infested become very much weakened or die outright. Following the initial infestation of a vine under favorable conditions for phylloxera, the pest multiplies rapidly and within two or three years increases its range to involve the entire root system. The phylloxera which settle on the growing rootlets form fleshy lesions or swellings, termed nodosities. In a great majority of instances further apical growth of the rootlet is stopped, and the rootlet ceases to supply nourishment to the vine. Other phylloxerae settle on the older roots, and in most cases cause swellings termed tuberosities, which vary in size, the majority being about 0.2 in. in diameter. The bark of the root often cracks longitudinally, and a chain of swellings arises from phylloxera punctures. So long as these swellings remain fresh, the health of the vine is not much impaired, but as soon as they decay the vine is injured. When they decay in numbers the roots are frequently destroyed, causing first the stunting and then the death of the vine.

"The diffusion of the phylloxera is effected in nature by the wandering newly hatched larvae of the radicicoles during summer and autumn. These pass from vine to vine, either on the surface of the soil or through subterranean cracks or pathways. They may also be borne by the wind or on vineyard material, such as picking boxes. Probably water is responsible for some diffusion in hilly or irrigated vineyards, and cultivating instruments, by picking up pieces of infested root, may effect fresh infestations. The phylloxera is easily introduced into a vineyard or section by the practice of planting infested rooted vines to make up for cuttings which did not succeed in previous years."

SAN DIEGO COUNTY FARM BUREAU FAIR

(Continued from Page 367.)

H. L. Vogt alone made 105 entries, winning 89 prizes, 33 being firsts, 32 seconds and 24 thirds.

The home department combined its exhibits this year, entering none on a competitive basis. The garment division of which Mrs. C. T. Ferguson is leader, the food preservation division, Mrs. Mary Gird Peters, leader, the house furnishing division, Mrs. Mary Le Stourgeon, leader, the hot school lunch division, Mrs. Ida Michenfelder, leader, all had unusual displays that attracted much interest. The food preservation division drew more than passing attention by its exhibit of home evaporated grapes, apples, figs, apricots, peaches, prunes, corn, green beans, peas, spinach, rhubarb and carrots.

The center of feminine interest, however, appeared to revolve about

Oil Light Beats Electric or Gas

Burns 94% Air

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. N. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

the remarkable showing of garments prepared by the clothing division. Far be it from a mere man to adequately describe them, but here was a bewildering display of children's clothing, hats, dresses and underwear, women's clothing from inside out, including corsets and beautiful dresses made from dyed sugar and flour sacks, street suits and hats at least one season ahead of hats bought in the shops. Miss Fleda E. Smith, home demonstration agent is authority for the statement that the women of the San Diego County farm centers wore hats last season that are just now being bought by their less fortunate city sisters, and the patterns of dresses they made last spring are but now finding their way into the city shops.

Worthy of special note in the livestock pens in the dairy class were the Guernseys from the Sycamore Ranch, San Marcos, San Dieguito Ranch, Ramona, Winsor Ranch, Bonita; Jerseys from Winsor Ranch and A. C. Whiting Ranch, Ramona; Holsteins from J. C. Broody Ranch, Palm City, and San Diego County Farm. In the beef class D. H. Ogden made an exceptional showing with his Herefords, winning 14 firsts, 2 seconds and 1 third.

Rambouillet, Shropshine and Cotswold sheep prizes were very largely taken by C. S. Bond of San Diego.

The Glenwood Ranch, Mission Valley, was awarded six first prizes, four seconds and four special prizes on Poland China hogs. Durocs were shown by the Winsor Ranch, Bonita, and a long list of prizes taken by their entrants; Berkshires and Durocs were exhibited by the San Diego County Farm and Tamworths by the Monte Vista Ranch, El Cajon.

Percherons entered by the Monte Vista Ranch received special attention from the throngs of visitors.

The attendance was, approximately, 45,000, about the same as last year, but the fair itself was an improvement over those of previous years, much better arrangements being made for the housing and showing of stock.

A distinct advance was made this year in enlisting the interest and support of the public schools, both in the matter of exhibits and contests among the pupils. The First National Bank of San Diego through its farm service department originated a "Use More Milk Poster Contest" among the school children, designed to bring out in poster form advantages to be gained by children by the use of milk. Although only a little over a week was available in which to prepare these posters, 550 were turned in from every part of the county and made an unusual showing that attracted much attention.

ANNUAL OF LOS ANGELES COUNTY FARM BUREAU

(Continued from Page 367.)

present conditions in this county. The average cow in California is better but because of the high cost of land, improvements and labor, her production would not suffice to keep the dairyman's balance out of the red. So it is necessary to find these low producers and eliminate them to insure the permanence of our milk supply, for if dairymen cannot be sure of profit they will not continue to be dairymen but will turn their capital and energy elsewhere. These records help the herdsman to eliminate his boarder cows, improve the efficiency of his herd and, by pointing out his heavy and consistent producers, indicate the lines from which he should propagate his future herd. They also enable him to see clearly the results of variations in the feed and govern himself accordingly.

"To furnish permanent records of this work the records of the monthly tests on each cow are entered and signed by the tester in a loose leaf book, each leaf being made in the form of a certificate of production with a place for a diagram of color markings for identification of the animal. It has been proven that such records have a very substantial value in selling the stock, the certificate being transferred to the new owner as absolute proof of the quality of his purchase. This form of record which was devised for our own use has proven so well suited to the purpose that it is being widely copied throughout this state and elsewhere.

"As the cow testing work increased in scope and importance we felt that other questions affecting the permanency and profit of the dairy industry should be considered by our members and the organization of the dairy department of the farm bureau was completed April 24, 1920, assuming the activities of the old association. Since that time the growth of the association has been very rapid. In the original organization one tester was employed, about 900 cows being under test. We now have three men on full time in different districts testing 48 herds containing over 3300 cows each month, nearly four times the original number. In May 1918 the average of all cows tested was 28.5 pounds fat each. Three years later in May 1921 the average production was 39.3 pounds. This is an increase of 10.8 pounds of butterfat per cow tested or nearly 38 per cent which means that by advanced methods the members of this association are producing approximately $36,000 per month or $400,000 per year more than with the same number of head at the time this work was begun. During the month of May, just three years from the start of our organization, there were 3378 cows tested which gave an average production of 981 pounds milk and 39.3 pounds fat per cow. Thirteen hundred of these cows made over 40 pounds fat apiece or 38.5 per cent of the total tested against averages of 5 to 15 per cent of 40 pound cows in other associations.

"Probably the most vital and immediate question is local control of bovine tuberculosis which was made the object of a great deal of study and discussion during the past year. In collaboration with the Milk Producers Association, the Southern California Holstein-Friesian Association and the local veterinarians society a committee of this department examined all sides of this question which is so important to both the producer and consumer of dairy products. The best method of attack on this problem seems to be through: Legal prevention of the shipment of tuberculous cattle into this county except when they are for immediate slaughter. Requirement that all cattle tested in this county and found to be tuberculous must be branded in a specified and conspicuous manner. Securing from distributors and consumers a differential price in favor of milk and cream produced in tuberculosis-free herds.

"This should prevent increase of number of tuberculous animals within the county, identify reactors now in the county for the buyers protection, and provide a real economic stimulus for the man who would not clean up his herd from other motives. An ordinance containing the first two provisions mentioned has been drafted, approved by the several organizations mentioned and presented to the board of supervisors, but has not yet been acted upon. We expect to continue this line of action until present unsatisfactory conditions are remedied."

Officers elected for the county farm bureau the coming year are: President, W. S. Rosecrans; first vice-president, Donald Graham; second vice-president, Mark Grimes; secretary, Dr. D. S. Fox, Pasadena; treasurer, Ralph McNees. Directors at large are: Volney H. Craig, Dr. George P. Clements, Robert H. Neely, Harry S. Bissell, Dr. J. H. Miller, Warren R. Schooner and director to state federation, J. B. Vaile.

PLACER FRUIT GROWERS CONVENTION

On October 11 and 12 the Placer County fruit growers will have a convention. Some of the best speakers in California will talk on various Placer County problems. Among them are Dr. J. C. Whitten who will talk on orchard management, long pruning in Placer County and injury to young orchard stock; Professor J. W. Nelson on soils and fertilizers; Professor Hendrickson on plum pollination; Prof. Ralph Smith on brown rot, sour sap; G. H. Hecke on the state department of agriculture and its relation to Placer County; I. J. Condit, standardization and naming of persimmon varieties; Professor E. O. Essig, peach worm control in Placer County; F. W. Read, standardization; Harry Smith, spraying; Gov. Wm. D. Stephens, agricultural legislation.

Motorcycling the Kids to School

Stormy weather or bad roads won't keep the children out of school when there's a Harley-Davidson on the farm. And this handiest of vehicles is cheaper than car fare, shoe leather, automobile or the "horse and buggy way".

A Harley-Davidson will serve the farmer and his family every day of the year, for years and years. For hurry-up trips to town, railroad station, creamery or neighboring farm—with the roomy sidecar full of luggage—a Harley-Davidson combines speed, comfort, economy and dependability. 50 miles for a dollar—including gasoline, oil and tires. You can't beat that for cheap mileage!

Write for free literature and see how a Harley-Davidson can save you money. Get the new Harley-Davidson prices—25 per cent average reduction on all models. Your request places you under no obligation.

Attractive dealer proposition for unassigned territory. If interested, address Desk A-2.

June Drop

From Report of R. S. Vaile and Gordon Surr to Tulare Citrus Growers

One of the prominent problems for which a solution is urgently and properly desired is the so-called June drop. The work done some years ago by Dr. Coit and Mr. Hodgson remains to date the best information we have on the general question. This work was of particular value in that it showed clearly the fact that the shedding of fruits the size of quail eggs during June and July may be caused by several very different things. It seems that some of the fruit is affected with a fungus organism (Alternaria citri) which causes it to drop. Last year a very high percentage of the fruit which shed was found affected with this organism, while this season the percentage is very much less. Last year our observations on the experiment blocks showed nearly 90 per cent infected, while this season there does not seem to be over 40 per cent. A second cause of this summer shedding is to be found in the moisture relationships that exist as between the transpiration from the leaves and the water available to the tree. Many times during hot weather there is so great a transpiration that water is drawn back from the fruit itself and transpired through the leaves. This is said to so weaken the small fruit that it drops. Summer covercrops should help to prevent this occurrence, for they reduce the transpiration requirements by lowering the temperature and at the same time raising the humidity. Measurements of the evaporation from porous clay spheres during June, 1921, showed a reduction of 17 per cent due to a covercrop at Lemon Cove, together with a reduction of three degrees in the average daily maximum temperature, taken five feet above the ground. So far the crops seem to indicate that this change in atmospheric conditions has been of value in the setting of the crop, but there is still some question as to whether the trees can be maintained in good condition with the continuous use of summer covercrops. Also, as has already been pointed out, unless there is ample water available at frequent intervals a summer covercrop may be a decided detriment. We have attempted, during the two years, to grow a few trees under cloth covers, where the atmospheric conditions could be even more completely controlled than with the covercrops. The conditions under the covers were just a little too extreme, however, for practical deductions to be drawn from them at the present time. There did not seem to be any material effect on the set of fruit the first season that the trees were covered and since that time the type of growth has been so modified that the crop might be different for this reason rather than as a result of the climatic changes.

Whatever may be the cause of the June drop the fact remains abundantly illustrated by individual examples that splendid crops of fruit may be set and matured despite this particular malady and without any attempt at its control other than careful and painstaking attention to the details that go to make up good grove management.

Walnut Growers Name Prices

Opening prices for new crop walnuts, which were named by the California Walnut Growers Association on September 28, reflect better financial returns for the entire crop than were enjoyed by the growers last year. The estimated tonnage is approximately the same as it was last year and prices are ten per cent higher than they were then. Opening prices to the wholesale trade are: No. 1 Softshell, 24½ cents; No. 2 Softshell, 17½ cents; Standard Budded, 28½ cents per pound.

The crop is estimated by Sales Manager W. T. Webber at nearly 40,000,000 pounds. Counting the meats which will be obtained from low grade walnuts, he figures that the crop is worth between $11,000,000 and $12,000,000.

While the strength of the market would appear to justify higher opening prices, General Manager Carlyle Thorpe, who returned from a complete survey of Eastern market conditions about a month ago, believes that the prices just announced are altogether in keeping with sound business and are such that the crop should be sold out promptly and go into ready consumption. He says:

"It should be borne in mind that a pound of walnuts is not sold until it is eaten and the public will not eat walnuts unless it regards the price as being fair. Today the wholesale price of all food products combined is 33 per cent lower than at the corresponding time last year. When the price strikes the consumer as being too steep for his pocketbook, regardless of what the wholesaler or retailer may be willing to pay, the consumer simply refuses to buy and the walnuts pile up on the dealers' shelves.

"The walnut production in this state has been doubling itself every four years and foreign competition has grown to the point where, if California walnut growers are to dispose of their crops they must adhere to sound business principles and secure the widest possible distribution of the product.

"This season the buying power of the country is not as strong as it was a year ago because there are 5,750,000 unemployed people in this country, most of whom were earning good wages a year ago; and the fact cannot be overlooked that the laboring classes are good spenders. The ten per cent increase in prices more than offsets the slight crop shortage which is statewide, and it is my belief that the growers, most of whom are business men, are well pleased with the association's opening quotations."

FRUIT GROWERS AND FARMERS CONVENTION

The 54th annual convention of the California Fruit Growers and Farmers will be held in Los Angeles October 24 to 26, at Expositon Park, under the auspices of the state department of agriculture.

The great problems confronting the fruit growers and farmers will be discussed by eminent authorities, including Secretary of Agriculture Wallace.

President Teague and Manager Powell of the California Fruit Growers Exchange will discuss agricultural legislation and the failure in distribution of agricultural products.

At a banquet which will be given Tuesday evening, October 25, Governor William D. Stephens will be guest of honor. Governor Stephens will deliver an address on "Agriculture as the Basis of Prosperity."

The subject of water transportation for shipment of fruit and other perishable products, will be one of the subjects under discussion, and will attract the attention of railroad officials and others in various parts of the country, as well as one of the commissioners of the United States shipping board.

Horticultural Commissioner Ryan and Farm Adviser Hodgson of Los Angeles County, Dr. Clements of the chamber of commerce, Henry Musser and James P. Britt of the state department of agriculture, have been named as a committee to take charge of the details of the convention.

The California Flower Show will be held at the same time and place.

SACRAMENTO COUNTY OLIVES SELL AT $100

The recently formed Fairoaks, Sacramento County, Fruit Growers Association announces sale of 50 tons of green olives from the groves of 22 members for $100 per ton. It is expected that 150 to 200 tons more will be sold for the same price at an early date.

Secretary G. L. Camden says the association was organized to handle citrus and deciduous fruits, but that the olive being a slow seller, it was to confine its activities to that fruit this fall.

The association controls about 300 tons of olives and growers recently have been refusing offers of $75 per ton, which buyers said was the limit they would go. The association took hold and succeeded in making sales at $100. The olives were sold for consumption by the foreign element in the East and will be processed.

Officers of the new association are: C. E. Weikert, general manager; Dr. S. W. Cartwright, treasurer and G. L. Camden, secretary.

WHAT ARE "FRESH CLEAN SACKS?"

Quarantine Officer Vary of the state department of agriculture is sending out letter of notification.

Several inquiries have been received as to the definition of the term "fresh, clean sacks," used in Regulation 3 of Quarantine Order No. 34, which pertains to the movement of potatoes from alfalfa weevil infested areas into California. I am advised by L. A. Strong, chief quarantine officer of the state department of agriculture, that hereafter only new sacks from the original bale will meet this requirement. Potatoes from alfalfa weevil areas arriving in sacks other than new sacks, as defined above, will be held in quarantine by this department until requirements as specified in this regulation have been complied with.

HARDY AVOCADO

A variety of avocado, the fruit of which attains a weight of 18 ounces and the trees of which will stand some frost, has been sent to the office of foreign seed and plant introduction, United States department of agriculture, by Wilson Popenoe, plant explorer in South America, and buds of it are now growing in the department greenhouses. Curiously, the new avocado, hardier against cold than the ordinary West Indian and Guatemalan varieties, was discovered in Ecuador. The region, hitherto unknown as producing this fruit, is in what is known as the Chota Valley, 6,000 feet above sea level, giving a climate comparable to many regions much farther north. Most of the fruits of varieties of this Mexican race are small. This one has fruits comparable in size with those of the more tender races. Regions occasionally visited by a temperature of plus 18 degrees Fahrenheit have produced bearing trees of the Mexican avocado.

HUMUS FOR CITRUS

On the W. J. Worsham ranch near Covina a liberal application of strong barnyard manure was made two months ago. The cost was five dollars a ton spread in the orchard. This was plowed under, and now straw is being given, a bale to a tree, which cost $10 a ton, delivered but not spread. As the manure had a fertilizing value and contained enough nitrogen to keep the beneficial bacteria busy, the straw was applied solely to provide humus. For such use it is considered the cheaper, though the cost per ton is more than twice as much, for a ton of dry straw contains three or four times as much organic matter as the damp manure. Though the orchard trees are in good condition, the leaves are not quite so large or of as good color as they should be, so the orchard will later be subsoiled and an application of lime made.

EXTENSION SCHOOL FOR BEEKEEPERS

An extension school for beekeepers will be held in Los Angeles December 5 to 10 inclusive. This will be an advanced course of instruction for commercial beekeepers and will include such subjects as winter and spring management, diseases, queen rearing and swarm control. The program will be provided by the division of entomology of the state college of agriculture and will include prominent apiculturists from the state university, the federal department of agriculture and other institutions. As soon as the location has been selected the complete program will be announced.

Farm home department meetings will be held in Kern County at Shafter, October 11; McFarland, 12; Arvin, 13. Farm home department committee, 15; Weed Patch, 18; Inyokern,, 21; Kern Delta, 25; Wasco, 27; Edison-Fairfax, 28.

A preservative for YOUR roof

Examine your shingle roof. It needs protection against the heavy weather that is coming.

ORONITE SHINGLE OIL
Preserves Shingles

Shingle roofs had a hard battle last winter. Drenching rains and sharp, whipping winds cause moisture and air to penetrate the fibre of unprotected shingles, and start disintegration and decay. The natural oils in the wood of unprotected shingles evaporate and cause cracking and warping—soon you have a leaking roof.

Use Oronite Shingle Oil—on old or new roofs to protect them against the elements and assure longer service from them. Oronite Shingle Oil is a high-quality preservative for all shingles—on roof or side walls. It penetrates the shingle fibre with a *moisture-resisting* preservative. It retards the evaporation of natural oils in the wood and counteracts the effect of age and exposure.

An application of Oronite Shingle Oil *now* may save the heavy cost of a new roof next season. Oronite Shingle Oil will put your shingle roofs in condition to stand up under another winter's heavy rains.

A gallon of Oronite Shingle Oil will cover from 80 to 100 square feet of shingled roof, according to the age and condition of the wood. Oronite Shingle Oil may be mixed with colors to make an attractive finish. Ask our nearest agent for formulas.

OTHER QUALITY PRODUCTS

especially prepared for use on the farm.

Oronite Roof Paint

A high-quality protective coating for prepared roofing and metal roofs.

Mica Axle Grease

Gives a durable, smooth lubricating film under every pulling condition. Keeps the axle cool; no hot-boxes, no gumming. The MICA makes it better.

Eureka Harness Oil

Preserves the original strength and life of leather and keeps it soft and pliable. Keeps harness "new looking."

Standard Hand Separator Oil

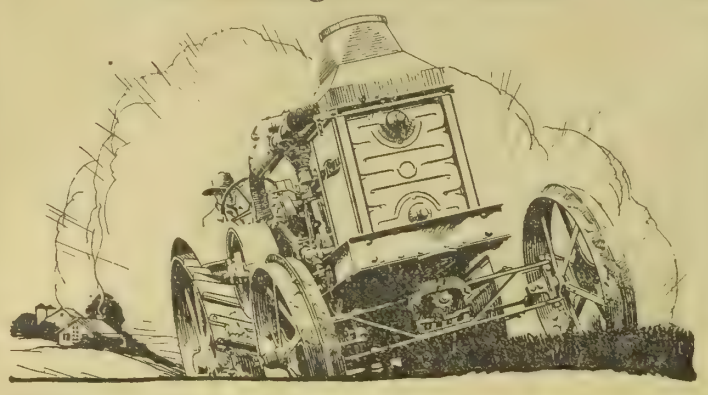
Correct Lubrication for your Hand Separator, under the conditions of high speed and close fitting parts.

STANDARD OIL COMPANY
(California)

ORONITE *means* QUALITY

Plows on 30% Less Fuel Than the Average

This record was made by our OilPull in the recent Official Tests at Fargo, North Dakota



OilPull performance proves without doubt that a perfected oil burning tractor is the most efficient and profitable power for the modern farm—that it cuts the cost of producing crops. Horses are not to be compared with the perfected OilPull Oil Burning tractor. OilPull success is due to three features that are absolutely essential to dependable power at low cost. These are: (1) Low Fuel Cost, (2) Low Repair Cost, (3) Long Life.

Consider These Facts:

For nine years an OilPull tractor has won leadership in all official public tests for low fuel consumption. No tractor has ever equaled its fuel economy records. Again this last summer in the Official Tests at Fargo, North Dakota, in competition with practically every prominent tractor, an OilPull 12-20 was victorious. The mark established was only 2.325 gallons of kerosene per acre plowed. This was 8% less than the average of the six lowest scores and about 30% less than the average fuel consumption among all the kerosene tractors. *It proved that the OilPull will plow an acre cheaper than any other tractor.* In preparing the seed bed, which included discing, seeding and dragging, the OilPull consumed only .85 gallon per acre.

Low Repair Costs and Long Life

Such amazing figures as less than $17.00 per year for repairs are convincing. A recent investigation disclosed this low average among 500 OilPulls of all ages.

As for long life, hundreds of OilPulls are still at work after 8, 9, 10 and 11 years of service.

Everything that makes a tractor practical you find in this perfected OilPull. Investigate it thoroughly. If you cannot come here, write for a man. You ought to know all about this perfected oil burner.

RUMELY OILPULL TRACTOR

Advance-Rumely Thresher Co., Inc.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pressing Wild Flowers

At the recent state fair at Sacramento, in the Placer County exhibit I saw an exceptionally fine portfolio of native wild flowers and plants, pressed very flat and the natural colors well preserved. Can you tell me how best to treat such material? — Subscriber, Vacaville.

To gain best results the plants and flowers must be dried as quickly as possible. The professional sheet for mounting such material is 11½ by 16½, and all dryers, blotters, presses, etc., should conform as nearly as possible to these dimensions. For best results place fresh specimens between sheets of porous or uncoated paper, the poorest news paper is good, although that without ink is better—it is a matter of getting the greatest porosity. Do not place material between blotters or latter will soon get gummed and stained and become nearly or quite valueless. After specimen is between folded sheet place the latter between two sheets of the best blotting paper you can get. Build up a pile of as few or many as you wish, first a blotter, then a sheet of plants, another blotter, etc. On top of this place heavy weights, as heavy as you wish. Professionals change blotters once a day at first and less often as material dries, but the more often blotters are changed, especially at first, the better will the natural colors be preserved. Much depends on water content of material. Some people change blotters on succulent material as often as they become moist, perhaps four times a day. See that blotters are well dried before using again. Always place material in hottest sun. The results will be according to care given. Mount finished specimens on the purest white paper or bristol board.

Planting Lawn Grass

When is the best time for planting lawn grass in the San Joaquin Valley? —Subscriber, Hanford.

During the next month is a good time for starting a lawn. If one is careful in sprinkling frequently, two or three times a day if possible, the lawn should get well established before the cooler weather of November. It should then be protected so far as possible from tramping or wear during the winter months, then the first warm days of late winter will bring it along very satisfactorily.

Replacing Peach Trees

I have a 14 year old peach orchard in which some of the trees are dying. I want to replace them with new ones and would like to know if it would be safe to pull them out now and leave big holes until spring time and then plant in those holes the new trees? —Subscriber, Turlock.

This replacing of old trees is difficult. In the first place the old established trees surrounding the younger ones will be so greedy of moisture that the young trees will not have a good fighting chance. Besides, the fungous and other troubles which may have affected the roots will exist in the soil for a longer time than the few months referred to and this might prove a determining factor in the success of the newly planted trees. If possible to rotate and put in alfalfa or potatoes or some other crop for a few years we believe the orchard could be made over into another orchard probably of great value. This, however, is a long question for with several hundred dollars invested in each acre most farmers are hardly in a position to wait patiently for soil conditions to be corrected according to nature's way. This question is one of such importance that we would be glad, indeed, to hear from any subscriber of the Cultivator who had had experience in the making over of his orchard or, rather, of planting one orchard where another has just been removed. A year's subscription to the California Cultivator, either new or renewal, will be given for every such answer which we may be able to use in our columns.

Cockroaches

I have a cement cellar with cement floor and large wide shelves all around to keep fruit cans, etc. I put 12 iron pipes through the cement near the top of walls on all sides and put screen wire over ends and tied on with wire on the inside to keep out anything. Now there is some kind of stinking bug with hard shell. Doesn't fly much, but can, and scurries from under every lifted object. Is there any way to kill them or make them leave? The cellar is perfectly dry.—Subscriber, Corning.

Presumably these are cockroaches, one of the worst pests, for they are voracious feeders, will destroy food or almost anything they can get access to. They are not very easy to dispossess. The simplest remedy is to thoroughly dust cracks or places inhabited by them with buhach or common insect powder. If this is applied freshly each day or two they will soon leave in disgust. In addition they have a working mate known as the croton bug. This is somewhat smaller than the cockroach and inhabits wet places, especailly if the plumbing is leaking and surrounded by decaying wood. Removing the moisture is the way to handle this fellow. We are not certain but we think that if the milk pans are surrounded with a very light sprinkling of the insect powder the pest will not trouble the milk.

Ventilating Cellar

My cellar is always hot, doesn't keep anything cool as a cellar should. It is 10 by 12 by 7 feet high. I am going to build and want to know if I put a tin pipe from cellar up through roof of kitchen if that would give circulation of air.—Subscriber, Corning.

It is rather hard not knowing more of the circumstances to give answer of much value, but we would suggest for a new building the ordinary cool food cupboard now built in most modern houses. This, of course, has to be open at bottom and top with shelves made of one-fourth inch mesh wire. The air from the cellar rises through this cupboard which usually has an outlet above the ceiling of the upper floor. To be satisfactory such vent must be supplemented by thorough ventilation of the portion between garret and the roof or ceiling. This is accomplished by slat construction at gable ends of the house. This permits sweep of air through the upper portion of the house and aids in drawing warm air from cellar. This cooler may be 12 or 14 inches square or even two feet.

Learning Pruning

Please refer me to some one to prune an apricot tree and peach and a Satsuma plum. I have 2,000 apricot trees and if informed I can attend to the pruning myself. — Subscriber, Palms.

Your county farm bureau will without question stage a number of pruning demonstrations the coming season. The best way will be to attend these demonstrations and learn the latest on "long pruning" as well as get in touch with practical pruners. We would suggest that you get one of the best qualified pruners to aid you in pruning your entire orchard at least the first year. The experience should then be of great value in other years' work.

Grafting Figs

When is the best time of the year to bud or graft over a fig tree, and how would one graft it so it would bear larger fruit, just as you would a walnut tree, or is there a different way to go about it? — Subscriber, Puente.

Grafting of figs should be done in dormant season. Information as to methods is given in the California

Cultivator of May 14, 1921, copy of which is mailed to inquirer's address.

Peach Pits for Seed

What are the best peach pits for planting in nursery for stock for budding?—Subscriber, Pomona.

See answer to El Cajon subscriber on page 351 of last week's Cultivator.

Budding Walnuts

What is best time for budding walnuts?—Subscriber, Pomona.

Walnuts are usually grafted. This is done in months of February or March, according to season, care being used to graft just before starting of growth. Details of the work will be given in the Cultivator a few weeks in advance of grafting time.

Transferring Insurance

A sells house and lot to B shortly after insuring house for three years. Nothing said at time of purchase about insurance. What would be fair, morally not technically, in such cases —A to receive back part of the insurance he had just paid, or does he get nothing back on the insurance from which B benefits?—Subscriber, Turlock.

This is hardly a legal question for it is more a matter of understanding or agreement between the two parties. Technically the one who sold the place can go to the agent and cancel the insurance, asking for the shorter term rate and receiving in cash the difference. Ordinarily in sale of buildings the insurance is transferred. It is of no value, however, if allowed to stand in the name of the original insurer, for once title has passed, according to the terms of standard forms of policies, the insurance can not be collected in case the building should burn. In case of sale in order to secure protection to the purchaser the transfer should be immediate or else it should be cancelled and a new policy taken out in the name of the purchaser.

Orange Trees in San Joaquin County

Where can I secure orange trees that will grow in sandy soil in the northern part of the state? — Subscriber, Ripon.

Any nurseryman advertising citrus trees in the columns of the Cultivator can supply the trees. It will then depend on local weather conditions as to whether success may be had. That is, there are some portions of San Joaquin County which may prove a little too cool for best results in citrus culture. However, there are orange trees growing in nearly all sections of San Joaquin County. In the cooler or more exposed situations it would probably be best to protect the trees during the first few years of growth by surrounding them with some protector which would prevent frost injury. This is often done in some sections where orange culture is important commercially.

Mottle Leaf

Am sending leaves of orange trees affected with mottle for which I would like to know the cause and remedy, if any. Some say too much fertilization; some, water. I have been using barnyard manue, fish tankage and cover crops. I water every five or six weeks, have good drainage. I use 75 inches on eight acres about 36 hours. Now if anyone can give me the information I would be very grateful.—Subscriber, Fillmore.

This matter of mottle leaf of citrus trees is decidedly complicated and no intelligent answer can be given at long range. As the inquirer suggests, some say too much of this or too much of that, while others find the reverse to be true, and presumably both are right. That is, mottle leaf is not a disease but an indication of disease or an improper physical condition of soil or something which only close observation and knowledge in treatment can help in solving. Apparently this soil is well cared for, if good heavy cover crops have been plowed under the ground should be light, and the addition of commercial fertilizer has probably carried a sufficiency of fertility. Ordinarily we believe watering every five or six weeks is sufficient, but possibly this soil is not of the type which will hold water that long. In that case frequent irrigation might be beneficial. Some of our other citrus culturists may have some suggestions for the Fillmore inquirer. Let us have answers. How may we prevent or cure mottle leaf?

Bleaching Walnuts

Will you please advise me as to the proper method or process for bleaching English walnuts.—Subscriber, Visalia.

24 pounds chloride of lime and 6 pounds monohydrate crystals of soda to 50 gallons of water; the monohydrate dissolves in cold water while sal soda has to be boiled. By sulphuring very lightly after dipping while the nuts are still wet with the solution, a much whiter nut is secured.

Foreign Plants

Can any one obtain foreign plants and seed by writing to our ambassadors or ministers? What is the proper procedure?—Subscriber, Modesto.

We think the ambassadors and consuls in foreign countries are not able to secure seeds for private parties but do join in securing seed for the department of agriculture which sometimes distributes these seeds or cuttings. The best way to get information regarding that is to write Bureau of Plant Introductions, Department of Agriculture, Washington, D. C. One should give the department information as to the kind of seeds or plants desired and describe conditions under which they will be tested so that the department may know that conditions are favorable to the growth of the plants. The quarantine regulations are such that it will be very difficult for one to have plants sent to this country from foreign dealers or growers.

ORANGE COUNTY FAIR

By Ernest Braunton

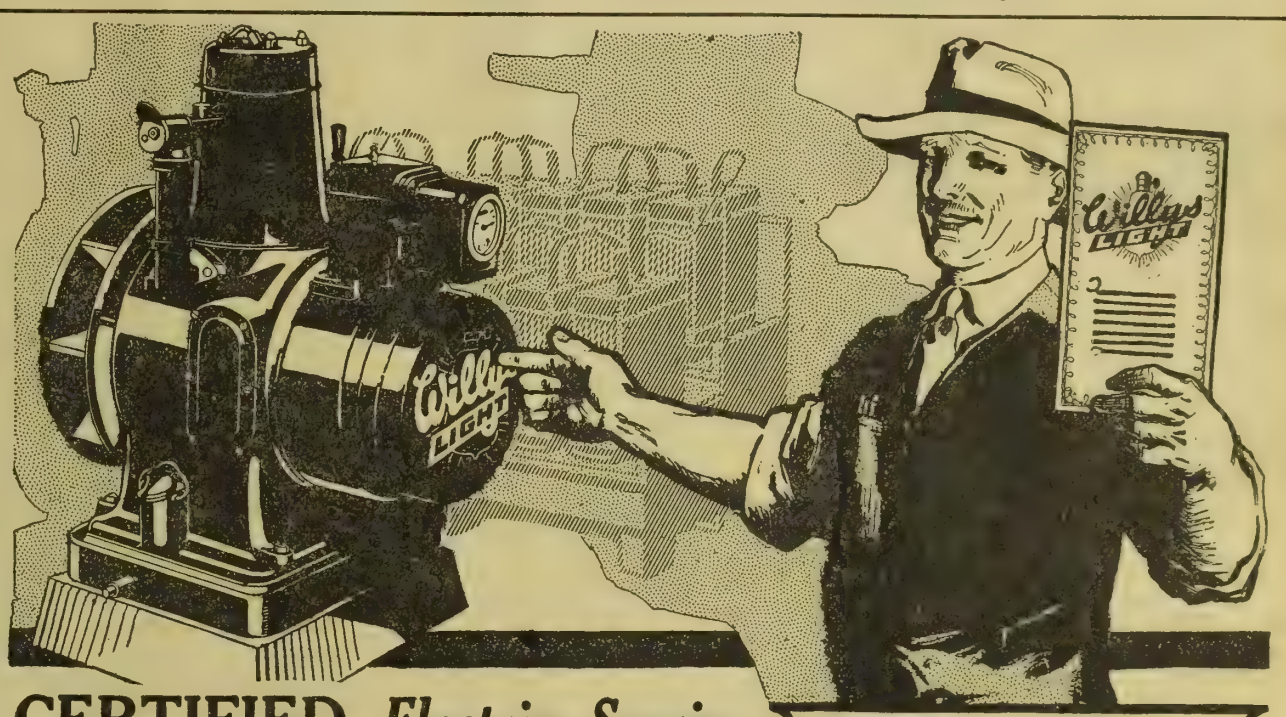
The dominating feature of the Orange County Fair was the farm bureau exhibit as it had taken the eight central booths nearest the main entrance of the agricultural tent and installed in each a branch or department of the bureau, such as "Poultry Department," "Beekeepers Department," etc., etc., and such signs in large letters hung over each booth. It was a great exhibit of the scope of farm bureau activities and of its accomplishments, and Farm Adviser Wahlberg must have been preparing for it during the whole year preceding.

Much of the remainder of the main agricultural tent was given to community exhibits, and any section of like area would have to dig deep and search soundly to find as fine and variable an exhibit as that shown by Garden Grove. It would seem as though every fruit and vegetable that soil could grow had found a place in and about this booth. At the entrance was staged field corn whose three ears to the stalk were ten feet from the ground, too far up to be harvested except the stalks were cut down, too high to hear what is going on in the world of man; and two ears are enough for anyone but an Orange County farmer. Inside was a range from the oily avocado to the fiery chili pepper.

Every community, town or section of the county had its booth and in every booth a great variety of crops was shown. It was noticeable that hardly a booth but contained avocados and doubtless no county can better grow them in all parts. In one booth a branch hung heavy with grape-like clusters of little Mexican seedling avocados about an ounce in weight, while their great "show piece" was a stock pumpkin weighing 120 pounds.

A fine exhibit of apples was shown from the Costa Mesa that would score high in a state district exhibit. Aside from the new crop were several varieties that had been in cold storage for ten months. The writer saw one box of these unpacked (Pearmains) and there were but six apples in the lot of at least 70 that showed even the slightest bruise, injuries evidently suffered previous to being placed in the refrigerator plant.

Major stock ranges of Arizona and western New Mexico are the best in ten years, according to forest supervisors and others in a position to observe conditions. Aside from excellent pasture at present grass seed has fully matured and will cover the ground with the heaviest seeding it has received in years.



CERTIFIED *Electric Service*

With Willys Light Certified Service, all guesswork, all uncertainty all risk is eliminated. When you buy Willys Light, you receive electric power equipment specified to fit your particular needs, and sold to you for continuous, dependable, year-in-and-year-out performance at a price suited to your requirements.

On this basis, Willys Light will assure more profit in cash and comfort than any other investment you can make in farm equipment, and removes all question as to the utility of electric light and power on your farm.

On thousands of farms work is lighter, homes are brighter, lives are happier, and the expense is lower—because of **Willys Light Certified Electric Service.**

Twenty-four hours a day, winter and summer, in the house, in the barn, in the yards and out-buildings, Willys Light supplies strong, steady, cheery light—an abundance of power that banishes the drudgery of tedious jobs and gives the wife the household conveniences that make life worth living on the farm.

Get the facts about Willys Light Certified Service. Find out for yourself how Willys Light pays its way—how reliable and economical it is—how it shortens chore hours, brightens pleasure hours, and brings the most desirable comforts and conveniences to every member of the family **at a yearly cost so low you can no longer afford to do without it.**

No matter where you live or what the size of your place, you should get full information and **free estimate** of complete cost for plant and installation. Telephone or call on the Willys Light dealer in your locality, or write for free catalogue and illustrated circulars today. Address Department 79.

WILLYS LIGHT DIVISION
Electric Auto-Lite Corporation, Toledo, Ohio
Builders of over 3,000,000 electric lighting systems for farm homes, stores, yachts, Pullman cars and automobiles.

WILLYS LIGHT

Power and Light with the Quiet Knight

Take the Word of Men Who Know

Ask any one of the thousands of Willys Light users.

Such proof is undeniable — such facts are evidence upon which you can bank, without fear or risk.

Take, for instance, the statement of Alex Jefferys, Owensmouth, Cal., who says: "The Willys Light has not been out of order a day since I installed it—it is very practical and I highly recommend it."

—or C. H. Phamvekuchen, Ritzville, Wash., who says: "My Willys Light is certainly a great thing, giving me every convenience of a city home on my farm. The convenience of lights in the barn is wonderful. I wouldn't take twice the cost of the installation and do without Willys Light."

—or J. W. Rasor, Medimont, Idaho, who says: "Have found Willys Light very satisfactory. Would not go back to the old way of lighting."

There is a size to fit your needs—as much or as little power as you may require.

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Even If You Could "Coast" EVERYWHERE
In the Old "Bus"
It Would Cost You More Than
Pacific Electric Fares

The Gas you burn is only a small item in your total cost of operation. Add to that the cost of oil, rubber, repairs and depreciation in the value of the machine, and see "where you are getting off."

The Government says it is costing you from 9c to 14c per mile.

You can ride the Pacific Electric way for 3c per mile for the occasional journey and for about 1½c per mile for the frequent (commutation) trips.

"CAN YOU BEAT IT?"
YOU CAN NOT!

Ask any Pacific Electric Agent for the Commutation Fare on tickets best adapted to your travel needs. He will show you the true way to travel economy, and you do not carry the accident risk.

Household Department

DREAMS

I know a hill where the heather blooms,
Where the wind of Heaven blows free;
Where the sky on high is a blue, blue sky,
Which smiles on a Summer sea.

I know a spot where the sunshine breaks
On a world that is half asleep;
Where the sad waves sigh as the day goes by,
And over the bright sand creep.

I know a dream which is mine all day,
And haunts me the long night through;
It is sky and sea and a wind that is free
And the sun and the heather and you.
—Irene Styles in London Answers.

THE TRIAL OF FIRE

A Mock Trial Staged with a Certain Amount of Poetic License.

SCENE, Court Room—There should be a large chair and table for the judge's bench if nothing more accurate is available. There should also be a chair and table for the clerk of the court, a witness chair beside the judge's bench and chairs for the twelve jurymen and spectators. Various pupils should be designated to represent the different fire hazards.

The use of special costumes is optional. These may easily be constructed of cardboard, cloth or otherwise. However, it will answer every purpose to hang placards about the necks of the pupils.

Dramatis Personae—The Judge, the District Attorney, Court Officer, Counsel for the Defense, Clerk of the Court, the Jury.

The Defendants—Kerosene, Cigarette, Match, Electricity, Rubbish, Defective Chimney, Gasolene, Bonfire. The Arch Criminal, Carelessness.

The Judge enters after all have assembled. The different defendants (the hazards) are led in by the Court Officer. Everybody stands as the judge enters.

Clerk (standing): Oyez, oyez. All ye who have business with this honorable court draw near and present your petitions. (No one moves. He continues): The first case on the docket is that of The People vs. Fire.

Judge: I assume that the formalities have been observed.

Clerk: Yes, your Honor.

Judge: Are the Counsel ready for trial?

District Attorney: The People are ready, your Honor; the defendants should have been brought to trial years ago.

Judge: Who is appearing for the defense?

Counsel for the Defense (rising): I am, your Honor. I wish to say that there are nine defendants involved in this action. Each defendant will speak for himself.

Judge: Very well. We will proceed. (Looks at paper.) I see that Kerosene is charged with having wilfully caused the death of a little girl and boy and the destruction of their home. Clerk, call the defendant.

Clerk (calling) Kerosene to the bar.

Judge: Kerosene, you have heard the charge, what is your plea?

Kerosene: Not guilty.

Judge: Have you any witnesses?

Kerosene: I am my own witness.

Judge: Clerk, swear the witness.

Clerk: Do you solemnly swear that you will speak the truth, the whole truth and nothing but the truth, so help you God?

Kerosene: I do.

Judge: What have you to say for yourself?

Kerosene: May I tell how it happened in my own way?

Judge: Yes, go on.

Kerosene: I was enclosed in my usual container, your Honor, waiting to be of service and doing no one any harm, when the little girl came into the kitchen, took me up and poured me into the kitchen stove because she thought the fire was not burning fast enough. It was not my fault, your Honor, that I was kept in the kitchen where I had no business to be; it was not my fault that the child was allowed to handle me and I could not help myself when I touched the flame; I flashed back, of course, exploded the can and burned the little girl to death. I also burned her brother who was playing nearby on the floor. There would have been no fire, your Honor, if the family had been careful and the children had not been allowed to play with fire.

Judge: I recognize the truth of your story, Kerosene, and dismiss the case against you. (Kerosene takes seat at one side.)

Judge: What is the next case?

Clerk: It is all part of the same case, your Honor; the next defendant is Cigarette.

Judge: If there are many more defendants in this case swear them in at once.

Clerk (turning to pupils representing hazards): Do you solemnly swear that you will speak the truth, the whole truth and nothing but the truth, so help you God?

Chorus: We do.

Clerk: Cigarette to the bar.

(Cigarette comes forward.)

Judge: Tell us just what happened.

Cigarette: I was in a man's pocket in a warehouse, your Honor, where a dangerous chemical was being stored. The man knew it was against the rules to smoke me, but he was reckless and "took a chance." When I was almost consumed he threw me on the floor and this ignited some of the chemical scattered about and caused it to explode the entire storage. The damage amounted to $2,000,000, but it was not my fault. I cause fires only when used by careless people.

Judge: Step down until we hear some of the other defendants.

Clerk: Is Match present? (Match steps forward and takes the witness chair.)

Match: Somebody threw me on the floor, your Honor, and a little child found me and used me in play, because she did not know that I was dangerous. First she ignited the curtain at the window and then her own clothing. They took her to the hospital and she may recover, but if she does, she will be disfigured for life. I was not guilty of any wrongdoing and the accident would not have occurred if I had been kept out of the reach of small children.

Judge: Take your seat until we hear the rest of the witnesses. Call the next one, Clerk.

Clerk: Electricity, take the witness chair.

Judge: Your record is a bad one, Electricity. You started out in life with great opportunities for service, but you seem to have "gone wrong" until you have become the chief cause of fire in the United States. Every year you destroy millions of dollars' worth of property. What is the reason?

Electricity: Your Honor, I have been basely used. I possess tremendous power, but nevertheless, I am harmless if properly installed and kept within bounds. I should be insulated against chance contacts and my wires should not be given too much to do. I was haled into court, your Honor, because I overheated an electric flatiron and set fire to a newly built home. I burn many other homes in the same way every day, but it is not my fault, your Honor. When I am once put to work I have to continue until I am switched off, but people forget and leave electric irons and other heating devices in contact. Consequently, these devices grow hotter and hotter until they ignite the nearest combustible material and soon there is another fire. Sometimes this occurs at night and causes loss of life, and yet engineers call me the safest known form of power and light, when properly used. If people would only be careful instead of careless in using me, there would be no cause for complaint. (Electricity steps down and takes former chair.)

Clerk: Rubbish is among the defendants, your Honor.

Judge: Very well; call Rubbish.

A Bathroom Five Feet Square

Perhaps yours is a home where another bathroom would add much to comfort and convenience. No longer need limited space handicap you.

The illustration shows "Standard" Plumbing Fixtures installed in a room only five feet square, making a *complete* individual bathroom.

A small space partitioned off—a large closet utilized—and a similar arrangement can be yours.

See your Contracting Plumber or write for catalogue, "Standard" Plumbing Fixtures for the Home. "Standard" Plumbing Fixtures in this bathroom are: 5-foot Pembroke Bath with Shower, Marcosa Lavatory and Expulso Closet.

Standard Sanitary Mfg. Co., Pittsburgh
San Francisco, 149-55 Bluxome St. Los Angeles, 216-224 S. Central Ave. Seattle, 1714 L.C. Smith Bldg.

(Clerk beckons and Rubbish advances to the chair.)

Judge: I find that for a good many years you have been hanging around corners and have become a thoroughly undesirable citizen.

Rubbish: I was once a man of parts, your Honor, but now I am only part of a man. I am made up of odds and ends from here and there and have no will of my own. If people realized how dangerous I am, because I furnish fuel for the chance spark and often ignite spontaneously, they would not have me around; but I find plenty of cellars and attics to sleep in where the careless housekeepers never disturb me and I stay there until I catch fire. I sometimes have to wait years, but the older I am the better I burn. However, I am not at fault, your Honor, because I cannot remove myself.

Judge: You have said a good deal, and it is not all rubbish. (To Clerk) Call the next defendant. (Rubbish resumes former chair.)

Judge: I believe that Defective Chimney is closely involved in fire troubles. Where is he? (Clerk beckons to Defective Chimney.)

Kerosene, Cigarette, Electricity, Defective Chimney, Bonfire, Carelessness

Judge: I am given to understand that you cause a great many preventable fires.

Defective Chimney: Yes, your Honor, I do. Many contractors do not build me properly. In some places they support me upon brackets instead of building me up from the ground. Sometimes they build me only one brick in thickness, and, still worse, construct me with my bricks on edge instead of flat; consequently, I develop cracks through which sparks escape and cause fire. Frequently, the sparks fall upon the roof, and when it is made of wooden shingles there is likely to be another home burned up. Sometimes the cracks are under the roof and the sparks fly into the attic which is a dangerous place for a fire to originate. Careful construction, your Honor, as set forth in the Standard Building Code, is the only remedy. (Defective Chimney takes former chair.)

Judge: The name of Gasolene is next.

Clerk: Yes, your Honor, I will call him. (Beckons and Gasolene takes the witness chair.)

Judge: Gasolene, you have made a place for yourself in good society and I am shocked to find that you are charged with countless fires.

Gasolene: Yes, your Honor, I am forced to admit that this is true, but it is due to the fact that the average citizen does not realize my power. I have killed many people and started thousands of fires because I am volatile and flash up upon slight provocation. Housewives sometimes use me for cleaning purposes in their homes. The moment I am free my vapor starts about the house looking for a flame or a spark. Presently I find it and, pouf! I cause a terrific explosion. Not long ago I killed a California woman because she used me to clean her silk waist. The rubbing of the silk caused a spark, which was all I needed. With automobiles in every highway and byway, nowadays, I have become almost as common as water; yet men will smoke around filling stations and then wonder why there are accidents. I work hard for humanity and am, your Honor, reasonably safe when properly handled. I am more dangerous than dynamite, however, when carelessly used, for it takes but a little spark to set me off.

Bonfire: Grown people as well as youngsters often start me, your Honor, and by doing so they frequently cause serious loss of life as well as of property. I am always potentially dangerous and seldom necesasry, except to destroy rubbish, but when I am, I should be confined so that I cannot scatter sparks. A bucket of water or some other extinguisher should be at hand to keep me within bounds. There was a man in Alabama who forgot my possibilities, and one day, when there was a high wind, lighted me in order to burn up some old chicken coops and trash. There was a wooden fence nearby as well as a frame garage, and before I got through 191 buildings were destroyed. Nevertheless, I plead not guilty, your Honor, because I do not start fires unless some careless person starts me. (Resumes former seat.)

Judge: The Counsel for the Defense may now put in his rebuttal.

Counsel: I move, your Honor, that this case be thrown out of court on the ground that proof of guilt on the part of the defendants has not been established. These defendants, your Honor, are for the most part tools—involuntary tools of man. When rightly used they render him great service, for they are mighty, but the power to serve is generally accompanied by the power to harm. I maintain that the testimony of each of these defendants shows complete absence of intent. They act as they have always acted and as they always will act under such conditions.

Man understands their nature; when he gives them their opportunities he knows, if he will stop to think, what the result must be. Therefore, why blame them for what they cannot help? Why not bring to trial the real culprit, Carelessness, who alone is responsible for most of our fires? Why not bring before the bar of this court the guilty one who causes these defendants to work havoc throughout the land? Without his evil influences they would merely be servants of humanity.

Judge: The court is of the opinion that the point is well taken. Carelessness should be the defendant here and not these prisoners. Where is Carelessness, Mr. District Attorney? This court is of the opinion that you have been remiss in your duty in overlooking the arch criminal who causes the majority of all fires. (Court officer walks over and hands a note to the District Attorney.)

District Attorney: Your Honor, I have been looking for Carelessness and I have just received word that he has been brought to court and is now in the ante-room.

Judge: Have him brought in. (Carelessness, represented by a pupil in patched, dilapidated clothing, is hustled in roughly by the court officer who leads him before the Judge.)

Judge: The testimony that has been given in this court in the case of The People vs. Fire has indicated that you, Carelessness, are the culprit who should have been brought before the bar of justice. You are charged with having caused the loss of thousands of lives and the destruction of millions of dollars' worth of property every year. What have you to say in defense?

Carelessness: Nothing, your Honor, except that I am an ingrained habit of the American people. I begin with the youngest children and stay with them throughout their lives. Other countries do not encourage me to any great extent, but I seem to be welcome in every city, town and cillage of the United States, by young and old and rich and poor alike. I recognize danger, but I like to "take a chance."

Judge: That is an explanation, but not an excuse. I charge the Jury, on the evidence of all the other defendants and on his own admission, to find Carelessness guilty in the first degree.

(The Jury consult without leaving their seats; the Foreman rises.)

Foreman: We find him guilty, your Honor.

Judge: You have, heard the verdict. It is now my duty to sentence you in

(Continued on Page 383.)

Madam! Do You Waste?

CAN you *afford* to waste these days? Your husband is saving in the field. Are you helping in your kitchen?

For instance, your left-over bread. Don't throw it away. Here's a healthful, delicious way to use it—and save more expensive foods.

Try this dish for your farm-help—but be sure to use *the raisins,* for *there's* the charm.

What a Camp Cook Proved

A California camp cook's worry recently was left-over bread. But one day he put in some raisins. The men ate all and called for more. He had to serve it twice a week. He had to *bake bread* for raisin-bread pudding after that. Many ate two helpings, and he saved on more expensive foods.

And he made a more *contented crew.* The camp soon became famous for its food, due mainly to that dish. It could always get men easily. Help *wanted* to work there. And the camp profited greatly—due to *raisin* bread pudding!

Try and See

Try this dish on your farm hands. Look for like results. New food like this brings new vim and energy to your men.

Let them *taste* raisin-bread pudding made like this. The raisins add *nourishment* as well as luscious *flavor*—1560 calories of energizing nutriment per pound. So this dish is a *man's* food, good for red blood.

Raisins are 30% cheaper than formerly—see that you get plenty in your foods.

Sun-Maid Bread Pudding

To a pint of bread crumbs add a well-beaten egg, a cupful of milk, 1 tablespoonful of molasses and 1 cupful of SUNMAID Seeded Raisins cut in halves. Mix well together, then stir in ½ teaspoonful each of cinnamon, salt and soda. Turn into a buttered pudding boiler and cook 2 hours. Serve with the following sauce: Beat to a cream ½ cupful of butter and gradually beat into it a cupful of sugar. Add any preferred flavoring. When it is smooth and creamy pile it roughly on a pretty dish, place where it will get cold, and before serving grate over it a little nutmeg.

100 Recipes Sent FREE

There are a hundred different ways to serve delicious raisin foods. We've put them all into a valuable book that you should have to help you feed your men. This book will save time, trouble and expense. You need a copy so send for it now. The book is FREE. Just mail the coupon for it.

SUN-MAID RAISINS

Sun-Maids are the daintiest, the plumpest, tenderest raisins—made from finest California table grapes. Ask your dealer for them.

Seeded (seeds removed); Seedless (grown without seeds); Clusters (on the stem). Clean, sweet, wholesome American raisins, the kind you know are good.

See that you get the genuine Sun-Maid brand.

A King Segis Pontiac Offering

102 REGISTERED HOLSTEINS 102

SYCAMORE ACRES, Owned by Robt. N. Clapp, Nuevo, Cal.

SELLING AT

Rhoades & Rhoades Sales Pavilion, Hynes, Cal.

Friday, October 21, at 9:30 a.m.

This is without question the greatest offering of the blood of King Segis Pontiac ever made in the west, including high record cows and daughters of such cows, and a wonderful lot of individuals.

20 DAUGHTERS OF KING SEGIS PONTIAC

All young, many out of high record dams of most attractive breeding, and including a number of high class show quality.

31 DAUGHTERS OF PEARL KING SEGIS PONTIAC

Who is by King Segis Pontiac and out of a 37.51 lb. daughter of Pontiac Korndyke that milked 753.9 lbs. in 7 days, second dam a 727.03 lb. yearly record 4 year old daughter of Pearl of the Dairy's Joe De Kol.

13 DAUGHTERS OF KING PONTIAC NETHERLAND SEGIS 3D

The famous young sire formerly at the head of the Rosamaines Rancho herd. He is sired by a grandson of King Segis Pontiac and out of the twice 34 lb. cow Gerben Abbekerk Maid. His daughters in this sale are a wonderful group of young females, with records up to over 30 lbs. butter in 7 days for a 4 year old.

3 DAUGHTERS OF KING SEGIS PONTIAC CHICAGO

Who sold for the then world's record price of $20,000.00 when a calf. He is by King Segis Pontiac and out of the 40 lb. cow Johanna De Kol Van Beers.

7 DAUGHTERS OF PAUL CALAMO KORNDYKE

The great show bull that has many Grand Championships to his credit in the best shows. His daughters in this sale include the famous National Dairy Show winner Nancy Calamo Korndyke.

FOUR 30 TO 34 POUND COWS

Including the great twice 34 lb. cow Gerben Abbekerk Maid, now making a splendid strictly official yearly record in her tenth year.

If you are looking for young cattle with splendid type and rich King Segis breeding, you will find in this offering one of the choicest lots ever sold in California.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED BY DR. HURT, L. A. COUNTY VETERINARIAN, AND SOLD SUBJECT TO 60 DAY RETEST.

TERMS OF SALE: Responsible parties may arrange for credit with the sale managers on the basis of one-third cash, balance in three, six and nine months, with approved notes bearing eight per cent interest. Credit arrangements must be made before sale.

Catalog free on request.

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years	2,040.97 Pounds
Milk	2 Years	41,547.20 Pounds
Butter	1 Year	1,130.66 Pounds
Milk	1 Year	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days	30.47 Pounds
Milk	7 Days	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

LIVESTOCK SALE CALENDAR

Holsteins

October 12, John Saxer, Modesto.
October 21, Robt. N. Clapp, Nuevo.
November 3, A. W. Morris & Sons, Inc., Woodland.
November 9, Palo Alto Stock Farm, Palo Alto.

Herefords

October 19, W. J. Bemmerly, Woodland.
October 27, Pacific Coast Hereford Breeders' Association, California National Livestock Show, San Francisco.
November 1, J. H. Cazier and Sons, Sacramento.

Shorthorns

October 28, California Shorthorn Breeders' Association, California National Livestock Show, San Francisco.

Guernseys

October 20, Walter H. Dupee, Rhoades & Rhoades Sales Pavilion, Hynes.

Escalon Lady, a member of the Grapewild Guernsey herd owned by A. B. Humphrey, Escalon, has completed an advanced registry record of 539.07 pounds fat from 10,715 pounds milk. She started the test at the age of three years and eight months.

J. E. Wherrell, Riverside, has recently given his Jersey cow, Fern Oxford's Snowdrop, a Class AAA Register of Merit record of 321.29 pounds fat from 4,517 pounds milk. She started her test at the age of two years and ten months and continued for 305 days.

Announcement has been made that the Bridgford Holstein Co., Patterson, will consign a daughter of their 30 pound four year old, Fairmont Pauline De Kol, to the next Brentwood National Sale to be held at Philadelphia.

According to C. R. Thomas, manager of the California National Livestock Show which is to be held at San Francisco, October 22-29, a number of Eastern Hereford breeders have entered show herds. Among the out of state breeders are: A. B. Cook, Montana; Harry Thiessen, Idaho; James McNery, Oregon, and A. H. Barnum, Oregon.

J. W. Van Natta of Indiana, one of the best known Hereford breeders of this country, has been selected to rate Herefords at the approaching California National Livestock Show. Dean C. F. Curtiss of Ames, Iowa, will place the Shorthorn classes and Hugh G. Van Pelt of Iowa will judge the dairy classes.

The students of the college of agriculture and the university farm who are specializing in animal husbandry have organized the Golden Hoof Club. Meetings are held at the university farm each week at which various phases of animal husbandry are discussed.

William Clar of Petrolia, Humboldt County, has purchased from the Blayney herd, near Denver, two young Hereford bulls, Choice Wyoming and Wyoming 18th.

The fall sale season opens next week at Visalia when the S. O. Walker Holstein herd is dispersed. The next day, October 5, the Holstein herd of Robt. T. Curtis & Son will be sold at Tulare, and the day following the well known Eldorado herd owned by Alex. Whaley will be sold at the same place. The three sales will include nearly 175 head of registered cattle and breeders are looking forward to the vendues with considerable interest as an indication of the probable strength of the fall market. All the sales will be handled by the California Breeders' Sales and Pedigree Co., and Manager Hughes states that arrangements have been made by his firm to finance purchases in these and all other sales to be held this fall.

Hervey Bates Perrin, Santa Ynez, has just purchased a foundation herd of Herefords from Kentucky breeders. From J. L. Cleveland he bought 13 daughters of Woodford 10th, a daughter of Woodford 5th, (a full-brother to the champion Woodford 9th). In addition he selected three cows of strong Anxiety and Beau Donald breeding. They were dams of some of the heifers by Woodford 10th. The cows are in calf to the same bull. For a herd bull to go with the granddaughters of Woodford he selected from J. N. Camden's herd a junior yearling son of Woodford 6th out of a daughter of Beau Donald 75th. The foundation that Mr. Perrin purchased will give him a herd of close-up Woodfords. All the grade cattle have been sold from Mr. Perrin's 2500 acre ranch, and his entire time will be devoted to purebreds.

Twenty-seven young dairy bulls were sold at the Petaluma sale for an average of $183. Top price, $515, was paid for a Holstein bull consigned by A. W. Morris & Sons, Woodland. Guy H. Miller of Modesto sold the top Jersey bull for $225 and A. B. Humphrey of Escalon sold the top Guernsey bull for $359.

The Butte City Ranch, Butte City, has offered a Shropshire lamb as a prize to be competed for by students of the college of agriculture at the next annual university farm picnic.

The Chico board of education has made an appropriation of $12,000 for construction of buildings and other equipment to be used in practical swine demonstration work.

Shorthorn breeders of the state are planning their sixth sale, to be held on October 27 at the California National Livestock Show at San Francisco. At present, the entries comprise 36 females and ten bulls, carefully chosen from the herds of the Shorthorn Breeders' Association. Many of the entries in the sale will be entered also in the prize ring of the show. Among the consigners to the sale are: Blackhawk Ranch, Diablo; Warm Creek Land and Livestock Company, Wells, Nev. Henry M. Elberg, Woodland; William Bond, Newark; Howard Vaughn, Dixon; Pacheco Cattle Company, Hollister; E. Shepard, Jack London Ranch; C. Harold Hopkins, Woodland; Ormondale Ranch, Redwood City; Caledonia Farms, San Francisco; H. C. Muddox & Son, Sacramento.

Bock Brothers of Pacheco sold six purebred cows to the Moraga Holstein-Friesian Stock Farm owned by Miss Alberta H. Higgins and Miss Gertrude E. Mallette. One of the cows has a record of 619 pounds of milk and 23 pounds of butter in seven days as a two-year-old; 240 days after calving 426 pounds of milk and 18 pounds of butter in seven days. Two of the young cows are from a 26-pound dam.

H. M. Elberg, Roselawn Stock Farm, Woodland, has announced a public sale of Shorthorns to be held at the home farm, November 16. The Elberg herd is regarded as one of the top collections of the breed in this state and it is expected that the forthcoming sale will prove one of the outstanding attractions of the fall sale season. About 35 head of Scotch and Scotch topped sorts will be included and many of the females will feature the service of Eastlawn Champion, junior champion at the 1919 state fair. The sale will be held under the management of the California Breeders Sales and Pedigree Co.

Howard Vaughn, Mountain View Stock Farm, Dixon, has sold a roan yearling Shorthorn bull to the Briggs Ranch, Healdsburg. Mr. Vaughn reports an increasing demand for Shorthorn breeding stock and Chester White swine.

Imp. Boquian Guinea Stamp, the $12,000 Shorthorn bull owned by Ormondale Ranch, Redwood City, died late last month. This bull was purchased last year and was regarded as one of the top bulls in the Hartnett

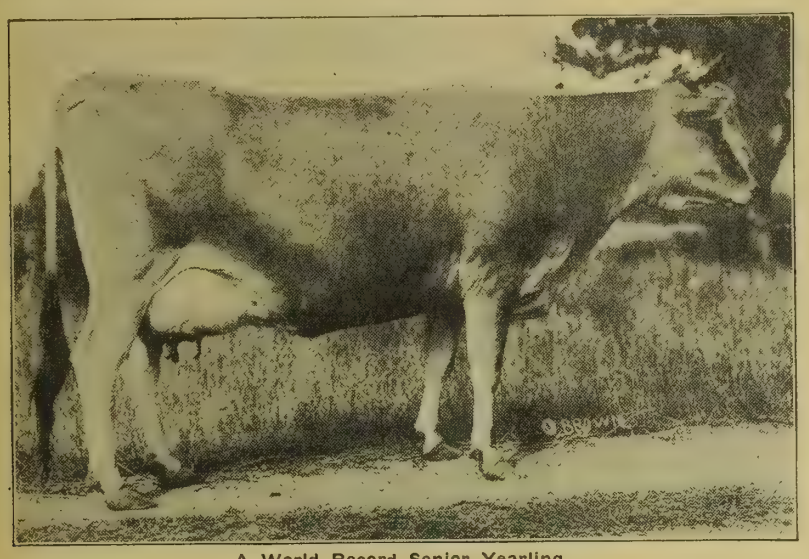
W. F. YOUNG, Inc., 244 Temple St., Springfield, Mass.

importation. The loss of this bull, following closely the death of the other Ormondale herd sire, Golden Goods Junior, sire of Little Sweetheart and many other good ones, is a severe setback to the efforts of the Ormondale people to build a high class herd.

Blackhawk Ranch, Diablo, has sold to Elon Dunlap of El Dorado County the two Shire mares, Quanea Diamond and Blackhawk Alberta. Quanea Diamond was foaled in 1909 and was sired by Moulton Gallant Prince. Blackhawk Alberta is a three year old sired by Anwick Arthur and out of Quanea Princess.

C. P. Hembree of Willows made a sale of registered Jerseys at Orland, September 30, in which 14 head of females averaged $206. Rochette's Golden Bell topped the sale, going to M. Fortini of Orland for $460. The same buyer secured the second highest priced animal for $350. All the cattle were taken by local buyers.



A World Record Senior Yearling

St. Mawes Lads Lady who started her test at one year and 11 months and produced during the following 12 months 11,756 pounds milk and 829.4 pounds fat. Her first month's production was 56 pounds fat. She was given principally green feed. She is the property of Harry D. Iliff, an Oregon breeder. Photo copyrighted and used by courtesy of Chas. Talmadge.

Manager Thomas of the California National Livestock Show is elated over the quality of draft horses entered for the forthcoming show. Blackhawk Ranch, Diablo; Palo Alto Percheron Farm, Palo Alto; Miller & Lux and Romie C. Jacks are among the leading exhibitors. Jacks makes his initial appearance as a Percheron exhibitor at this show and has entered 16 head.

PACIFIC INTERNATIONAL

One of the typiest and most beautiful bulls of any breed is Count Tickford, a milking Shorthorn two year old, owned by Thomas Harrison of Santa Rosa. Count Tickford has been in the show ring a number of times and has been a consistent winner. A year ago he appeared at the Pacific International Livestock Exposition at Portland as a yearling bull and won first in a strong class of seven animals. Mr. Harrison expects to show him again at the Pacific International at Portland, Oregon, this year, November 5-12.

Last year there were 3,000 animals at the show, with a great showing both in quantity and quality. This year, O. M. Plummer, the manager, expects 4,000 animals at least, with the quality, if anything, better than it was a year ago.

The milking Shorthorns were a strong class last year and entries indicate just as strong this year. California is always well represented at the Pacific International, and indications are that there will be at least 20 cars of stock. At this exposition will be gathered beef and dairy cattle of very strong classes, sheep, swine, goats, both Angora and milk, and a great showing of heavy horses. In addition this year the Western Dairy Products Show will occupy a good deal of attention.

The Western Winter Poultry Show is to be held at the exposition with probably 2,500 birds and rabbits numbering close to a thousand.

The Night Horse Show is a feature that has been most attractive in the past. Ten thousand dollars in premiums has drawn to this spirited show the finest light and fancy horses in the West.

The building is worth seeing—it is regarded by livestock men all over the world as a model. Ten acres under one roof makes it the largest livestock exposition building in the world. A great many California people have arranged to attend and there will be room for more.

WORLD'S RECORD BY JERSEY YEARLING

What is perhaps the most unusual performance in the history of milk and butter fat records, is the test just finished by St. Mawes Lad's Lady, the new champion yearling cow of all breeds. The making of 829 pounds of butter fat by a yearling heifer is remarkable enough without taking into account that she did it under circumstances that are about opposite from the usual experiment of handling a cow on test. Instead of starting at a fast clip and slowing down at the finish, this youngster took things comparatively easy at the start and finished with a sprint. In her first month she made 50 pounds of fat and in the tenth month she made 85 pounds. This is partly explained by the fact that she started on two milkings a day, then went to three times a day and for the last three months was milked four times daily. That she has a wonderful constitution is further shown by a gain of 250 pounds in weight during the year. She is expected to calve soon and has been with calf 210 days of the test.

St. Mawes Lad's Lady is owned and was tested by Harry D. Iliff of Independence, Oregon, who says he fed her ten pounds of grain daily at the start of her test and increased this to twenty pounds at the high point of her record. This is in addition to hay pasture and ensilage. St. Mawes Lad's Lady is the third Oregon cow to break the yearling record in the last two years.

Summary of her authenticated fat test for one year: August 22-31, 1920, 232 lbs. milk, 14.27 lbs. fat; September, 833, 51.23; October, 908, 56.75; November, 834, 55.38; December, 890, 61.14; January, 1921, 891, 70.57; February, 839, 64.10; March, 973,72.78; April, 995, 77.81; May, 1185, 84.61; June, 1256, 85.91; July, 1194, 82.27; August 1-21, 726, 52.27; totals, 11756, 829.09; average percentage fat, 7.05.

DAIRY UNION TO MEET

There will be a meeting of the members of the National Dairy Union at St. Paul, October 14, for the purpose of electing directors and transacting other business. A meeting of the board of directors will be held at the same time, as will the National Dairy Show at the Minnesota Fair Grounds.

The National Dairy Union is an organization of dairy interests, formed to protect the industry from the fraudulent sale of any substitute for the product of the dairy; to protect the interests of the consumer of dairy products; to disseminate dairy knowledge, and in every way further the interests of dairymen and others engaged in the handling of dairy products.—A. M. Loomis, Secretary, 303 7th street, Washington.

An Extraordinary Sale of Richly Bred Young Holsteins

A. W. MORRIS & SONS CORPORATION, Woodland, Calif., will sell 55 registered Holsteins at public auction at State Fair Grounds, Sacramento, Calif., Thursday, November 3, 1921.

From the standpoint of the good of their own breeding operations they make this offering with the greatest reluctance, for the frank purpose of the sale is to realize a substantial sum of money necessary in the readjustment of their business, and in order to present cattle that will command substantial public appraisal they have had to cut deep into the young breeding herd on their new farm.

When the new farm was acquired some two years ago, the young cattle that had been raised on pasteurized milk were tuberculin tested and only those were placed on this farm. There are now over 150 head on the place and the entire lot was lately tuberculin tested with only three animals responding to the test.

In this sale offering there is not a single animal over four years old, and every female except one is sired by either Sir Aaggie De Kol Acme, King Morco Alcartra, Prince Gelsche Walker, King Mead of Riverside, or Segis Pontiac De Kol Burke.

Nineteen of these choice young females are due to calve before December 10, 1921, to Sir Aaggie De Kol Mead, the great young son of Miss Valley Mead De Kol Walker. Most of the balance are due to calve this fall or early next year to King Aaggie Mead, Sir Prince Aaggie Mead, or Sir Aaggie De Kol Acme.

These cattle are sold tuberculin tested and subject to retest by the buyer.

Responsible parties may arrange with the sale managers before sale for credit on the basis of one-third cash, balance in three equal payments in three, six and nine months, with approved notes bearing eight per cent interest.

Prospective buyers are invited to write for catalog of sale now.

EDGEMOOR FARM

Owned by W. H. Dupee

SANTEE, CAL.

WILL OFFER

51 REGISTERED GUERNSEYS 51

AT PUBLIC AUCTION

Rhoades & Rhoades Sale Pavilion

Hynes, California

Thursday, October 20, at 10 A.M.

THE FEMALES:

There will be 41 females in the sale, all heifers, and practically all are bred. A large number are bred to MASTERPIECE OF EDGEMOOR, one of the greatest young sires of the Guernsey breed, also some to the undefeated show bull DEANIE'S MAROSE OF APPLETREE POINT.

The offering includes granddaughters of Governor of the Chene, Spottswood Daisy Pearl, Rose of Lanwater and a considerable group sired by a double grandson of Governor of the Chene.

These choice heifers should meet with the approval of the many prospective buyers who wish a foundation of young registered Guernsey females of substantial breeding and bred to bulls of unusual merit.

THE BULLS:

The ten bulls in the sale list include a number ready for service, of desirable type and approved breeding, and should find favor with both breeders and dairymen.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO 60 DAY RETEST.

TERMS OF SALE: Cash unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in 3, 6 and 9 months, to responsible parties, with approved note bearing eight per cent interest.

First Prize Calf Herd, 1921 California State Fair

60 REAL FOUNDATION HEREFORDS
AT PUBLIC AUCTION

FROM

Nevada Hereford Ranch, Wells, Nev.

Owned by J. H. Cazier & Sons Co.

SELLING AT

State Fair Grounds, Sacramento, Cal.

Tuesday, November 1, at 10 a.m.

In the quality of its cattle; the ability and constructive policies of its owners; the unexcelled history of good health; and all around excellence as a real breeding herd, this herd ranks among the foremost collections of Herefords in America.

Cattle from this herd have invariably done well for new owners in California, and the present offering will consist of approximately 55 females and 5 bulls, mostly carrying the Harris Standard 2nd—Beau Blanchard 76th cross that has been the outstanding feature of our Hereford shows the past two years.

This then is an opportunity to buy Herefords of real foundation quality in every sense of the word, at a time when the breeding of these cattle offers one of the most attractive futures in agriculture.

THIS IS A FEDERAL ACCREDITED HERD

LIBERAL TERMS OF SALE: Responsible parties may make arrangements before sale, with the sale managers, for credit on the basis of one-half cash, balance in six months with approved note bearing eight per cent interest.

MAKE YOUR PLANS NOW
TO VISIT THE

California Livestock and Horse Show

San Francisco, October 22nd to 30th

Four acres under canvas will house the greatest stock show ever held in this city and a show that will rate, judging by the entries to date, with the best livestock shows of the West.

Some of the finest American herds of Shorthorns, Herefords and Aberdeen-Angus have been entered, together with Holsteins, Jerseys, Guernseys, Ayrshires, several breeds of draft horses and sheep, poultry and pet stock.

The Horse Show will be held nightly. For this there have been entered some of the finest animals in the West, including drivers, saddle, hunters, jumpers, polo and other ponies.

Upon the success of this show depends the establishment of a permanent livestock show at San Francisco. Every livestock breeder should do his share to make the show a success.

REDUCED PASSENGER RATES ON ALL RAILROADS

Do Not Miss the Fair at Riverside

By Jack Klein

YEAR after year the Southern California Fair at Riverside has grown until this year it has almost burst its bounds and the officials are hurrying and scurrying to provide adequate accommodations for all exhibitors. Entries of livestock are pouring in from all parts of California; the goat department is demanding additional space to house the biggest show ever held; entries for 250 chickens have been turned down because the building which was increased by half during the summer is unable to care for them. This is going to be a truly great show and everyone should be there.

Up to date 130 Holsteins have been entered, including the herds from the Maxwell Farms, Hartstook, Santa Monica Dairy Company, Sierra Vista Ranch, Clapp, and George Junior Republic. Such animals as King Segis Pontiac Jannek, grand champion at San Fernando, and Dichter Spofford Korndyke Lad 5 who was grand champion of the show last year and of the 1921 state fair, and cows who have won at the National as well as in many shows in this state will compete.

The Guernsey show will be the biggest of the year with herds from Dupee, Humphrey, Windmere Ranch, Adohr Stock Farm and Russell Cox competing. They will show such animals as Masterpiece of Edgemoor and his half borther, Inspiration of Edgemoor, who was senior champion at San Fernando. Rex of Maple Hill owned by Adohr will show against his half-brother, Nobleman of Maple Hill, this year's grand champion at the state fair, shown by Humphrey. In the females there will be plenty of competition with animals of state wide fame.

Jim Thorp will have 20 Jerseys to go against the southern herds of Wherrel, Thomas, Brown and others. In the Ayrshires the Meyer Elkhorn herd is booked to appear against the MacMinn herd from Phoenix, Arizona. A few animals from local herds will be there also.

So far in point of numbers the Berkshires are in the lead with over 100 head entered. The Italian Vineyard Co. and Humphrey have been fighting it out all the way down the line, and these two herds will meet Fred Hall and Chester Johns who have not shown against them this year. Both of the last named breeders have excellent stock and the big herds will have to yield in places. Along with these will be a number of entries by pig club boys and small breeders.

The Durocs will again be headed by Mong and Craig and the Sierra Vista Ranch. As the district around Riverside is pretty strong in red hogs there will be considerable competition from the small breeders.

The Poland Chinas are not to be so numerous but there will be some surprises. Fred Gatewood will show Navy Boy, who was grand champion at the state fair, and Buckland and McNeil will bring a large herd from Fresno to combat the Eastman Ranch and others.

The Hampshires will be more numerous than at any other fair. Lonnie Buell will have his good herd to compete with the Fairbanks Ranch, Gordon and Langdon and Dr. Newton.

Litter contests, with a lot of real money for the winners, have stirred up much enthusiasm amongst the hog men. The horse and heavy cattle departments are a bit disappointing in the number of entries so far but for hogs and dairy you will not find a stronger show. The agricultural departments also are flooded with entries and practically all of the southern counties will contest for the big prizes offered in that department.

There will be plenty of good amusements and horse racing to help make this a real fair.

The Present Sheep and Wool Situation

By Robt. F. Miller, Associate Professor, Sheep Husbandry, University of California

THE sheep population, as given by the 1920 census, has not changed materially in numbers from that of 1910, namely, about 2½ million, showing that the industry is holding its own in California. However, the number of sheep in the United States as a whole has decreased considerably. We hear general complaint just now about low prices and some even would have you think that the sheep and wool business has gone to the "demnition bow-wows," but one only needs to get out and try to buy good young breeding ewes to find that the owners are not turning loose. They are optimistic and not inclined to sell unless offered a good price.

Formerly wool production was the main issue in sheep raising throughout the west, but with the advent of greater mutton prices the tide gradually turned from wool to mutton until the last few years western sheepmen have been using mutton rams on their range ewes very generally. Hampshire and Shropshire rams have been especially popular for this purpose and the cross-bred lamb has found ready sale on the market.

The public is getting a tender, juicy lamb chop rather than a dry, tough mutton chop, the latter probably out of a Merino wether or an old ewe. The "Eat More Lamb" campaign has been helpful in bringing to the attention of the hotel keeper, restaurant proprietor and the housewife this change of quality in mutton which induced them to include this article in their bill of fare.

As a result of these two factors, mutton consumption has increased very materially during the last three or four years, and today more than ever before "black faced" rams are running rampant among western range flocks. The writer knows of one case where practically pure-bred Rambouillet ewes are being crossed with Shropshire rams. This is true not only in California but throughout the range states north and east of us.

Due to this system of breeding which calls for the disposal of both ewe and wether lambs the country is in a deplorable condition as regards good breeding ewes. It has been estimated that the average age of western range ewes today is about five years which is nearing the limit of their usefulness. Those that are being replaced are of an inferior type due to the presence of considerable "black face" blood. If this continues the inevitable is certain to happen, that is, complete depletion of western breeding ewes, and it is high time for the older experienced sheepmen to look toward restocking the range. "A word to the wise should be sufficient."

The production of early spring lambs is becoming more popular each year, and this spring sheepmen have realized well on their lambs, which has been a savior, in view of the low price of wood.

Due to a rather sluggish lamb market on this coast, California sheepmen have shipped train load after train load of lambs east and most of them netted $5 to $6 per head which is $1 to $2 more than they were offered at home.

The growers of Yuba, Sutter, Butte and Colusa Counties organized last spring and by appealing to the railroads, special through trains run on schedule time, were put on which made it possible to land lambs in Chicago in only five feedings en route, while before it was necessary to feed eight and ten times. A better quality of alfalfa hay was provided at the unloading stations and both the Southern Pacific and Western Pacific have agreed to enlarge their feeding yards and give the sheepmen the best of service in another year. Another illustration where organization saved the grower thousands of dollars.

This is the work of only a few counties; why not make it statewide and

Keep your hogs free from lice

Keep their sleeping quarters, the feeding grounds, pure and healthful. Use the sprinkling can. Add four tablespoonfuls of Dr. Hess Dip and Disinfectant to each gallon of water. Sprinkle the animal body to kill the lice, the sleeping quarters and feeding grounds to destroy the disease germs. Or provide a wallow, to which add about one gallon D and D to every 70 gallons of water. Disinfect the barns, the poultry house.

Also use it about the home, in the sick room, sink and cesspools, to establish better health conditions.

DIAMOND G HEREFORDS

A few choice young bulls, big, heavy-boned husky fellows sired by DON PERFECT 2ND, one of the best sires in the West. Priced right and guaranteed.

H. H. Gable Esparto, Cal.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

have the California Wool Growers Association direct the shipping of lambs so as to realize the best there is in the business today. Without proper cooperation there is danger of flooding a certain market and the growers would lose heavily in a single shipment. On the other hand, it would be a simple matter to station a man at Laramie, as has been suggested, and direct the lamb shipment to the proper place. Correct marketing is the greatest factor in making a business profitable today, and I say, sheepmen, get together and you can make your business the most profitable livestock business there is.

HAMPSHIRE BREEDERS

The California Hampshire Swine Association held its annual meeting at the Porter Hotel, San Fernando, September 24. Some reports were received and some business transacted, but it was found that all the business could not be finished so the meeting adjourned to meet in Riverside at the Southern California Fair. Officers elected were: vice-president, Gwyn Thurmond; secretary-treasurer, E. A. Newton. Members present were Messrs. Helm, Thurmond, Buell, Winn, F. A. Langdon, H. L. Langdon, Harvery, Dinsmoore, Gilbert, Newton.

HOLSTEIN-FRIESIAN ANNUAL

The regular annual meeting of the Southern California Holstein-Friesian Association will be held at the Reynolds Hotel in Riverside at 7:30 P. M., on the evening of Wednesday, October 12. This will be on the same day that Holsteins are judged at the fair. Present officers of the association are: president, Geo. M. Brown; secretary, R. A. Condee.

DON'T ENTER SILO TILL BLOWER IS TURNED ON

Turn the machine blower on and leave it on for at least two minutes before anyone is permitted to enter a partly filled silo. Unless this rule is followed the result is likely to be dead men.

Annually fatalities occur as a result of workmen entering half filled silos after the deadly carbon monoxide gases have had a chance to accumulate directly above the freshly ensiled corn. A few days ago two Illinois farmers were killed and another was rendered seriously sick by silo gases which are almost as dangerous as the poisonous mustard gases used during the recent war. In this instance one of the farm workmen entered a 50 foot silo which had been half filled the previous day. Some time elapsed and when he did not come out another of the hands ascended into the silo. Neither reappeared, though the other workers shouted to them repeatedly to come down.

Fearing an accident, the farm owner finally climbed into the silo. He also was immediately overcome by the poisonous fumes and only the fact that others followed him, forced open the extra silo doors and carried him into the open air saved his life. The other two men were suffocated immediately.

Each year a number of accidents of this kind occur, due largely to carelessness and ignorance of the proper methods of eradicating the dangerous gases. The preventive measures are simple and efficient and where they are followed there is no danger.

No workman should ever enter a partly filled silo after the ensiled corn has had an opportunity to develop poisonous carbon monoxide gases overnight until the machine blower has been started. The fresh air dilutes and scatters the obnoxious gases to the extent that they are rendered harmless. After the blower has been operated for two minutes it is perfectly safe for the workmen to enter. Another precaution which should be practiced religiously is not to wedge the silo doors into place until they are needed to prevent the waste of the ensiled corn. Many farmers follow the practice of placing most of the doors before any great amount of corn is cut and deposited in the silo. This prevents free circulation of air through the silo which in turn operates to favor the accumulation of carbon monoxide and other deadly silo gases.

DISPERSAL SALE

One of Stanislaus County's Choicest Herds

37 Registered Holsteins 37

Owned by JOHN SAXER, MODESTO, CAL.

Wednesday, October 12, at 11 a.m.

The sale will also include 6 head from the good herd of W. A. Walker, Ripon, Calif.

This is an offering of splendid type, substantial breeding, and presented in excellent physical condition. The offering includes

A 31 POUND GRANDDAUGHTER OF KING OF THE PONTIACS, out of a daughter of Sir Skylark Ormsby Hengerveld.

THREE DAUGHTERS OF SIR SKYLARK ORMSBY HENGERVELD, one of the very best sires ever developed in California.

A 2 YEAR OLD DAUGHTER of the great heifer Moorland Colantha Rose, sired by a 32 lb. son of King Mead of Riverside.

TWIN DAUGHTERS OF SEGIS PONTIAC DE KOL DUTCH, the Freeman & Edwards bull whose three nearest dams are all 1000 lb. yearly record cows.

THREE DAUGHTERS OF SIR WITKOP DE KOL, a three-quarter brother to the noted Freeman & Edwards heifer, Belle Faskie De Kol Witkop.

A SPLENDID LOT OF YOUNG COWS, many with good records, and representing most attractive and popular blood lines.

A SON OF MOORLAND COLANTHA ROSE

The sale will also contain a ten months old son of the great heifer, Moorland Colantha Rose, sired by Segis Dutch Ormsby, a 32 lb. son of Segis Pontiac De Kol Dutch. He is a high class individual, and should go to head a good herd of registered females.

Other young bulls of choice breeding, including two sons of the 31 lb. cow, Segis Johanna De Kol of Edelweiss.

Every animal positively guaranteed to be a breeder; every animal over six months old Tuberculin tested and sold subject to retest by the buyer unless otherwise announced at sale.

TERMS OF SALE: Cash, unless arrangements for credit are made before sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in 3, 6, and 9 months, to responsible parties with approved note bearing eight per cent interest.

The Cultivator Costs Only $1.00 Per Year

TO REDUCE FARM FIRE LOSSES

FARM fires cost about $20,000,000 a year—$18,166,710 in 1918. Of the fires that year 33 per cent were from causes classed as preventable, 3 per cent from partly preventable causes, and 30 per cent unknown but believed to have been largely preventable. With inadequate fire fighting equipment on farms fires are hard to control. Prevention is the best way to deal with them.

Defective chimneys and flues took toll to the extent of $1,962,031; sparks on roofs, $1,181,171; careless use of matches by smokers and others, $1,071,987; petroleum and its products, $732,067, stoves, furnaces, boilers, and their pipes, $674,968.

The largest item listed as partly preventable is lightning, $3,933,950.

Fire prevention day should be made a special time for looking over the premises to see that the buildings are in the best practicable shape to prevent and resist fire; that inflammable rubbish is cleared away; and that habits of safety are instilled in the handling of matches, lamps, stoves, and kerosene and gasoline.

Gasoline has come to play such an important part in farm life that special care should be taken to see that it is not stored in inflammable buildings and is never opened in the presence of uncovered flame.

Fire Prevention week ends on the semi-centennial of the great Chicago fire. While occurring in a great city the traditional cause of this fire was one which is liable to occur in the country, the upsetting of a lantern in a stable. If lanterns must be used in barns, they should be kept in good condition, set or hung in a safe place, and never filled or lighted in the barn.

Numerous disastrous fires are caused by thrashing machines, both by scattered sparks and embers and by dust explosions in the separators. All smokestacks should have spark arresters, and the ground around the boiler should be kept clear and wet down if necessary. Grain dust explosions are largely preventable. The United States department of agriculture has made exhaustive studies of the subject and is prepared to recommend adequate safeguards.

Serious losses are caused by sparks from locomotives, which ignite dry wooden shingle roofs and start many fires in straw, stubble, and grass during dry seasons. If a railroad runs through the farm, it will pay to plow a few furrows along the right of way as a fire break.

Kerosene lamps should be examined to see that the burners are in good condition, and should never be left where they may be upset. Kerosene and gasoline receptacles should be kept apart and should be so different as to avoid possibility of a mistake.

Ordinary friction matches should be kept in safe receptacles, away from children, and never carried loose. Smoking in barns and garages never should be permitted. Fire marshals of western states report greater fire losses in grain and straw the past season from carelessly thrown matches, engine sparks and automobile and tractor backfire, than ever before.

Buildings may be made safer by seeing that the chimneys are without cracks and free of soot, which may take fire and scatter sparks on dry roofs. Flues which may become hot should be covered with asbestos and any near-by walls and ceilings protected. There should be a sheet of metal under every stove.

THE TRIAL OF FIRE

(Continued from Page 377.)

accordance with the dictates of justice. There can be no doubt as to your guilt. You have made it impossible for citizens and municipalities to live safely. You have killed thousands and devastated whole cities by your iniquity. You have filled the land with misery. You have undermined character, lowered efficiency and retarded progress. Incarceration is too good for such as you. Instead you shall be labeled so that all men shall know you and shall shun your presence. You shall be an exile—a man without a country—unless some Nation is so short-sighted as to take you in and call you her own. America banishes you forever. Officer, take him away. (Officer exits with prisoner.)

Judge: The court is adjourned.

National Board of Fire Underwriters

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

of California Cultivator, published weekly at Los Angeles, Cal., for October 1, 1921.

STATE OF CALIFORNIA,
County of Los Angeles, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Frank J. Ironmonger, who, having been duly sworn according to law, deposes and says that he is the publisher and business manager of the California Cultivator and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse side of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business manager are:

NAME OF—	POSTOFFICE ADDRESS
Publisher, Cultivator Publishing Co.,	Los Angeles, Cal.
Editor, C. B. Messenger,	Los Angeles, Cal.
Managing Editor,	None
Business Mgr., Frank J. Ironmonger,	Los Angeles, Cal.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding one per cent or more of the total amount of stock)

Cultivator Publishing Co.,	Los Angeles, Cal.
R. M. Teague,	San Dimas, Cal.
Frank J. Ironmonger, Hollywood,	Los Angeles, Cal.
J. H. Yetter,	Los Angeles, Cal.
W. R. Wood	San Dimas, Cal.
E. H. Sanford	Claremont, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding one per cent or more of the total amount of bonds, mortgages, or other securities, are: (If there are none, so state). None.

4. That the paragraphs next above, giving names of owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholders or security holders appear upon the books of the company as trustees or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest, direct or indirect, in the said stock, bonds, or other securities as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is ——. (This information is required from daily publications only).

FRANK J. IRONMONGER, Business Manager

Sworn to and subscribed before me this 28th day of September, 1921.

(SEAL) ROBERT WHITFIELD,
Notary Public in and for Los Angeles County, Cal.
(My commission expires April 4, 1923)

Vigilance

THE VALUE TO THE PUBLIC of the Bell System service is based on the reliability, promptness and accuracy of that service.

As quality of service depends upon the economic operation of all telephone activities, vigilance begins where work begins. Science and engineering skill enter into the selection of all raw materials; and into the adapting and combining of these materials to the end that the finished product may be most efficient in operation and endurance, and produced at the least cost.

A series of progressive tests are made at every step during the transformation of these materials into telephone plant and equipment. And when all these complicated devices, with their tens of thousands of delicately constructed parts, are set in operation they are still subjected to continuous, exhaustive tests.

As the best of materials and the most complete machinery is of little value without correct operation, the same ceaseless vigilance is given to the character of service rendered in providing telephone communication for the public.

Such constant vigilance in regard to every detail of telephone activity was instrumental in upholding standards during the trials of reconstruction. And this same vigilance has had much to do with returning the telephone to the high standard of service it is now offering the public.

Hen Hatched Chicks for Vigor

By Jean A. Koethen

NOT every poultryman in these days of intensive methods has the courage to hatch and rear 800 chicks in a year with hens, but this is what the Hudsons, father and son, of the Hudson Poultry Ranch at Escondido, did this last spring. The task would have been harder, perhaps, if any other breed but Rhode Island Reds had been used for mothers. "We find them the quietest mothers," says Mr. Hudson, junior, "especially the pullets, and believe they can hatch more chicks from a given number of eggs and raise a larger per cent of every hatch than any other kind of hen, and there is no doubt at all in our minds that the vigor of these hen hatched chicks is greater than that of incubator chicks. We hatch all our breeders, male and female, with these hens." Certainly the bright combed, typey birds which fill the Hudson yards bear eloquent testimony to the efficiency of natural methods.

When Mr. Charles Hudson left his work as cabinet maker and his son, O. C. Hudson, turned his back on desk and tyepwriter, it was with the purpose of finding independence and a healthful outdoor life in the breeding of standard poultry. Now, after seven years, their five acres of fruit and their flock of 1,300 bred-to-lay hens give them a living from which no city job can tempt them.

They went to the Oregon agricultural college at Corvallis for their male White Leghorn breeders. With this western blood was mixed some Tom Barron blood from Pennsylvania. For four years every hen was trapnested, but lack of labor for three years past has made it impossible to continue all-the-year trapnesting, and now the pullets are trapnested only through November, December and January. Those that do not make a satisfactory showing in these three months are culled out and sent to market at once. The hen that does not begin her career promptly is hardly likely to prove a profitable producer.

Three Essentials

The work on this ranch is built on three foundation stones:

1. Sanitation. Water fountains are washed daily with boiling water. Clean straw for scratching and nest litter is put in twice a month. Dropping boards are cleaned and sanded daily. There can be no half way cleanliness, the Hudsons believe. Everything must be absolutely clean.

2. Abundant green feed. Laying hens are given green feed twice a day and pullets have it four times a day. In each house is a hanging trough of inch mesh wire for cut alfalfa which enables the hens to reach it easily without wasting a bit.

3. The ax. Sick hens are not doctored, they are killed outright. Mr. Hudson, senior, is quite emphatic in his condemnation of doctoring as a means of lowering the vitality of the flock. The sooner a sick hen is put out of the way the better for everybody.

The houses are built on the long house plan recommended by the poultry division of the state college of agriculture. Each laying house is 150 feet long and 16 feet wide, and divided into five sections each 30x16. This allows 480 square feet for each 200 hens, or nearly two and one-half square feet per hen. Portable fences are used so that the yard in front of a house may be planted to barley while the hens are run in the yard at the rear. Each planting of barley is cut twice before the hens are turned on it. By this system of double yarding a maximum amount of green range is attained at a minimum expense, and the yards are purified every six months.

Culling

The flock is culled every day in the year, but the culling is heaviest in July when all hens that have commenced to molt before the middle of the month are removed. All hens that go broody at any time in the year are banded and are never allowed in the breeding pens. By this strict exclusion of broodies they have nearly been eliminated. There are hardly a dozen "cluckers" in a year, and every one is marked.

Feeding

A commercial mash is always before the layers, and the grain mixture is at present milo and barley, half and half. The growing stock are given buttermilk at noon till they are three months old, and the milk pens stand before them till 5 p. m. During the fall months, when laying is heaviest, the hens get a buttermilk mash at noon. All greens are ground in a well equipped grinding shed and fed in the wire swings already mentioned.

The Hudson hens have made enviable records at several egg-laying contests. In the 1916 Oregon agricultural college contest the pen entered averaged 202 eggs per hen, and only one hen laid less than 200 eggs. In the All-Northwest contest at Pullman, Washington, two years ago the best hen entered laid 265 eggs and the pen averaged 186 eggs. The Hudsons were the first breeders in California to send hens to an egg laying contest. This year they have a pen at Mountain Grove, Missouri.

All market eggs from this ranch are shipped by truck to Los Angeles, where they net from five to seven cents more a dozen than can be secured in San Diego.

Poultry Queries

(Conducted by Jean A. Koethen.)

Partners

I own 41 acres of land and have a friend who wishes to go into the chicken business with me. I have a new chicken house 20 feet 2 inches by 50 feet 8 inches, and two pens 34 by 34. We expect to raise most of our feed. I want this friend to furnish 1,500 laying hens, which he is willing to do, but beyond this I do not know what other questions might arise. We are anxious to divide on a 50-50 basis. —Subscriber, Visalia.

A partnership in the chicken business is a very delicate matter because of the division of labor. If you furnished the land and houses and your friend the hens and labor, it would not be difficult to arrive at some basis of division of the proceeds. If you both work there is much chance for misunderstanding and dissatisfaction. Now as to the housing: Fifteen hundred hens will require approximately 4,000 square feet of floor space. You have a little over 1,000 square feet, scarcely enough for 500 hens. What the houses for the other 1,000 hens will cost nobody can tell you now. It depends on how you build them. After they are built or contracted for you can figure in value of housing and land (rental value in your locality, I should say), and let him furnish hens to the same amount. There will be some equipment, of course, which might or might not be included under housing and feed to keep your hens going till they become self supporting. If you make his hens offset your houses you could together put up the money for feed, each an equal amount. I do not see just how you can arrange if you raise your feed. In fact, I doubt if you will raise much beside greens. For what you do raise you will have to put in land against his seed and labor and divide according to the general practice of farming on shares. A little contract covering each point, after you have talked it out to your mutual satisfacion, would be a safe thing to have.

Sulphur for Chicken-pox

Do you advise giving poultry sulphur in the fall to ward off chicken-pox? Is it a preventive? If so, should it be fed daily, and what quantity to a pen of 500 birds? Would it be harmful in damp weather?—Subscriber, Van Nuys.

Dr. N. W. Sanborn, extension poultryman now in Florida, has prescribed sulphur as both cure and preventive for chicken-pox for a number of

Plant Winter Rhubarb FOR PROFIT

Growers netted this year $1000 per acre. This is the best time to plant for full crop next winter and spring. We can supply plants—all sorts for large fields. Write for price list.

J. B. WAGNER

Rhubarb and Berry Specialist, Pasadena, California.

years. As a preventive he mixes 3 per cent of sulphur in the dry mash. To cure the disease he makes the sulphur 5 per cent of the mash. This is kept before the birds a week or ten days, then the plain mash is fed for a few days, then the medicated mash repeated for another week. He claims that cases of chicken-pox will be less severe and the birds will come into laying condition more quickly with this treatment than without it. If the treatment works in Florida it must be successful in damp weather.

Brooder Houses

Will you please send me information on type of brooder houses for large flocks of chicks?—Subscriber, Chowchilla.

An illustrated article on brooder houses will appear soon. Most poultrymen who raise their chicks by thousands brood in large units, 500, 1,000 or even 2,000 in a unit, hovering them with one of the many types of brooder stoves or under an electric hover. They claim that while mortality is greater the labor involved is so much less that it offsets the losses. There are still a good many, however, who stick to the 100-chick unit and the small hot water or hot air brooder for each unit.

White Minorcas

Is there such a breed as the White Minorca? If so, how does it differ from the White Leghorn?—Subscriber, Point Arena.

The White Minorca is heavier than the Leghorn and characterized by slaty colored shanks instead of yellow. The difference in weight is not always apparent, for some strains of Leghorns are heavier than others, but the slate-colored shank is an absolutely reliable distinguishing mark.

NATIONAL EGG LAYING CONTEST

Mountain Grove, Missouri: Number of eggs laid by the different breeds during August and to date are: Leghorns, August 773, to date 9389; Wyandottes, August 712, to date 8657; Anconas, August 725, to date 8423; Plymouth Rocks, August 802, to date 8408; miscellaneous varieties, August 790, to date 8357; Rhode Island Reds, August 697, to date 8208.

Barred Rhinelanders, Michigan, 1027; S. C. White Leghorns, New York, 1016; R. C. Rhode Island Whites, Illinois, 999; Anconas, Missouri, 988; S. C. Reds, Colorado, 965; S. C. Reds, Missouri, 961.

SHIPPING BY AIRPLANE

One feature at the state fair this year which attracted the attention of poultry people was a bunch of 600 White Leghorn chicks shipped when a day old from Stubbe Poultry Ranch, Palo Alto, by airplane to the state fair. The chicks were delivered on the state fair grounds at Sacramento one hour and forty minutes after leaving Palo Alto. The chicks were photographed for the movies, were toasted and oh-ed and ah-ed until they felt they were wonderful chicks, and indeed they were.

FROZEN POTATO TOPS

Anton Follstad of the Wisconsin agricultural station weighed potatoes of four hills without detaching them from the vines, to determine if the tubers grew after the tops were killed by frost. The first occurred September 10. At four later dates the tubers were weighed and it is almost amazing to record that the tubers gained in weight more than one-fourth, or 26.40 per cent, or a yield per acre of 57 bushels.

Speed Up Layers Before Winter Comes
Your flock is doubtless laying *some* eggs—but you are losing money if they're not laying *all* they should, these days when egg-prices are going up.
Molting hens and growing pullets alike need perfect health in order to get to laying steadily and heavily *soon*. Shorten the molt—hurry the pullets—give your flock—today and every day—
Pratts Poultry Regulator
This is the simple and effective means used by thousands of successful poultry keepers to make hens lay and pay. Popular for fifty years. A natural tonic and health-maker—a digestive that makes feed go farther and prevents feed waste—a scientific all-round conditioner that may be depended on to wake up dormant egg-organs and *bring the eggs*. And that means dollars to you now and all winter. Pratts Poultry Regulator must please you—remember our guarantee.
Save Money Buy Pratts in 12- or 25-lb. pails; 50- or 100-lb. bags.

GRAIN AND FEEDS

Grain Exch. price bid Oct. 4.
Barley: 100 ton lots, Dec. del. 1.25.
Milo: 100 ton lots, Oct. del., 1.66.

HAY

Alfalfa Growers of California report:

Improvement in demand pronounced in San Joaquin Valley. Money for first crops is coming in and increasing buying power of these districts. In the southern part of the state most of the damaged and low grade hay has been disposed of as fertilizer, in other districts with prohibitive cost of baling and freight efforts are being made to bring in feeders.

There were 720 tons of grain and altracks the week ending October 1, with 170 tons held over.

Prevailing prices, delivered in vicinity of Los Angeles:

Choice Rabbit Alfalfa	$28.00
Choice Dairy	25.00
No. 1 Dairy	22.00
Standard	17.00
Straw	6.00

THE HOLSTEIN HERD WITH A FUTURE

Ten of Our 1921 State Fair Winners

Our Senior Herd Sire **DICHTER SPOFFORD KORNDYKE LAD 5th H. B. No. 201546** again proved his right to the title of GRAND CHAMPION Holstein Bull of California by carrying off the Senior and Grand Champion honors at the 1921 California State Fair. This Great Bull also showed his remarkable PREPOTENCY by siring a large proportion of the 1921 State Fair winners.

These included:

JUNIOR CHAMPION HEIFER
FIRST PRIZE JUNIOR YEARLING HEIFER
FIRST PRIZE SENIOR CALF HEIFER
FIRST PRIZE TWO YEAR OLD HEIFER
THIRD PRIZE TWO YEAR OLD HEIFER
FIFTH JUNIOR HEIFER CALF
FIRST JUNIOR YEARLING BULL
FIRST SENIOR BULL CALF
FIRST GET OF SIRE
AND HE SIRED THE FIRST PRODUCE OF DAM.

THE FIRST TWO HEIFERS SIRED BY DICHTER SPOFFORD KORNDYKE LAD 5th to freshen show an average test of 4 per cent and are going a 20,000 lb. milk clip.

We are offering for sale some wonderful yearling bulls (including State Fair winners) sired by this great transmitting sire AND OUT OF HIGH YEARLY PRODUCING COWS.

Now is the Time to Introduce This Blood. It Will Cost You More When Dichter's Daughters Have Completed Their Yearly Records

Become independent, earn $2,000 a year. Cavies are easy to raise, little trouble and little expense.

Big Profits If You Raise Guinea Pigs

In order to supply our ever increasing demand for cavies (guinea pigs), we desire to encourage more people to enter the business of cavy breeding.

This is a highly remunerative business. Considering the small amount of money necessary to start and the little spare time and space required to care for them, cavies yield a greater profit on the investment than poultry, live-stock or any pet stock. It is a business that requires very little skill, time or outlay of money. Only a little back yard space is necessary for several hutches. And we give you a binding contract to pay you at least $1.20 a pair (male and female) for all you raise two months old or older, bred from our stock and shipped to our Hollywood Laboratories.

Over 150,000 Needed Annually

Laboratories and institutions situated all over the country are continually buying. We have been 15 years building up this business and in establishing a reputation that brings this heavy demand for cavies to us. We want others to buy our dependable breeding stock and raise cavies. Many hundreds of people in all parts of the United States are making independent incomes from cavies originally purchased from us. You can start with a few cavies and soon have a fine lot, yielding you a good income. We have the whole plan worked out and will help you. Do you want to know more about the business?

You Can Easily Make as Much as $2,000 a Year Raising Cavies For Us

Due to their prolific breeding cavies increase very rapidly. Many cavy breeders who started in business with our stock are making $2000 a year, most of them working just during spare time. At considerable expense we have published a neatly printed and illustrated 44 page booklet telling in detail how you can make $2000 a year raising cavies for us. We will send a copy of this booklet to anyone answering this advertisement upon receipt of only 25 cents to help defray the cost of printing and mailing. Turn your spare time into cash. We give every purchaser a contract to buy back the cavies produced from our stock at $1.20 a pair or more as previously stated, from stock bought from us. Owing to the demand from many institutions for these animals we are often able to pay a higher price. Our customers are demanding larger deliveries. Write today for the booklet sending 25 cents in silver, stamps, money order or any convenient way.

DR. J. A. ROBERTS
Judge, Writer, Lecturer and Breeder of Cavies. Secty. Western Cavy Breeders' Association.

Dr. J. A. Roberts, proprietor of the Roberts Laboratories at 6634 Sunset Boulevard, Hollywood, California, is a pioneer in the United States in the breeding of cavies and one of the best informed men in the world in their selection, care and breeding. He has won highest honors in many of the largest shows in the United States and his Laboratories are known far and wide by institutions looking to him to keep them supplied with cavies for scientific purposes.

A Shipment From One of Our Raisers.

Cavy breeding should be considered equal to any business. We do not have children raising cavies for us, therefore no one under age should send in an order.

EDITORIALETTES

A busy Sacramento Valley scene is given on this week's cover. Hops were affected with sinking of the heart about the time prohibition went into effect but, like the vineyards, they seem to have come back. In any case hop culture in the Sacramento Valley is in the ascendancy today. An excellent idea of the importance of the industry is to be had from Mr. Horst's article on the fifth page of this issue.

* * *

A writer in the Cultivator recently stated that 200 pounds of sulphur per acre would practically eliminate nematodes or wireworms. In addition nitrate of soda people have always insisted that light application of nitrate would control these pests. It's worth the trying, and we are hoping Cultivator readers will make small experiment stations of their farms when it can be done at such slight expense.

* * *

A. C. Fleury, who has been for four years in charge of Los Angeles harbor quarantine station work, has been promoted to the post of deputy quarantine officer and transferred to the central office at Sacramento, where he will work with Chief Quarantine Officer L. A. Strong. He will be succeeded in the Los Angeles harbor work by A. P. Messenger who has been inspector in San Francisco harbor. Mr. Fleury took the work in Los Angeles harbor almost in its infancy and has established most thoroughgoing inspection service.

FESTIVAL OF DATES

The International Festival of Dates is to be held at Indio, Coachella Valley, Riverside County, on October 21, 22 and 23. "A display such as never made in any other section of the world" is to be made.

The Coachella Valley is making good as a date producer and this fact is to be burned in by this festival and the crowds of "show me" folks who will be attracted by it.

SOUTHERN CALIFORNIA FAIR

Riverside is all dressed up this week and entertaining all Southern California. She has a wonderful exhibit of California resources and affords abundant proof of the increasing popularity of the livestock industry. There is one great showing in all the dairy and swine classes. Beef classes are not so largely represented, but there is a showing of fine quality. In county and community exhibits, which are in the great agricultural tent, there is a showing of diversity seldom equaled. Dates, bananas, avocados, citrus fruits and other sub-tropicals are vying with pumpkins, corn, apples and other colder country productions, and while it may seem trite to state that there is superiority in every one of these classes, it is true, and California pride is increased by this exhibition.

ETHAN A. CHASE

Ethan Allen Chase died at his home in Riverside in his ninetieth year and after 30 years active connection with the fruit industry of California. Mr. Chase was born in 1832 in Maine, in early life moved to Rochester, New York, where he was engeged in the nursery business, and on his coming to California in early '91 he established large citrus orchards and nurseries in the active management of which he continued almost until the time of his death. Mr. Chase's entire life has been an inspiration and California horticulture owes much to his investigations and to practices conducted in his orchard properties in Riverside and Corona. His two sons, Frank F. and Harry B., have been partners in the business and will continue the work which Mr. Chase started.

COOPERATIVE CANNING

The Canners League of California is naturally bitterly fighting the cooperative canners' effort to market their product. The league is issuing a statement in which it is charged that "Already Armour is alleged to, and we believe does, control not only the canning plants but also, through crop advances made by the California Cooperative Canneries, controls many orchards."

This is emphatically denied by the cooperators, who are conducting a business which is saving them from the exactions of privately owned canneries which menaced their future production.

Dispatch from San Jose assures us that certain Middle West canners and large livestock associations are endorsing the present movement for modification of the attorney general's decree, also that opposition to modification comes from organized wholesale grocers and few coast canners who fear power of organized producers backed by efficient distribution.

A GREAT WEEK

Thursday, the 20th, begins a great week in the city of Los Angeles—a great week for horticulture of the Pacific Coast. The nurserymen, avocado growers, fruit growers and farmers, horticultural commissioners, farm advisers and, in fact, everybody interested in agriculture and horticulture will gather and discuss the larger questions affecting California's welfare. Transportation will perhaps come in for the greater share of the convention's time. There may be some fireworks, but in any case there will be much of information and inspiration in the present movement of citrus growers to establish a line of ships all their own between Los Angeles harbor and Atlantic Coast points. Another day will be given to legislation. Standardization and its enforcement in regard to California fruits and vegetables will be given a boost, and there will be many other practical matters discussed.

Editorials as to the opportunities for advancement of California horticulture appear on third page of this issue, written by a number of California's nurserymen. The real feast of the fete will be on Saturday night when the avocado people propose to feed up everybody on real avocados and plenty of them.

Program Fruit Growers Convention

THE program for the Fifty-fourth State Fruit Growers' and Farmers' Convention at Los Angeles, October 24 to 28 is announced by Director G. H. Hecke of the state department of agriculture.

From reports received the coming convention, which will be held at Exposition park, promises to be a great success. Extensive preparations are being made by the Los Angeles Chamber of Commerce for the entertainment of the visitors, as a large attendance is expected considering the fact that several horticultural conventions will be held during the same week. Among them are the Convention of the State Association of County Horticultural Commissioners, the eleventh annual convention of the California Association of Nurserymen, which includes the California Flower Show, and the annual convention of the Avocado Association. The Flower Show will be the greatest ever staged in California and is worthy of a large attendance.

Monday, October 24, Legislative Day

9:30 a. m., George H. Hecke presiding—Address of welcome, Mayor Cryer. Report Director of Agriculture George H. Hecke. Agricultural Legislative Committee, C. C. Teague, president, California Fruit Growers' Exchange. Report Agricultural Legislative Progress, R. N. Wilson, secretary, Agricultural Legislative Committee. Discussion, George Pierce, president, California Almond Growers' Exchange; George H. Cutter, president, California Fruit Exchange.

1:30 p. m., George H. Hecke presiding—Legislation Affecting Agricultural Cooperative Movement, George E. Farrand, Harris Weinstock. Discussion, Senator M. B. Harris, Judge Willis I. Morrison, F. H. Wilson, president, California Peach Growers' Association.

8:00 p. m.—Executive meetings; County Horticultural Commissioners' meeting; Agricultural Legislative Committee executive meeting.

Tuesday, October 25, Transportation Day

9:30 a. m., Wylie M. Giffin presiding—Report of Transportation Committee, Charles E. Virden, president, Virden Packing Company. Water Transportation, F. W. Whitcomb, chairman Water Transportation Committee, California Fruit Growers' Exchange. Discussion, Meyer Lissner, U. S. Shipping Board; Walter S. McPherson; Charles H. Bentley, sales manager, California Packing Corporation; Preston W. McKinney, secretary, Canners' League of California.

1:30 p. m., G. B. Daniels presiding—Transportation Problems of Vegetable Growers, Thomas O'Neill, president, California Vegetable Union. Discussion, L. K. Small, president, L. K. Small Company. Failure in Distribution of Agricultural Crops in 1921, G. Harold Powell, manager, California Fruit Growers' Exchange. Discussion, Carlyle Thorpe, manager, California Walnut Growers' Exchange; W. G. Alexander, director, California Prune and Apricot Growers; G. W. Felts, general manager Alfalfa Growers of California; Frank T. Swett, general manager, California Pear Growers' Association.

8:30 p. m.—Banquet, Sylvester Weaver presiding. Guests of honor, Gov. William D. Stephens; Henry C. Wallace, secretary of agriculture.

Wednesday, October 26, County Horticultural Commissioners' and Farm Bureau Day

9:30 a. m., H. P. Stapler presiding—Serving the California Farmer, R. N. Wilson; W. H. Walker, president, California Farm Bureau Federation. Problem of Old Orchard Decline—Deciduous, F. B. McKevitt, president, Producers' Fruit Company. Discussion, P. M. Baier, A. B. Humphrey. Citrus, C. C. Chapman. Discussion, A. D. Shamel, plant physiologist, U. S. department of agriculture; C. B. Messenger, editor, California Cultivator.

1:30 p. m., H. J. Ryan presiding—The California Farmer, Dr. Thomas F. Hunt, dean, college of agriculture, University of California. Long Pruning, Dr. J. C. Whitten, professor of pomology, U. of C. Discussion, G. P. Weldon, pomologist, Chaffey Union High School.

California Cultivator

Vol. LVII, No. 16 | Los Angeles, October 15, 1921 | One Dollar Yearly

A Great Week for California Horticulture

A SHOWING of California horticulture and California flowers will open in Los Angeles next Thursday, in which there will be quality and quantity we believe never before surpassed. California Association of Nurserymen began planning for this show a year ago and some six or eight months ago began actual planting of trees and bulbs and seeds which would lend a charm different from that of any former show to this event. Artists and decorators have been busy working out novel attractions and lighting schemes which will make the show worth a long trip to see.

In addition there will be addresses, discussions, banquets and meetings which will inspire agriculturists to greater and better production. Director Hecke and Deputy Killingsworth, together with Messrs. Strong, Vary, Ryan and a host of others, are working out details for the state fruit growers' convention.

Beside the direct plans for the program and good things of the conventions and the show, it is due to Cultivator readers to be informed of some of the other attractions in Exposition Park, where the conventions will be held. Some of these are outside the gates of the show and well worth a few hours of the time of the convention attendants. First there is the Los Angeles County museum and art galleries containing, in addition to many works of art, one of the world's finest exhibits of prehistoric life, specimens having been taken from excavations in the brea beds west of the city. Then the state exposition building adjoining contains one of the most exquisitely staged exhibits of California fruits and crops which we believe has ever been put up. The interior decorations and arrangements in that building have been under the general direction of Mr. Harris and a governing board. Some of the art work by Miss Lena Scott, Chris Seimer, Edward Vysekal and Ignace Vysekal are worthy of more than a passing look, which we fear will be all convention attendants may have to give to this magnificent exhibit. Anyone who may wish to start right in doing these exhibits should step to the information desk and ask Miss Esterly where to find the work of these artists and decorators. The fair decorations and management have been under the supervision of F. M. Renfro.

* * *

By R. M. Teague

The California Flower and Horticultural Exhibition, together with the conventions of nurserymen, florists and fruit growers, should be the means of bringing nurserymen and planters closer together.

In the past the planter has considered the nurseryman as more or less of a necessary evil, and there may indeed have been just ground for this feeling in some instances, but the nurserymen of today realize more fully the necessity of giving the planter stock that will not only please at the time it is purchased but will produce fruit or flowers better, if possible, than he expected.

There should and we believe there will exist a much closer cooperation between nurserymen and planters when the latter more fully realize the efforts being put forth and the painstaking care exercised by the nurserymen to produce better trees, plants, flowers and shrubbery, and it is one of the aims of this exhibition to show to the public what progress they have been making along these lines.

California owes her reputation as a fruit producing state and a great part of her floral beauty largely to the efforts of the nurserymen, for while these efforts have been prompted more or less from the standpoint of commercial gain the nurserymen have never lost sight of the fact that to attain this end they much produce something better, flowers and shrubs more beautiful, trees and plants more prolific and fruits of better quality; all of which tends to elevate the floral and horticultural industries.

That their efforts have not been in vain will be attested by the great wealth of fruit, flowers, trees, plants and shrubbery displayed at this exhibition.

* * *

By J. E. Bergtholdt

To the fruit growers of California there will be offered in the Nurserymen's Convention, in the floral, ornamental and commercial horticultural exposition put on by the nurserymen, and in the Fruit Growers' Convention during the last three days of the exposition, a full week of events and attractions, unique, educational and profitable, that will make this convention well worth attending.

In the ornamental and floral show the nurserymen are staging the most comprehensive exposition of this kind ever attempted in the state, while on the program of the Nurserymen's Convention held during the first three days of the exposition, every topic will be of vital interest to the fruit grower, and the Fruit Growers' Convention, held during the last three days of the exposition, is of like practical importance.

These are three big reasons why every fruit grower in the state should attend these three big horticultural events staged in Los Angeles the week of October 20 to 26.

* * *

By J. A. Armstrong

It occurs to us that the Flower and Horticultural Show will be a benefit to all the nurserymen of the state, inasmuch as such displays always create an interest in planting. It is true, however, that this show, on account of being rather late, will not have a display of fruit such as might have been displayed earlier in the year. Therefore, this show will more particularly stimulate the planting of ornamentals and flowers.

Such a show should be held at least once each year in California. We are just a little slow in arranging for exhibitions of this kind, as nowhere else can fruit and flower exhibits be made so exceedingly interesting as in our own state, and we anticipate that this year's show will be a starter to big things in the future.

* * *

Wm. T. Kirkman, Jr.

The importance of the nursery industry is being recognized more and more each year. Investors on horticultural projects are not now quibbling about quotations, such as in times past, but are looking toward quality and dependability of nursery stock. This is being evidenced continuously and it is our hope to make good in our endeavor to meet the fruit grower in his demands that we supply nursery stock that is as high grade as it is possible to produce.

The Bud Selection Association is making steady and assured progress and within reasonable length of time will add greatly to the dependability and quality of deciduous nursery stock. A little later we will be able to give more information regarding recent developments and undertakings of the association, which I am certain will be highly gratifying.

CALIFORNIA NURSERYMEN'S ASSOCIATION CONVENTION PROGRAM

Meetings will be held in Armory Hall, Exposition Park, L. A. headquarters, Hotel Hayward.

Thursday, October 20

9:00 a. m.—Address, President R. F. Wilcox. Los Angeles' word of welcome, Sylvester Weaver, president Chamber of Commerce. Response, Wm. M. Bowen, chairman Los Angeles Park Commission. President's annual address. Reports of the secretary and committees. Legislation, J. E. Bergtholdt; Insects and Disease, George H. Hecke; Transportation, J. D. Meriwether; Deciduous Fruits, William T. Kirkman, Jr.; Citrus and Tropical Fruits, R. M. Teague; Viticulture, M. R. Jackson; Gardens, Donald McLaren; Plants and Flowers, W. B. Clarke; Native Vegetation, Theodore Payne; Arboriculture, John J. Reeves; Nomenclature, Ernest Braunton; Exhibitions, D. W. Coolidge; Program, E. B. Washburn.

1:30 p. m.—The Bergtholdt Plan, J. E. Bergtholdt; The Nursery Industry and Taxation, Elwell D. Moore; Nurserymen's Bud Selection Association, William T. Kirkman, Jr.; Quarantine No. 37 and the Plant Industry, R. Kent Beattie; Can California Supply the Plants Formerly Imported?, W. B. Clarke.

7:30 p. m.—The Commercial Plant Industry, a Picture Story. Short addresses by C. B. Weeks of Bud Selection Association, William T. Kirkman, Jr., Ernest Braunton, John Bodger and others. Divisional sections: Fruit Trees, J. E. Bergtholdt, chairman; Ornamental Plants, W. E. Clarke, chairman; Florists, George F. Otto, chairman.

Friday, October 21

9:00 a. m.—Growing Plants and Flowers Under Glass, Walter Armacost; The Need of the Landscape Architect, O. W. Howard; Magnitude of the California Seed Industry; John C. Bodger; Salesmanship and Credits, E. W. Horton; The Regular vs. the Japanese and Amateur Nurseryman, J. W. Barnicott; Future of the Nursery Industry, Max Crow.

1:30 p. m.—Automobile trip for visiting delegates to the growing establishments of Roy F. Wilcox and Company, Howard & Smith, Huntington Estate, Washburn & Bassett. Make auto reservations with A. F. Borden, chairman, 218 West Seventh Street, Los Angeles.

2:00 p. m.—Ladies' auxiliary, place to be announced.

8:00 p. m.—Reception to visitors, Exposition Building, Assembly Hall.

Saturday, October 21

9:00 a. m.—Business meeting, reports of committees, selection of the 1922 meeting place, election of officers.

1:30 p. m.—Auto trip for visiting delegates to Beverly Hills Nurseries, the plant of Armacost and Company and beach resorts.

PROGRAM CALIFORNIA FLOWER AND HORTICULTURAL EXHIBITION

THE exhibiton will be open daily from 10 in the morning to 10:30 in the evening, except on the opening night, Thursday, October 20, when it will be thrown open to the public at 7:30.

Thursday, October 20, Opening Day. Exposition Open to Public at 7:30 P. M.

7:30 p. m.—Opening ceremonies on stage in floral department. Short addresses by prominent Californians.

8 p. m.—High class vaudeville and musical program.

Friday, October 21

Rotary, school children, Pasadena and Woman's Club Day. Rotary Clubs of Southern California will assemble on the grounds at noon for luncheon and joy session.

Saturday, October 22, Los Angeles County and Avocado Day

6:30 p. m.—Official banquet of show at Ambassador hotel.

Sunday, October 23

All-California Day.

Monday, October 24

Motion Picture Day.

Tuesday, October 25

Beach Cities Day.

Wednesday, October 26

Home Day. The lights fade at midnight.

Note—Certain days will be designated as Rose Day, Dahlia Day, Chrysanthemum Day, etc.

A pleasing program of high class entertainment, consisting of vaudeville, music and so on, will take place from 2 p. m. to 5 p. m. and 7:30 p. m. to 10:30 p. m. each day.

THE STATE FLOWER SHOW

By Ernest Braunton

Several hours spent in careful examination of the grounds and plans of the California Flower Show and Horticultural Exhibition to be held in Los Angeles, October 20-26, thoroughly convinces the writer that it will be many times as large as the best yet staged west of Chicago, and in importance, as well as spectacular features, will far surpass anything ever dreamed of in the western half of the United States. While directly under the control of the California Association of Nurserymen, held at the time of their annual convention, other organizations contributing or holding their conventions during the same week and in the same building are many.

Opening on Thursday, October 20, the nurserymen will first hold their convention. The California Avocado Association will hold its semi-annual meeting at 1:30 p. m. in the State Horticultural Building, October 22, and its banquet the evening of the same day at the Ambassador Hotel. This banquet will this time have an added significance for it will be the official "feed" of the Flower Show. The speakers will be chosen from the ranks of the various organizations taking part in the great exhibit. The noted autumn flower show of the Pasadena Horticultural Society will become but a part of the greater show. The California Fruit Growers convention will open Monday, October 24, at 9:00 a. m., under the gavel of State Director Hecke. The convention of the county horticultural commissioners and others will follow.

The grandest outdoor floral display of western America will be seen covering the entire seven acre sunken garden of Exposition Park, to which nurserymen and florists from all parts of the state have contributed. Already in full blossom the thousands of plants present a truly gorgeous array of colors and have been so cared for that they have been "timed" to be at their best during the show week. In the center of this sunken garden is a fountain basin 100 feet in diameter from the edge of which several hundred jets will send their waters 30 feet into the air, while fewer and larger "squirts" form a pyramidal aqueous centerpiece with one gigantic column of water as the fountain center. All this is driven by engines specially installed in underground vaults. There too, is the electricity generated for the thousands

(Continued on Page 411.)

Agricultural News Notes of the Pacific Coast

Northern California

November 21-26, dates of Oroville's Orange and Olive Exposition.

Some sales of seed rice have been made at Willows at three cents.

Six power plants are proposed for the north fork of the Feather River.

Sale of 600 bags of rice at $3 per 100 is one of the first reported for the new crop.

The recent hot weather favored an especially luxuriant growth of alfalfa in the Sacramento Valley.

The California Prune and Apricot Growers has been loaned a million and a half dollars by the war finance corporation.

The farm home department of the Livermore center held a hat and dressmaking meeting last Tuesday afternoon.

The Butte County farm bureau made tour of observation of the plant introduction gardens at Chico on the last day of September.

Livermore Valley of Alameda County reports the hot weather has ripened grapes rapidly and picking is proceeding satisfactorily.

Prune growers of Corning, Tehama County, have harvested a crop of about 4000 tons and there is talk of establishing a packing house to care for future crops.

The cannery at Decoto, Alameda County, has been sold to K. Hovdon, a packer of Monterey and San Diego. The Decoto cannery is now working exclusively on apples.

The state forestry board is cooperating with the Yolo County supervisors in the planting of trees on an additional 50 miles of county highways. Fifty miles already are planted.

The third special silk train to leave San Francisco over the Southern Pacific lines within a month went east this week, carrying 131 tons of silk, valued at well over a million dollars.

The Anti-County Division League has been formed to oppose the proposed charter of city and county consolidation. Membership is found not only in Oakland but all sections of the county.

Local meetings of Tehama County farm bureau: El Camino, 17; Henleyville, 18; Corning, 20; Bend, 21; Los Molinos, 24; Liberal, 27; Bowman, 29; directors, Red Bluff, 22, 10 a. m. All other meetings, 7:30 p. m.

The Stockmen's Protective Association of Livermore Valley held its final meeting of the season at Livermore October 2. L. Bristow of Stockton, secretary of the Central California Wool Growers' Association, addressed the meeting.

Manager Inman of the Pacific Rice Growers Association says he has been advised by the war finance corporation that funds will be advanced to Sacramento Valley rice growers only on condition 70 per cent of them work together in one organization.

Olive growers of Placer County have made arrangements to handle their olive crop cooperatively. County Agent McCallum called growers together to discuss the proposition at the Placer County Canners Association office at Lincoln. F. W. Cornell of the Wyandotte Olive Growers Association told of success of that organization in Butte County.

Central California

Citrus growers of Lindsay, Tulare County, are talking over possibilities of a citrus exposition there.

Kern County farm bureau will picnic at Sweitzer's Grove near Bakersfield today, Saturday, October 15.

The California Peach and Fig Growers has two large canning plants where fresh figs are put up for later market.

The Tulare County Grange held its annual picnic on the occasion of the dedication of Cutler Park last Saturday, October 1.

Mendota, Fresno County, reports cattle and sheep feeding on stubble; very little plowing begun yet; pastures fair but ranges poor.

"Rainmaker" Hatfield is said to be offering his services for the coming wet season to the grain men of Kern and Tulare Counties.

The case of the Tulare irrigation district against the Lindsay-Strathmore district has been reopened at Visalia. Judge Peter J. Shields is trying the case.

The Kerman, Fresno County, Chamber of Commerce bought 1000 sweat boxes to assist local ranchers to ship their own raisins, the raisin company opening a special receiving station.

More than 80 per cent of the peach and fig crops of the valley have been received at the packing houses of the California Peach and Fig Growers' Association, according to J. F. Niswander, vice president and general manager.

More than $6,000,000 will be paid out on November 15 by the California Associated Raisin Company to its members in final payment of the 1920 crop. This will bring up the total payment to $37,000,000, or rather more than the 1919 total.

Over 90 per cent of users of water from the Kings River, representing 1,200,000 acres, have reached an agreement on future division of water rights. This, in the opinion of experts, makes the big Pine Flat irrigation project immediately practicable.

One hundred and ten thousand people attended the Fresno District Fair during the week ending October 1, or about 10,000 less than last year. Financial obligations will be met, announced Manager H. E. Patterson, who is to be congratulated under the circumstances on the satisfactory results.

Revised crop estimates by the California Peach and Fig Growers, Inc., place the total peach crop of the state at 20,000 tons, of which the association will handle 16,000 tons. Fully 75 per cent of the new crop has been sold, according to J. F. Niswander, general manager, on a basis to the grower of from 9 to 10 cents.

Commissioner Beers of Merced County reports: "More fruit trees and grape vines have in all probability been planted in Merced County in the last two years than in any other county in California, with one exception. The fruit industry is the most important crop in the county. Vegetables have become of great importance also. According to figures furnished by the county assessors, Merced has more acres planted to alfalfa than any other county in the state."

Southern California

Unsettled weather held up bean threshing for a couple of weeks.

1500 acres of pimientos are ready to be harvested at Garden Grove, Orange County.

The Coachella Valley Grape Growers Association has filed articles of incorporation.

A Blythe pomegranate grower has sold his entire crop at $90 a ton, f. o. b. Blythe.

The Mohave Valley Fruit Association shipped a carload of fruit from Victorville last week.

Levees along the San Jacinto river are being repaired. No new piling is being driven, but much brush work is being done.

The Orange County farm bureau is working to secure location of terminal elevator of the California Grain Elevators Corporation.

More than 3,700 tons of peaches and apricots were processed at the California Growers Association cannery at Hemet this season.

Due to expiration of many Japanese land leases there is an increase in number of Americans growing lettuce in Imperial Valley this season.

Plantings of lettuce in Imperial Valley are between 12,000 and 14,000 acres, with Brawley district showing greatest increase over last year's acreage.

Imperial Valley has a blackbird, as well as a duck, control committee. It is asking the U. S. biological survey to help drive them from the grain fields.

The Associated Chambers of Commerce of Orange County are asking Orange County people to demand of grocery stores Orange County made beet sugar.

Orange County's Valencia crop next year promises to be ten per cent greater than last year, according to district freight and passenger agent of the Southern Pacific.

R. E. Nebelung, formerly adviser of San Bernardino County has sailed for Pretoria, South Africa, where he will be engaged in citricultural work for the government of South Africa.

Directors of the Orange Belt Honey Producers Cooperative Exchange met October 5 to discuss terms of contract with the state association. The old contracts expire January 1, 1922.

The walnut packing house at Garden Grove, Orange County, opened October 1 and shipped the first week two cars of whole nuts, one to Trenton, New Jersey and one to New York City.

The Riverside County supervisors have given assurance that the bad piece of road between Indio and Palm Springs will be put in good shape before the date festival at Indio, October 21-23.

Fifty officers and members of the Northern Orange County Citrus Association met at Fullerton last week to discuss proposal to have the Citrus Exchange buy six army transports to use in carrying fruit to the Atlantic coast.

Effort will be made by the state department of agriculture to form a permanent quarantine committee of the railway companies to work with the plant quarantine officers of the states comprising the membership of the Western Plant Quarantine Board.

The Coast and General

Yakima, Washington, is sending out several carloads of pears weekly.

Some damage to vegetables was done by early September frosts in the Hood River Valley of Oregon.

Hawaii shipped to the United States during last August 25,100 pounds of honey; Porto Rico, 62,309 pounds.

Lewis County, Washington, claims the largest number of federally accredited herds, 12, of any county in the state.

The West Virginia Farm Bureau Federation has 15,000 members who last year cooperated in marketing wool and potatoes and in buying fertilizer.

Unusually heavy rainfall was reported last week by observers of the weather bureau at Grand Canyon, Prescott, Seligman, Williams and Yuma, Arizona.

Over 700,000 cows are owned by members of the New England Milk Producers' Association. It handles between $1,500,000 and $2,000,000 worth of milk per month.

The annual meeting of the National Grange will be held at Portland, Oregon, November 16-25. A special train will leave Boston, November 9, gathering delegates as it moves westward.

The grape growing possibilities of the Yuma and Gila Valleys of Arizona have been investigated by a number of Fresno County, California, grape growers and favorable report made.

Recent rain in the Salt River Valley of Arizona was not sufficient to cause damage to the cotton crop other than a few days delay in picking; the date crop, however, was slightly damaged.

A carload of cantaloupes was shipped from Nevada to the San Francisco market last week. They were grown in Churchill County on what is known as Uncle Sam's $9,000,000 farm, a government irrigation project.

While cotton in the Salt River Valley of Arizona has improved greatly since the latter part of August, the crop, owing to much shedding in July, will be considerably below the average. Picking and ginning are just getting a good start.

Fruit growers of Colorado, Idaho, Oregon and Washington are much encouraged with the market outlook for their crops this year. Late estimates for the Eastern crops are greatly reduced, and recent reports from England's apple orchards show only 30 per cent of normal yield.

Apple shipments from the Wenatchee Valley for this year are estimated at between 15,000 and 16,000 acres, as against 9464 last year and 12,350 for the banner year of 1919. During 1919 apple shipments from the Yakima Valley were 11,500, and 9522 cars in 1920. This year between 12,000 to 13,500 cars are expected to move out of that territory.

The rainfall in Tillamook, Oregon, for the year ending September 1, 1921, according to the report of the local weather office, was 152.2 inches. This is the greatest year's rainfall ever recorded at any station in Oregon since the state has had the government weather service. The greatest previous reported was 151 inches, several years ago. For the year ending September 1, 1920, Tillamook had 67.5.

California Leads in Hops

By E. Clemens Horst in San Francisco Business

HOPS have for many decades been one of California's agricultural specialties. Even with prohibition generally enforced throughout the United States, California last year produced about 21,000,000 pounds of hops, which were sold for approximately $5,000,000.

California is the greatest hop producing state of the Union in point of tonnage and the greatest in the world in average harvest per acre and modern methods of culture. In the harvesting of hops California has made the greatest advance in that it has developed the hop picking machine which is now used on many of the large hop ranches, not only in California but in other parts of the world. This is one of the most elaborate and at the same time most efficient of the labor saving machines employed in agricultural industries.

Harvesting

When hops are picked the vines are cut from the trellis and hauled in wagons to the hop picking machines where they are fed into the machines at the rate of about 12,000 vines per ten hour working day, which means the picking of about 50,000 pounds of undried hops per day. The labor saving by the machine figures roughly about 10 per cent of what would be required to do the work less satisfactorily by hand.

After the hops are picked, they are laid on the kiln floors or drying floors where they are kept 12 to 24 hours for drying. They are then moved into cooling houses where they are kept for one or two weeks' time and put into bales weighing about 200 pounds each. For export business these bales are very frequently recompressed into bales of one-half to one-third their original size. This recompressing not only better preserves the hops but also effects a very substantial saving in freight rates.

Regarding the rank among the four states which grow hops on a commercial scale, California is first, Oregon second, Washington third, and New York fourth.

The average production per acre in hop growing is officially reported as follows: England, 900 pounds; Germany, 500 pounds; United States, 885 pounds; California, 1500 pounds.

California grows successfully hops of every known variety. The richness of California soils, especially its creek and river bottom lands, where all its hops are grown, has always resulted in large yields per acre.

The dryness of California's climate has guaranteed its hop harvest against loss from the many hop pests that frequently destroy the crops of other districts in the United States as well as foreign crops. The abundance of water in all the hop growing districts of the state has guaranteed growers against the loss or serious shortage of their crop by drouth.

During the whole history of the industry in California there has never been a serious crop shortage although hops are one of the most hazardous and difficult crops to grow. It is because of this reasonable certainty of success that this industry has developed in California to its present extent, in spite of the wild fluctuations in hop prices and the frequent condition of prices being far below the cost of production.

Hop growing is intensive farming of the highest type. The cost of production is almost entirely for labor. Few, if any, crops require as many days' labor per acre to grow and harvest as are required for hops. Though California has never had more than 15,000 acres in hop culture in any one year, it has taken the equivalent of 400,000 days' labor simply to pick, dry and bale a season's crop from that acreage. To this must be added the cost of growing the crop, which requires almost daily attention, for every vine in the pruning, tying and training of the same.

In richness of essential qualities of hops the California product is in a class by itself. In soundness, that is, freedom from blight or disease, it is unequaled. In methods of culture the California hop growers have set the highest standards in the world.

When hop prices are high the profits on hop growing are fabulous. Some of the best lands produce as much as 2500 pounds of dry hops per acre, and when, as last year, hops sold at $1 per pound, it was equivalent to a gross revenue of $2500 per acre. Unfortunately, however, it too frequently happens—as is the case at the present time—that the cost of production is far in excess of the price to be realized from the crop, and in those cases the losses are so severe that few hop growers are able to stand the strain.

The counties which lead in California's hop production are Sacramento, Sonoma, Mendocino, Yolo, Tehama, Yuba and Placer.

In the Workers Camp

Hop growing has, of course, been very adversely affected by prohibition, as this has killed approximately 75 per cent of the American market. The outlet for the American crop today is the export market where Californian hops stand in high favor. It may be noted, however, that the principal export market is now in danger of being entirely lost by reason of our principal customer, England, having placed an embargo against the importation of all foreign hops, except by licenses which are only occasionally given, and it is doubtful to what extent future licenses will be issued. The policy of England is to build up the hop industry within its own country, so as to supply its own market from its own production.

The 1921 hop crop in California on July 1 was about 80 per cent of the normal as compared with 92 per cent over a ten-year average. Production this year should be about 16,000,000 pounds, as compared with 21,000,000 pounds in 1920.

Because of the medicinal value of the resins, tannins and other chemical constituents of hops, they are frequently prescribed by physicians for many ailments, particularly for hot hop compresses and for harmless sleep producing results. They are also used as an essential ingredient in most forms of yeast for bread making.

Few crops in the world are more picturesque than hops. The vineyards of Spain, grown on tall trellises, might compare with them in charm to the eye, but hops with their large lobed leaves of beautiful green, and their profuse green and yellow blossoms, command universal admiration.

Hop picking is a vacation job for many thousands of Californian families each summer. Hop growers provide camping accommodations for this transient labor, and many a city family turns vacation time into real money, beside returning to accustomed urban labors with renewed health and vigor.

The hop is a member of the hemp family. The root is perennial. It sends forth several rough, harbaceous twining stems which are trained on twine to an overhead wire trellis about 18 to 20 feet from the ground, supported by posts at regular intervals.

POTATO GROWERS CONFERENCE

By R. G. Risser, Manager Crop Production Department, California Vegetable Union

A VERY fine series of meetings has just been held for the benefit of potato growers from various parts of the state. A very comprehensive program dealing with many important phases of the potato industry was presented by more than 20 speakers. Unfortunately the attendance was not large and many growers missed the meetings, which were very much worth while. The sessions were held at University Farm, Davis, October 4-5, and at Berkeley, October 6.

One of the first things brought out was the difficulty of undertaking the breeding and introduction of improved potatoes by the individual, and it is hoped that the college of agriculture or the United States department of agriculture will be able to undertake work of this kind for California, as it requires years of effort to accomplish valuable results. The difficulty of distinguishing potato varieties by the type of the tuber was another point which was made quite emphatically, and it was clearly shown that the type was changed under different growing conditions. Difficulties in growing high grade seed potatoes for special localities were also brought out. Confusion resulting from misnaming and renaming of varieties had been the cause of serious trouble in many instances.

The wide differences between the growing practices of producers in different localities of the state became more apparent as the conference proceeded. The use of whole seed grown especially for seed purposes, harvested prematurely and greened before planting was persistently advocated by one of the authorities in attendance but did not meet the popular approval of growers present, who were inclined to consider it an impractical measure. These growers fully recognize the difficulty of getting a good stand of fall crop from new seed and also realize that storing of seed would be expensive. One practice suggested for improving the condition of new seed at planting time consisted of covering the piled potatoes with straw and keeping the straw moist. The cooling effect of this treatment was said to improve the stand by preserving a healthy condition of the tuber. The importance of having the soil cooled by thorough irrigation prior to planting was also emphasized as a means of promoting a good stand. On the whole, this problem of stand of fall crop was regarded as one of the most serious ones needing solution.

Various diseases received lengthy discussion. The shoestring disease, which was common in 1920, was attributed to high temperatures occurring when fields were slightly short of moisture, particularly upon varieties obliged to support a large leaf surface or vigorous top growth. Many interesting points were brought out about the nematode, and it was conceded that this pest is the most serious one connected with potato growing. Control of the spread of the nematode was touched upon but no quarantine action was definitely decided upon as the best means of restricting its progress. Methods of protecting potatoes from attack by tuber moth were fully explained. Deep planting, thorough hilling, prompt digging, and expeditious delivery to the cars were recommended. Much damage and loss may be avoided if these suggestions are carefully followed.

The use of mineral fertilizers liberally applied, of special deep tillage implements, and of planting, digging and ditching machinery were features of the new type of potato farming inaugurated in the Delta so successfully by Fred Rindge. The practice of subirrigation and the use of different varieties of seed were other topics of special concern to the Delta grower.

The work of the farm bureau was very ably presented. In the course of the remarks meetings which considered freight rate reductions were mentioned and the part played by Thomas O'Neill, president of the California Vegetable Union, was brought out.

Something of the significance of the potato as a world food product was discussed and the paramount position of this crop in the dietary of the European nations was considered in connection with the support of the thickly populated regions of that continent.

The grading of potatoes by the associations in Southern California was reviewed with considerable satisfaction. The opinion of the trade which handled these graded potatoes was extremely favorable towards the new practice and enthusiastic regarding its possibilities.

potatoes was shown by maps and charts and it was readily seen that the task of properly distributing a potato crop was one which was very complex, requiring for best results a thorough and up-to-the-minute knowledge of the situation, based upon adequate telegraphic advices from personal representatives in the producing and marketing centers.

The last speaker mentioned the disorganized conditions which have existed in certain sections amongst growers where buyers had pitted one grower against another in normal times and left the district uncared for when there was no opportunity to make a profit by speculating on the crop. The present tendency is toward organization, standardization and better business practices in handling potatoes.

On the whole a great deal of information was gained by the exchange of ideas and D. H. Carey of the university deserves credit for arranging an excellent program.

FERTILIZING WALNUTS

By Ernest Braunton

Ralph McNees of Whittier has one of the best walnut orchards in his district. The older planting of 30 acres is just 30 years old. In years gone by this orchard was noted for its production record. It is not less vigorous today but it is not fed so heavily as in former times.

"There was a time," said Mr. McNees, "when I could get barnyard manure for the hauling and every part of the orchard had a good covering every year just when the trees were at the most susceptible or impressionable age. Now I buy 500 to 600 tons each year and aim to get over every part of the orchard at least once in three years. This supply is supplemented each year with a cover crop of melilotus, which gives me more humus and more nitrogen, and for solid food I feed phosphate, acid phosphate.

"I have found phosphate pays well, gives good returns—better crops. It also counteracts perforation, for where I have given the most phosphate I am sure I have the least perforation. I have been applying but 500 pounds per acre, usually broadcasting it, especially if I expected to work the soil shortly afterward. If not it should be drilled in or applied as Shamel recommends with manure, in deep furrows. I usually apply it in November, although it would be as well given right now, but at present I lack the necessary time.

"I sow melilotus in September; you will notice how the late rains brought it up. I sow from 15 to 20 pounds to the acre. As soon as leaves fall and light gets into the old orchard it will commence to grow rapidly but it should have an early start. When my nut crop is off my hands I shall furrow for irrigation and broadcast the usual amount of acid phosphate. The rains, on the whole, have been beneficial. While the nuts are now slightly discolored, the bleach will remove all that. The hot spell resulted in many "stick tights" or tight hulls, which the rain loosened considerably. Rains also boosted the cover crop into a good start, phosphate will give it another and soon it will grow out and cover the irrigation furrows I shall make when this nut crop has gone."

CALIFORNIA CITRUS GROWERS INDORSE PRODUCERS STEAMSHIP COMPANY

Approving the recommendation of the water transportation committee of the California Fruit Growers Exchange that a producers' steamship company for the transporting of citrus fruits from Los Angeles harbor to Atlantic Coast ports be organized, the board of directors of the exchange has taken official action indorsing the project and authorized the management to secure contracts for a minimum of 2,000,000 boxes of fruit for water shipment.

The plan for the organization of this new steamship line, which will be called the Producers Steamship Company, provides that the citrus growers of Southern California shall enter into contracts covering a period of three years guaranteeing a yearly tonnage of 2,000,000 boxes or 5,000 carloads of citrus fruits by the water route to the ports of Boston, Philadelphia and New York.

According to C. S. Whitcomb, chairman of the water transportation committee, these contracts are necessary as a foundation for the securing of the $2,000,000 needed to finance the first three years' existence of the company.

"It is expected," said Mr. Whitcomb, "that the majority of this stock issue will be subscribed for by the grower members of the California Fruit Growers Exchange, as it is the citrus grower primarily that will benefit by this producers steamship line operating out of Los Angeles harbor.

"The $2,000,000 received at this time from the sale of 20,000 shares of this stock at a par value of $100 per share will be used for the organization and preliminary work: the erection of a pre-cooling plant and wharf at San Pedro, trucking equipment, chartering of six fast ships, and the securing of adequate terminal facilities at Philadelphia, New York and Boston.

"Our plan," said Chairman Whitcomb, "provides that the Producers Steamship Company shall render exactly the same service to the shipper that the railroads now furnish. The steamship company will send its trucks to take and receipt for the fruit at the door of the packing house of the shipper, transport it to San Pedro, place it in a pre-cooling plant at the dock,

Home Made Olive Oil

FOR something like 2,000 years we have been producing olive oil and processing in much the same way. The principal factor in its manufacture is absolute cleanliness; if that is observed the exact steps to take are not material. However, this paper has given in preceding years an article written for the Cultivator by W. V. Cruess. It has already been repeated once by request and now comes suggestion that its value may be as great for oil producers as at that time.

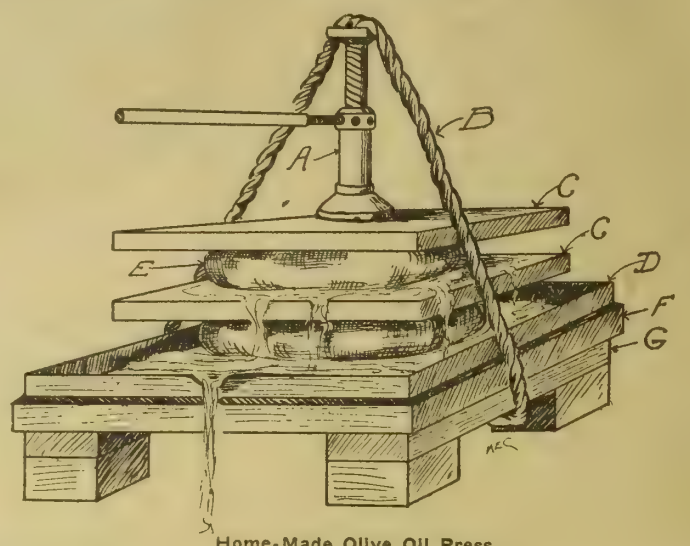
By W. V. Cruess

There is no thorougly satisfactory way of making olive oil upon a very small scale without expensive machinery. The methods described below are the best that we have been able to find or devise for small scale use, but the yields of oil when compared with commercial factory yields are low. The necessary utensils can be found on any farm.

Extraction of Oil Without Pressure

A pound or two of ordinary lye, such as Babbit's, Red Seal or Greenbank's lye, will be needed. Make up a solution of the lye of one-half pound of the lye per gallon of water, using an agateware or iron pot. Do not use your aluminum ware; it will dissolve in the lye. A small basket of wire screen such as is used for making French fried potatoes will be needed or a piece of cheesecloth can be used

Heat the lye solution to boiling and while it is boiling dip the olives in it for about 20 seconds. The time will vary with the toughness of the skins. Leave the olives in the lye until the skins are softened; that is, practically dissolved. Then plunge them into cold water for a few seconds to check the action of the lye.



Home-Made Olive Oil Press
Plan and drawing by Prof. W. V. Cruess. Specifications in Prof. Cruess article.

Place the lye treated olives in a piece of fly screen tacked to a frame over a large dishpan. Rub them on the screen until the flesh has separated from the pits and dropped through the screen into the pan. A heavy pair of gloves is useful in this process to prevent the hands becoming badly stained and roughened by the lye and olive juice.

Place the pulp, which should now be of a pasty or mushy consistency, in a pot with about two or three times its own volume of water. Heat while stirring to the simmering point for about one-half hour. Set aside for several days to permit the oil to raise to the surface. Usually a fair yield of oil can be obtained by skimming it from the surface of the pulp. The pulp may then be heated to boiling a few minutes with more water and allowed to stand again. The process should be repeated several times. We have obtained about two thirds the yield of oil by this process that can be obtained by use of a commercial press. The secret of success lies in rubbing the olive flesh to a fine grained pulp on a screen.

The oil obtained by this process must be washed and should be filtered as described later in the article. It has been found that the yield of oil is sometimes increased by adding about one-fourth pound of salt per gallon of water used with the pulp. Always use a large excess of water with the pulp, as this facilitates separation of the oil.

Home Made Olive Press

A simple press made from materials usually found about the place is shown in the accompanying figure. This press has been described by F. B. Pinkus in the Olive Journal. The writer has made several modifications in the original plan of the press.

A, heavy wagon or automobile jack. B, small iron or steel cable or chain or heavy rope. C, two pieces 2x2x12 inches. D, shallow wooden water tight tray. E, heavy burlap cloth to hold crushed fruit. F, floor of 2x12 inch material. G, 2x4 inch braces. The tray D and floor F are 16x16 inches.

One of the greatest difficulties will be the crushing of the fruit. This may be done as described for the method above. If this method is used, return pits to the olives before pressing. The olives may also be crushed by placing them in a string sack and hammering the sack with the broad side of an ax or with a heavy board in the same way that ice is crushed in a sack. The fruit must be thoroughly broken up. It will crush better if it is boiled a short time to soften it.

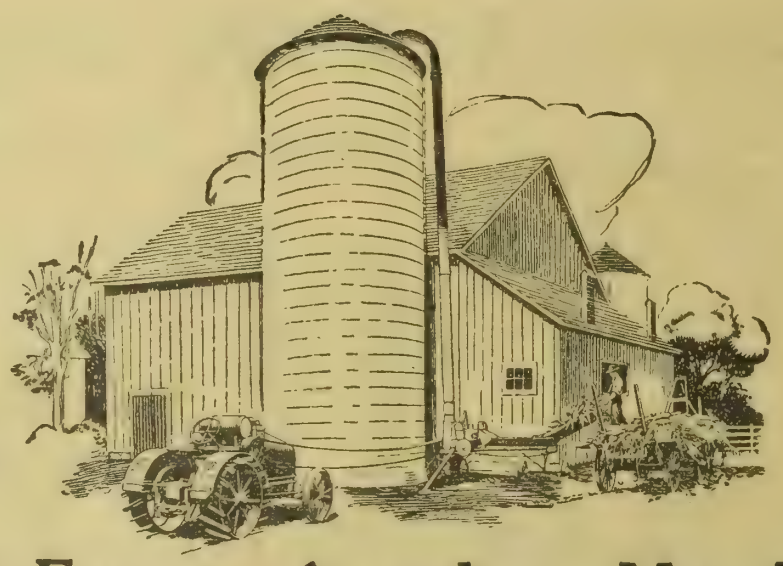
Place the crushed fruit and pits in a piece of heavy burlap and fold the edges of the burlap in to give a press cake about 10 by 10 inches and about four inches thick. Make two of these and place them in the press as shown in the figure. Press slowly until no more juice can be obtained. Save all juice and oil pressed from the fruit. The pressed pulp should now be boiled with an equal volume of water and pressed again. This pressed pulp should again be boiled and pressed. Usually a fourth heating and pressing will pay. Combine all of this pressed liquid and allow it to stand in a tub or barrel over night. The oil can then be skimmed off.

Washing the Oil

Oil obtained by either of the above methods will be bitter and not clear. It must be washed with water to remove the bitterness and rough flavor. To do this first prepare a bucket or five gallon can with a hole and faucet or cork near the bottom. Place the oil in this container and add an equal quantity or more of warm water. Mix oil and water by stirring for several minutes. Allow water to settle several hours. Draw off the water and replace it with fresh warm water. Stir; settle and draw off after several hours. Repeat until the oil no longer has a bitter taste. Usually two days washing will be sufficient.

Filtering the Oil

The oil will be cloudy and mixed with a little water. It can be made clear by filtration. A tin funnel can always be bought from the hardware store. One about seven inches in diameter is a convenient size. Filter paper can be bought from the drug store. Ask the druggist to fold the



Any Farmer, Anywhere May Now Own The International 8-16 Tractor

(Sale formerly limited to certain sections of the country)

IN those states where International 8-16 Tractors have been well known for several seasons they need no introduction. New owners are buying on the recommendation of old users, and on thousands of farms the popular 8-16 may be seen working efficiently, converting cheap kerosene into economical farm power.

If yours is new country for the International 8-16, let the International Dealer show you this adaptable small tractor.

Plowing, disking, seeding, cultivating orchards, hauling heavy loads on road and farm, pulling stumps, dragging roads, drawing mowers, hay loaders, grain harvesting machines; threshing grain, baling hay, cutting ensilage, sawing wood—on all heavy farm tasks where dependable power is required either at the drawbar or belt pulley, International 8-16 Tractors will render you satisfactory service from January to December.

The International 8-16, because of its light weight, snug compactness, ease of control, generous reserve power above its rating for emergency pulls, three speeds forward, economical operation and general fitness for diversified service, is highly popular with farmers in every branch of agriculture.

Sixteen years of tractor building experience and over three-quarters of a century of general farm machine success, backed by a broad-as-agriculture reputation for fair dealing, good quality and dependable after-sale service—these factors are your assurance of satisfaction when you buy an *International 8-16 Tractor.* The International Dealer has the facts as to new lowered tractor prices.

INTERNATIONAL HARVESTER COMPANY
OF AMERICA
(INCORPORATED)
CHICAGO U S A

92 Branch Houses and 15,000 Dealers in the United States

paper for you and tell you how to place it in the funnel.

Place the funnel in a wide mouthed bottle or place a 1 by 3 inch piece of wood over a bucket and bore a large hole in the wood to take the stem of the funnel easily. Pour the oil into the filter paper in the funnel and allow to filter. Oil filters slowly. Do not become discouraged if it requires several days for it to run through the filter.

Olive oil is not fit to use as soon as it is made. It should be kept for at least one year before it can be expected to have the proper flavor. Keep it in well cleaned bottles away from bright light. Too much light will cause it to lose color and flavor. A warm room will cause it to age more rapidly. The oil will also age more rapidly if the bottles are only three-fourths full and if a small piece of cotton is used to close the bottle.

FRUIT TREE IRRIGATION IMPORTANT

Attention of deciduous fruit growers particularly is called to the importance of providing deciduous fruit trees with an ample supply of soil moisture during the months of September and October. Fruit bud differentiation is occurring at this time and if the trees suffer from lack of moisture it is certain to result in weak fruit buds for next season's crop. Many orchards have been observed where the trees are now evidencing distress from lack of moisture, and borings in many orchards have indicated that the soil moisture content is getting very low. This is the critical season of the year for deciduous fruit trees, and permitting the trees to suffer from lack of moisture at this time cannot be offset by good pruning, adequate pest control or any other measures. In fact, permitting the trees to suffer during the period when fruit buds are being formed will largely vitiate whatever results might have been secured through improved pruning. Growers are therefore warned against permitting the soil to become too dry.

PRUNE GROWERS REORGANIZE

The California Prune and Apricot Growers Association, the reorganized California Prune and Apricot Growers, Inc., which represents more than 82 per cent of the prune acreage and 75 per cent of the apricot acreage of the state, officially came into existenee with the first meeting of its voting board at San Jose in September.

The 39 members of the voting board, chosen by popular election last June, elected 14 directors for the new association and directed them to proceed with the incorporation of the association. The new directors are: W. A. Yerxa, Princeton; Lloyd H. Wilbur, Yuba City; Henry Wheatley, Napa; Mark L. MacDonald, Santa Rosa; Geo. C. Alexander, Healdsburg; H. G. Coykendall, Cupertino; T. S. Montgomery, San Jose; A. Kammerer, San Jose; J. O. Hayes, San Jose; C. D. Cavallaro, San Jose; W. R. Kingston, Ventura; C. G. Hamilton, Hemet; Arthur Swall, Tulare; H. C. Dunlap, at large.

The voting board also approved the nomination of W. G. Alexander of San Jose as the representative of Governor Stephens on the board of directors of the new association. The voting board chose Irwin E. Pomeroy of Santa Clara as permanent chairman of the new board and made Martin J. Madison of Hayward permanent secretary. Both of these men occupy similar positions on the board of trustees of the present association. Sheridan W. Baker of Santa Rosa was elected permanent vice chairman of the new voting board.

The old association will continue in existence until the 1921 prune and apricot crop has been completely cleaned up. The first crops which will be sold under the terms of the new contracts held by the reorganized association will be the prune and apricot crops produced in the fall of 1922.

NEW YORK APPLES HIT HARD

The apple crop of New York, the leading Eastern producing state, is estimated at 34 per cent of normal, slightly more for Baldwins and less for Spys, while Greenings show only 17 per cent of a crop.

PRUNES IN CALIFORNIA

The agricultural experiment station of the college of agriculture has issued "Prune Growing in California" by A. H. Hendrickson, Bulletin No. 328. It is a 40 page publication filled with information as to prune culture, from planting of seed to harvesting, curing, distribution of cost of production and other features of interest to the prune grower. In addition the station is reissuing Circular No. 212, "Salvaging Rain Damaged Prunes" by W. V. Cruess. Prof. Cruess refers to rain damage to prunes in preceding years and reaches the final conclusion: "Badly damaged fruit should not be thrown away but should be utilized for hog feed, syrup or in some other way." There are many suggestions as to how the salvaging may be accomplished.

TERRACED ORCHARDS AT LA HABRA HEIGHTS

A little to the north of Whittier Boulevard and adjoining the East Whittier district is to be seen one of the latest developments in winter gardening and avocado and citrus culture. American and modern adaptations of European and ancient methods are being strikingly and successfully demonstrated under direction of Edwin G. Hart. Terraced hillside citrus groves, even the steepest slopes of this former sheep ranch, are being transformed into highly productive property. R. L. Reynolds, a large grower of winter vegetables, has 160 acres of hillside now in crops, affording a most striking illustration of the new terrace method. Rhubarb of giant size, peppers, beans, peas, tomatoes, squash and cucumbers are growing where a few years ago it seemed too steep for anything but a sheep to travel in comfort. Near by, Robert M. Teague, a nurseryman of long experience, is demonstrating his faith in the new system by planting 95 acres of similar slopes and hillsides in avocado, citrus and other nursery stock.

Avocados are playing a prominent part in the planting scheme of most of the growers. Dr. Stonebrook has put in 18,000 avocado nursery stock as well as a budded plantation, and Clyde O. Wilcox with only five acres in a little cove near the new Country Club grounds has made a remarkable showing since last spring. Avocados of the Fuerte variety planted in May have grown as much as three feet, seedlings have made two feet and a fine crop of squash and cucumbers has been raised between the rows. Many other holdings are planted in citrus and avocados, winter vegetables and nursery.

BRAZIL NUTS

From time to time we hear of someone who claims to have growing trees, or a tree, of Bertholetia excelsa, that bears the Brazil or Para nut of commerce. Of late a most persistent claim, covering seven years, of the possession of two of the trees, grown from seeds, caused an investigation, only to find they were Mexican avocados. As the grower had reported these trees to the agricultural department at Washington the writer sent in the facts. A portion of the reply of Peter Bisset, plant introducer in charge of this phase of work, is here given.

"We have had a number of letters from people in Southern Florida who claimed to have seen a tree of the Brazil nut near Fort Myers, Florida, but upon inquiry we found it to be something else. There is no tree growing in the open of the Brazil nut that I know of at the present time. The tree is a very tropical one and is seriously injured by the lightest frost. We have tried it several times at our Miami, Florida, garden, and each time it has been killed."

SHORT COURSE IN SPRAYING

A short course in spraying will be given October 13 to November 17 at Chaffey Junior College, Ontario. Meetings will be held on Thursday evening of each week for six weeks, each session to last one hour only. The course will be of a practical nature and is designed to meet the needs of the fruit growers who are constantly facing the problem of insect and disease control by spraying.

Plant an Orchard

Our foothill soil and location produces a tree that for hardiness, good roots, and freedom from disease cannot be duplicated by any other section

Growing fruit is the best paying business in California.

The acid test of any business is not what it will do under favorable conditions but what it will do under adverse conditions.

Even under this year's depreciated values, the orchardist with a block of **Prunes, Bartlett Pears, Apricots, Cherries, Raisins, Shipping Grapes, Clingstone Peaches, Drying Peaches, Fall Pears, Almonds, Shipping Peaches, Shipping Plums, Canning Plums,** and **Figs** will make more money than the grower of grain, hay, alfalfa, beans, rice, or the dairyman.

The trees you plant now will, five and six years hence, assure your share in the profits inherent to the California fruit grower.

The supply of trees in the State available for planting is not over 60 per cent of the trees budded last fall. **This will result in a shortage of some of the best standard varieties.**

We offer for your planting the most complete assortment of commercial fruit varieties.

Our trees are the best that care in propagation and efficient workmanship can produce.

Our catalogue, full of accurate practical horticultural information and suggestions, and our thirty years' experience in fruit growing and fruit marketing, are at your service for the asking.

Submit us a list of your tree wants for quotation while the varieties you desire are still available in our foothill grown stock.

Write me today.

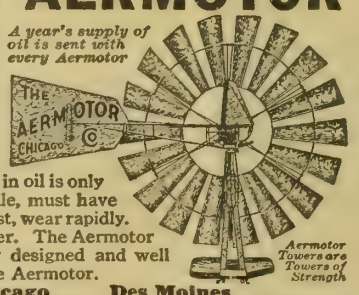
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

A year's supply of oil is sent with every Aermotor



Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Aermotor Towers are Towers of Strength

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fumigation After Copper Wash or Spray

How long should I wait after spraying tree with Bordeaux before fumigation?—Subscriber, Covina.

Where tree is sprayed with Bordeaux a period of 10 or 12 months at least should elapse before fumigation. This, bear in mind, where leaves and all parts of the tree are sprayed. As to fumigation of tree whose trunk only has been painted this depends entirely upon circumstances. A tree weakened by gum or other disease, which has had the entire trunk painted, might require almost as long a period as a tree which has been entirely sprayed with Bordeaux. However, with a strong husky tree which has had only the lower portion of the trunk painted it is possible one might fumigate within a very short time after application of Bordeaux, say a few weeks. If treated in the younger branches, especially the branches of later growth, the time which should elapse between the application and the fumigation might well be about as long as in the first case.

Aphis on Prunes

Can you tell me what is good for aphis on prune trees?—Subscriber, Visalia.

Apply nicotine sulphate as recommended in formulas No. 16 or 30 on pages 313 and 316 of the Cultivator spray special of September 24.

Care of Walnuts

Please inform me how many acres of walnuts and oranges one man is able to take care of well with a very good team and also milk one cow.—Subscriber, Fullerton.

This is a question we will pass on to our walnut growing subscribers. We imagine a canvass amongst the walnut orchards of the state would develop almost as many different answers as growers interviewed. We imagine one would say 10, another 20, and another 40. Presumably the harvesting is not to be included in the care of orchard. That would call for added help. But for plowing, cultivation, hand work where necessary, pruning, spraying, upkeep of parking along the roadway, irrigation, fertilization, how many hours are required for man or team? In dollars and cents Prof. R. L. Adams in his "Notes of Methods and Costs of California Crop Production" says: "Annual upkeep after maturity; fertilizer and manure, $25 per acre; cover crop, $5; plowing and cultivation, $8; irrigation, $4; water, $12; pruning, $3." This publication bears no date but as we recall its estimates were based upon conditions as they were "before the war."

Lupine Seed

Please tell me where I can get lupine seed for cover crop? Is there more than one kind, if so, which is best?—Subscriber, Selma.

Any seed house advertising in the Cultivator should be able to supply you with seeds of Lupinus arboreus, a yellow flowered species, which is probably the best of many for cover crop purposes.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Mineral Rights

If I should find gold on land belonging to someone else could I prove up on the claim without paying the owner of the land?—Subscriber, Lincoln.

It would depend entirely upon whether under the original grant from the government, minerals of the land were reserved. In most instances, however, this is not the case and it would be necessary for you to purchase the land from the owner.

Tax Exemption

Is there a law in this state, giving ex-service men exemption from taxes? If so, what is the exemption and how could I obtain it?—Subscriber, Valley Center.

The state constitution provides that war veterans receiving an honorable discharge, and certain relatives of any deceased war veteran, are entitled to exemption of real and personal property in the amount of $1,000, provided the exemption does not apply to any person owning property of a value of $5,000 or more nor to the property of any person who is not a legal resident of the state. Every person entitled to the exemption must appear before the county assessor and give such information and answer such questions as are contained in the form and affidavits prescribed by the state board of equalization. These forms will be found at the office of the county assessor. This applies to all veterans of wars of the United States and, in fact, many of the Indian campaigns.

Rent in Advance

I rented a house with a verbal understanding that the rent was to be paid monthly in advance on the first of the month. The tenant, however, paid only half the rent and promised to pay the balance in a few days. He has not yet paid it. In the future,

¶

The biggest event of the year.

Admission 50 Cents
Children 25 Cents
No War Tax

if he should fail to pay in advance, how short a notice can be given to vacate the premises?—Subscriber, Exeter.

If a verbal lease for one year of the premises with rent payable monthly in advance on the first of the month in a definite named sum can be proven, then in case of failure to comply with the covenant of the lease, a three-day notice to pay or vacate may be served. In case party fails to pay within the three days, then an unlawful detainer action may be filed either in the justice court or the superior court; if the monthly rental does not exceed twenty-five dollars a month, and in the superior court if it exceeds that amount. If such verbal lease cannot be proven, then a thirty-day notice to vacate should be served and if the party does not vacate within the thirty days then a three-day notice to vacate followed by unlawful detainer action.

Resident of State

What constitutes a person a resident of a state?—Subscriber, Davis.

A resident of a state is one who comes into a state or resides or dwells in a state with intent to make his domicile or permanent residence therein. In order to constitute a resident there must be the union of fact and intent to make a particular state the domicile.

Deed to Church Property

Three church trustees received deed for real estate for erection of church. Deed does not contain amount paid, stating only "for value received." Is such deed legal?—Subscriber, Parlier.

By reason of the rule of law that the statement of the consideration of the deed is never conclusive as to the consideration paid, the majority of deeds executed do not state the true consideration. Therefore, the deed as given in the above question is entirely valid.

Name of Resort

What steps are to be taken when resorts in the same county and on the same highway have the same name?—Subscriber, Placer.

The senior resort would undoubtedly have the right to restrain the use of any trade name which it has taken, by any other resort wherein patrons of the first resort are liable to become mistaken. There are certain exceptions in this respect, however, one of which is that no person can appropriate the exclusive use of a geographical name.

Property in Trust

My property is invested in notes secured by mortgages in an eastern state. Can I legally dispose of my property by assigning these mortgages to a trust company with directions to collect interest and pay to me during my life and at my death to collect the principal and pay to my heirs in such proportions as I may direct?—Subscriber, Turlock.

Such a trust is perfectly legal and, in fact, the trust companies are extensively bidding for this class of business. Their fees would be approximately the same as under the probate laws. In the majority of instances there is no saving made.

Support of Wife

How long is it necessary for a husband and wife to be separated before she can compel him to furnish means of support? The separation was three years ago. The wife resides in an eastern state and the husband in California.—Subscriber, Bakersfield.

Under the California law there is no stated time that the wife is required to wait to require the husband to comply with his marital vows. The writer thinks that there is no specific length of time provided in any of the laws of any state. Many of the states have criminal proceedings making this a felony; if residing in a foreign state the husband may be extradited. If civil proceedings are taken they must necessarily be brought within the state wherein the husband resides.

Foreclosing

Can a mortgagee foreclose if the interest is not paid at the time specified?—Subscriber, Arbuckle.

An answer to the foregoing depends entirely upon the terms of the mortgage. Most mortgages provide that the mortgagee may foreclose immediately upon the failure to pay interest.

Renting to Japanese

Can an American rent land to a Japanese or make a crop contract without infringement of California law? If so, how?—Subscriber, Arroyo Grande.

The alien land law of California provides that in case of the acquisition of any interest of property by one who is ineligible to become a citizen of the United States, that the State of California may bring an action to escheat this interest to the state; that is to say, the state may after the proceeding in law, acquire whatever interest the alien may have in the property. The law does not in terms prohibit or invalidate any transaction whereby the alien acquires such property, or interest therein. The courts have, therefore, held that as between the private individual concerned in the transaction it is valid and enforceable; that the sole party who can step in and take the interest of the alien is the State of California in an action brought in its name. This applies to a cash lease. Whether or not the crop contract is within the provisions of the alien land act so that the state might acquire the interest of the alien is an undecided question.

Removal of Cemetery

What is the gist of the new law pertaining to the removal of old cemeteries?—Subscriber, Wasco.

The act passed by the last legislature deals with cemetery corporations in towns of not less than 100,000 persons wherein burial in the cemetery has been prohibited by ordinances for 15 years or more. It provides a means whereby the cemetery may be abandoned and for the removal of remains to a cemetery outside the boundaries of the city or to a memorial mausoleum. The act is quite long, and detailed, providing for specific notice to be given to all persons interested by publication in newspapers and posting copies of notice and mailing notice to every person who owns a lot in the cemetery. After notice, petition may be made to the superior court, permitting the corporation to dispose of or mortgage property.

Loan to Soldiers

Under the act whereby ex-service men are entitled to borrow money for the equipment of ranches, are they required to have been natives of the state of California? My husband was a native of Illinois, but he bought property in California and we are making it our permanent home.—Subscriber, Vacaville.

The act referred to does not exclude those who have preferred to make their residences in this State than elsewhere, but merely at the time of enlistment, induction, commission, or drafting, the individual who served in active duty in the military forces of the United States in time of war and received an honorable discharge therefrom was, in fact, a bona fide resident of California.

SUCH AS THESE

The little rose that blooms within our garden row
Fills all the walk with sweetness;
The little bird that swings the lilac bloom down low
Sings joy of life's completeness;
The round old sun that rolls up easy, all a-grin,
Warms half the earth with laughter;
The child that looks up startled at our grievous sin
Forgives and loves us after.

All these we love. And so we love those men whom woe,
Experience and wisdom have not yet bereft
Of what we love these for. The merry heart we love,
And him who has a part of childhood's sweetness left.
—Annette Davisson Squire.

HOW THE OLD TOWN HAS CHANGED

By M. O. Holt, in Placer Herald

THE ultimate fate of Michigan Bluff in Placer County is not unlike that of other depopulated mining towns. Thirty years ago, it, with the not far-distant mining camps, was a live town of probably a thousand people. On Sundays when the miners came from Turkey Hill, Sunny South, Deadwood, Damascus and the American River mines, there was life not devoid of excitement.

The early population was typical of the miner. They had to be strong. Muscle was the thing. The miners used to say that their wealth was in their arms and shoulders. To walk to Auburn, a distance of thirty miles, in part of a day was not considered unusual. They had endurance, these sturdy mountain men. They could not be daunted. They hydraulicked off whole mountain sides. To get water they dug a fifty-mile ditch to tap far-off mountain streams. They turned the course of the American River at Horse Shoe Bar by blasting through the horseshoe of bedrock, making a tunnel ten feet high and several score of feet in width, so as to work the river bed. They took mining machinery, stoves and other heavy burdens into far away canyons, where there were no roads, and slid them down to the water's edge. They carried provisions on mule back over almost inaccessible trails far into the mountains. It thrilled the writer, when a boy, to look across the winding El Dorado Canyon trail, to see Alfred Dixon's pack train and to hear the driver's yodeling re-echoing among the mighty hills.

The miners worked underground in foul air and dripping water, wearing rubber coats heavy enough to fatigue the strongest. No wonder their constitutions often broke down early. No wonder that the county hospital later claimed them. But it was the lure of gold. "Just another month and I will break through into pay dirt," was the fervid declaration of many a prospector. The month lengthened to years, the tunnel became sacred, but finally the prospector, bowed down by toil, hardship and privation, found a rest in the county hospital, not having found the treasure he sought for so many years. Still many lived beyond the allotted three score and ten.

During heavy winters sluice boxes were put in the street between Morgan's store and the tin shop to catch gold, which at that time was not so scarce. After heavy rains, schoolboys used to find nuggets in the road at recess.

The products of the gardens and orchards were unexcelled. The mountain air, soil and water gave agricultural products a flavor not to be found elsewhere. For where could be found finer cherries than the great Ox Hearts from Sutcliffe's in El Dorado Canyon, or from Polifka's big cherry tree, from which every boy in Michigan Bluff got his fill? The grapes and the Bartlett pears from Wills' ranch, the blackberries from Mark Beeman's, and the Winesap apples from many orchards were fit for the gods. And in Volcano Canyon grew wonderful wild plums and hickory nuts and thimble berries.

When snow fell to the depth of ten feet and shut the town in, the people were not greatly inconvenienced. Provisions and wood were always provided before snow fell. It was the boyish delight of the writer to watch the janitor at the Phoenix Hotel throw four-foot sticks of spruce wood into the massive heating stove. Men brought the mail daily from Forest Hill on snow shoes. Horses wearing snow shoes replenished supplies. More than one man, attempting to make a trip on snow shoes, died in the snow, his tracks showing his bewilderment before he lay down.

The sports of these virile people required sturdy strength. They enjoyed the snow. They snowballed each other without mercy, and woe betide the person who refused to join in the sport. The hills abounded with deer, and every man hunted them with his .44 Winchester. Little Oak, El Dorado Hill, Cod Fish Point and Dead Horse were favorite hunting grounds. The dances at Phoenix Hotel never stopped at 12 o'clock. The floor and the walls of the dance hall swayed, and not till daybreak did old man Gribben's orchestra cease. Every other dance was a quadrille. And no ball could be held without a chicken or an oyster supper, price $2.50 per couple.

There were peculiar characters among them. Everyone remembers Mike Corcoran, who used to sing over and over, "O why do you tarry and why do you stay, way up in Long Canyon where the diggings don't pay?" There was Gus Harnet, who dug his own grave and gave orders to have his body wrapped in a blanket and buried without ceremony. Everyone remembers good old Duncan Ferguson of Deadwood, Andy Houk of Last Chance and Bob Hill of Birds' Valley. Not a few of the younger generation grew to manhood and womanhood, never having seen a railroad train.

One peculiarity worth mentioning was the division of the people into two factions according to their preferences for doctors. There were the Dr. Mardis adherents and the Dr. Burleigh supporters, neither side of which could see any good in the other's doctor. At times they came to blows when arguing the merits of their respective doctors. However, those who knew these rugged people understood their idiosyncrasies. And this is interesting to the sociologist—they were sound at heart. They helped their fellows when misfortune came. When a house burned the neighbors collected money quickly for the owner, which enabled him to build again.

The Chinese population was large, and among them were Chinamen like Ah Bing, Johnnie Sing and Ah Shoe, for whom the people had real affection, and who were always remembered.

In communities like this tragic events were common. We will pass over shooting and stabbing affairs. With caves and sliding hydraulic banks claiming victims, with accidents at the Big Gun and the Turkey Hill diggings, the lives of the miners were always in danger. Premature blasts blinded or killed. Not a few hunters were mistaken for deer and shot. Stage robberies and sluice box robberies were not uncommon, and more than once the Express box was stolen. Everyone remembers the shrieking forest fire on Gorman's Hill.

However, there was the brighter side to life in Michigan Bluff. There were those whose efforts stood for ethical and spiritual improvement, Mrs. Bowen and Mrs. Van Eman, God bless them, kept alive reverence for the church. They were leaders in Sunday school, in bands of hope, in Christmas festivities and social life.

Surely the old town has changed. Now the inhabitants do not number a score. Buildings have fallen to decay, sidewalks are gone, and almost everything is in ruins. Yet there are a few who hunt for gold, and no doubt gold is there. It is sad for one who spent his boyhood there to go back after twenty-five years and to see this desolation. The younger folk have left, the older ones sleep in the cemetery under the pines.

HINTS FROM HOUSEKEEPERS

Two Good Jerky Recipes

Place amount of jerky wanted in bake pan, dampen with water, place in oven and partly cook, then take out jerky and pound with hammer on a block until it can be easily shredded. Take fry pan and melt 2 large tablespoons lard, put in 1 large onion sliced fine and 1 clove garlic and fry. Then add enough flour to take up lard, then add water and stir until it makes thick gravy, add tomatoes as many as desired to make the gravy red, salt and pepper to taste. Then add pounded jerky and let cook slowly about 20 to 30 minutes.

II

Pound and shred jerky as directed in first recipe, place ten or twelve large dry red chillies in kettle, cover with water and boil until soft, then pour out and put in about a quart cold water and squeeze chillies until all meat is from skin, then strain through fine sieve. Place fry pan on stove and melt 2 large tablespoons lard, slice 1 large onion, garlic if desired, and fry until brown. Add enough flour to take up lard, then add the strained chillie juice. If you don't have enough chili to make medium gravy add more water, salt and pepper, then put in shredded jerky and cook slowly for 20 minutes.

If these recipes will help the Cultivator or any of the readers, I am glad to tell them. My husband has been a subscriber for the Cultivator for some time and we both enjoy reading it. Along about Christmas I would like to send you a good pudding recipe, one I made myself and use often and know it is good.—Mrs. E. A. Goodchild, Sisquoc.

RUGS AND RUG MAKING

There are three very good reasons for discarding carpets and using rugs: they are not as expensive as carpets; they are more easily cleaned; they wear longer because they are loose from the floor. But the main reason is to promote health.

There is no better way to utilize worn out garments and scraps of all kinds than to fashion them into pretty and serviceable rugs. Anyone can make braided rugs and they are very neat and durable. The long or square rugs are the easiest to make. For a long rug, take five strands, cut according to thickness of cloth, and leave three or four inches at the end before commencing to braid. Fasten firmly, then braid over and under, first on one side and then on the other, and braid closely. When the braid is the length you want the rug to be when finished, leave four inches of the strands as at the beginning to make the fringe, which should be cut into fine fringe when the rug is finished. The rug can be made as wide as wanted by sewing the braided strands together. The finished rug should be sewed to a stout foundation to make it stronger.

The woven rugs seem more popular than any other, and cutting and sewing the pieces makes pleasant work for leisure hours.

Rag rugs may be washed like any other heavy material, and washable rugs and washable floors are essential to good health. Both large and small rugs can be wonderfully freshened by first sweeping very thoroughly and then going over them with cloth wrung frequently out of a light suds made with dissolved borax soap chips. If very soiled they should be tacked to a clean floor and scrubbed with a small brush dipped in a stronger suds made with the soap chips, then rinsed quickly.

After sickness in the family it is always advisable to wash the floor covering, and this suds not only cleans well but is a fine disinfectant. Rugs of any color or quality can be cleaned with this suds without injury. Shake rugs by holding them by the middle part, never by the ends, and if very dusty hang them on the line and beat lightly with a small whip or rattan rug beater. Sew strips of buckram along the edges of rugs which have a tendency to curl up.

A large rug will last twice as long and be much easier to walk on if the floor is padded a quarter of an inch thick with old newspapers before putting down the rug.—A. M. H.

CAN'T PROVE IT

Yeast—It is said if the heat and muscular effort expended by the average man in a day could be converted into electrical energy it would be sufficient to run a sewing machine motor for 100 hours.

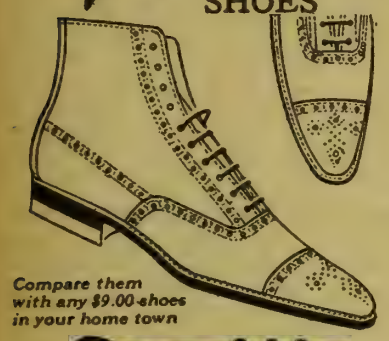
Crimsonbeak—Then why in thunder can't the average man crank a flivver more speedily?

WISDOM IN PARAGRAPHS

You can buy four Russian rubles for a cent, but nobody who has any cents will do it.—Peoria Transcript.

He is happy whose circumstances suit his temper; but he is more excellent who can suit his temper to any circumstances.—Hare.

$4.68 On Arrival for these Genuine WERNER SHOES



Compare them with any $9.00 shoes in your home town

Send No Money

Simply fill out and mail the coupon at the bottom of this ad. We will deliver the shoes immediately. When you receive them hand $4.68 to the postman. That's all. He will forward the money to us. Try the shoes on, compare them with any $9.00 shoes in your town. If you are not satisfied in every way—with the fit, the style, the workmanship, the finish, the material, return them to us, at our expense. We will refund your money in full at once, without question. After 78 years of "Werner" shoe merchandising we cannot afford to have one dissatisfied customer.

WHALEY SALE A BARGAIN EVENT

The dispersal of the Eldorado Holstein herd owned by Alex Whaley of Tulare proved to be one of the bargain events of the year. Fifty-three head of exceptionally well bred cattle were sold for an average of $268. At such a level of prices buyers were able to add to their herds breeding material that cannot fail to prove highly attractive investments.

R. C. Sturgeon of Tulare was the lucky buyer of the great young bull, King Tola Korndyke Pontiac, a son of the popular King Korndyke Pontiac 20th and out of the well known cow, K. P. Tola, a 36 pound daughter of King of the Pontiacs. The price paid was $1,900, which was also the top of the sale.

The females sold at a fairly uniform and distinctly conservative level. The top female was two year old heifer, Eldorado Winifred Aaggie, that went to B. F. Longan of Tulare for $650. W. J. Higdon of Tulare paid $550 for Jeanie Veeman of Sunnyside. M. P. Christensen of Norwalk, Sargent Bros. of Tulare, F. M. Helm of Fresno and Walter Packard of Delhi competed for the more attractive lots.

A feature of this sale, as well as the other two of the same week, was the way buyers shied at the young things. It has been a long time since a man could pick up well bred heifers at prices that will show as great appreciation. Men who have feed should find this fall a rare time to select young stuff to grow out.

A representative list of sales appears below:

BULLS

1, King Tola Korndyke Pontiac, April 1920; R. C. Sturgeon, Tulare, $1,900.

FEMALES

3, Melba Hengerveld, July 1911, 30.37 lbs.; Robt. Curtis & Son, Exeter, $500.

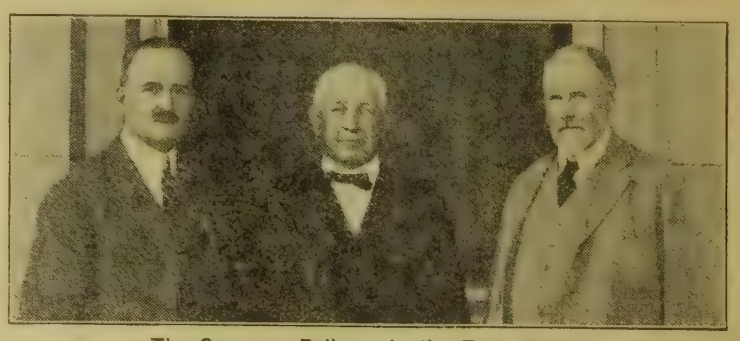
40, Patricia Segis De Kol, Aug. 1919; W. B. Naugle, $240.
42, Unnamed heifer, dau. of 39; Sargent Bros., $200.
43, Eldorado Queen, Oct. 1916; Walter Packard, $280.

Champions at California State Fair 1921

At the left of the photo is junior champion heifer, Juliana Dichter Fobes of Rock, and at the right is grand champion bull, Dichter Spofford Korndyke Lad 5th, property of George Junior Republic, Chino.



The Governor Believes in the Farm Bureau

Governor Stephens has just joined the Sacramento County farm bureau. This makes him a member of the state federation. The above photograph was taken at the time of his signing. At the governor's right is Dr. W. H. Walker, president of the state federation, and at his left is Fred H. Harvey, president of the Sacramento County farm bureau and member of the National Dairy Committee of Eleven.

Asked for an expression of his opinion of California's farm bureaus, Governor Stephens said: "Realizing that agriculture is the basic industry of California and that every constructive movement for its betterment is a step toward the development of the entire state, I note with welcoming relief the constructive and conservative force of a rural awakening reaching from the school house center to the county, state and nation, through such organizations as the California Farm Bureau Federation and the American Farm Bureau Federation."

CURTIS HOLSTEINS AVERAGE $228

Robt. T. Curtis & Son, Exeter, held their first public sale of registered Holsteins at Tulare, October 5, and made an average of $228 on 45 head.

The top of $1,125 was made with the 34 pound cow, Coloma Beauty Butter Maid, at which price she became the property of H. C. Ball of Tulare, who is establishing a high class herd. Her August, 1920, heifer calf by the $12,000 King Korndyke Pontiac 20th was purchased by Sargent Brothers of Tulare for $875. Sargent Brothers, who were among the prominent buyers, are extensive lemon growers and are making their plans to establish a large

41, Lucella Niko Pontiac Pietertje, Aug. 1919; Jessie A. Guerin, $260.

WALKER OPENS FALL SALES SEASON

The first sale of registered Holsteins of the fall season was held by S. O. Walker of Visalia. Fifty-four head, including many young things, none of which sold subject to a tuberculin test, averaged $170. While that figure represented a low appraisal, it can be taken as an indication of the attitude California breeders are manifesting toward cattle that have not been tested and makes plain that breeders who prefer to sell without testing their cattle can expect to be penalized.

J. R. Crawford of Burell was one of the heaviest buyers and selected many bargains. He was particularly fortunate in getting the aged bull, King of the Black and Whites, for $510. The same buyer topped the females when he secured the good cow, Lottie Walker Spofford 3d, for $350.

C. C. Ellis of Exeter and J. S. Allen of Visalia were also extensive buyers.

The sale was managed by the California Breeders Sales and Pedigree Company and Col. Ben A. Rhoades was the auctioneer.

A list of representative sales follows.

BULLS

1, King of the Black and Whites, Feb. 1911; J. R. Crawford, Burrell, $510.

FEMALES

4, Lottie Walker Spofford 3d, 25.41 lbs., Nov. 1913; J. R. Crawford, $350.
7, Manteca De Kol Tehee Korndyke, Oct. 1919; C. C. Ellis, Exeter, $175.
8, Manteca Tehee De Kol Korndyke, Oct. 1919; J. S. Allen, Visalia, $180.
9, Manteca Korndyke Walker, Oct. 1918; C. C. Ellis, $200.
12, Manteca Walker Erma Netherland, April 1919; J. S. Allen, $210.

MAKE YOUR PLANS NOW
TO VISIT THE

California Livestock and Horse Show

San Francisco, October 22nd to 30th

Four acres under canvas will house the greatest stock show ever held in this city and a show that will rate, judging by the entries to date, with the best livestock shows of the West.

Some of the finest American herds of Shorthorns, Herefords and Aberdeen-Angus have been entered, together with Holsteins, Jerseys, Guernseys, Ayrshires, several breeds of draft horses and sheep, poultry and pet stock.

The Horse Show will be held nightly. For this there have been entered some of the finest animals in the West, including drivers, saddle, hunters, jumpers, polo and other ponies.

Upon the success of this show depends the establishment of a permanent livestock show at San Francisco. Every livestock breeder should do his share to make the show a success.

First Prize Get of Sire, 1921 California State Fair. Sired by Beau Blanchard 76th.

NEVADA HEREFORD RANCH

Owned by J. H. Cazier & Sons Co., Wells, Nev.

WILL SELL AT PUBLIC AUCTION

80—Real Foundation Herefords—80

State Fair Grounds, Sacramento, Cal.

Tuesday, November 1, at 10 A.M.

This excellent offering is without question the best large group that has ever left Nevada Hereford Ranch, a herd that has forged ahead to the foremost ranks of American Hereford herds solely upon the quality of its cattle and the constructive policies of its owners.

Over 70 females and 5 or more young bulls of herd heading calibre will make up the sale list, presenting a most attractive selection in the Harris Standard 2nd—Beau Blanchard 76th combination that is proving so successful in this herd.

Young cattle of this breeding were the outstanding feature of the 1921 California State Fair classes, where they were consistently placed above winners in some of the best Middle West shows, proving conclusively that this herd is producing a class of cattle able to hold their own in any company.

Attend this sale if you want to build upon a real foundation, or if you wish to strengthen an already established herd.

This Is a Federal Accredited Herd

LIBERAL TERMS OF SALE: Responsible parties may arrange for credit before sale, with the sale managers, on the basis of one-half cash, balance in six months, with approved note bearing eight per cent interest.

DISPERSAL SALE

40 Registered Holsteins
20 Grade Holstein Cows and Heifers

Dr. F. H. Shanks & Sons Herd, Susanville, Cal.

Saturday, October 29
at 10 A.M.

Because two of his sons have taken responsible positions in other lines of agriculture, Dr. Shanks has decided upon a complete dispersal of his high-class dairy herd containing the animals noted above.

The herd contains a splendid lot of heavy producing cows of good breeding, and will be presented on sale day in good physical condition. An exceptional opportunity for buyers in the northeastern counties and in Nevada to buy good Holsteins near home.

EVERY REGISTERED ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

TERMS OF SALE: Responsible parties may arrange for credit on the basis of one-third cash, balance in 3, 6 and 9 months, with approved notes bearing eight per cent interest, if arrangements for credit are made before sale with the sale managers.

ENCOURAGEMENT FOR PRODUCERS

By A. L. Spellmeyer

CATTLE seem on a firmer level than for many months. Sales are claimed at advanced prices, and finance in unlimited millions has placed a solid support to the livestock industry.

Cattle have been hit hard by drouths as well as low market prices, and a shortage appears locally as well as in the entire U. S. A. in beef production. Drouths have given place to good grass and every prospect for a fine year in California. Now that money is available through the war finance corporation we may expect to see cattle bring their production cost. The cheap, less than production cost, era is apparently about to pass in the cattle industry.

Apparently less than 25,000 beef steers and cows are in sight for the Los Angeles market during the next few months to fill a normal 65,000 slaughter. At this period of the year a normal beef supply obtainable from California beet tops and grass and feed yards, Imperial, Phoenix, Inyo, Nevada, Utah and Northern Arizona would be about 80,000 head.

Much of the information and cattle dope put out on the Los Angeles market is misleading, numbers obtainable are grossly exaggerated and prices of offerings made lower than fact as the killers are persisting in fighting just advances to producers.

Early storms will without question cut possible supply from Northern Arizona, Utah and Nevada, as most of the fall beef is grown in higher altitudes where early snows and blizzards will prevent range gathering and scatter cattle.

An investigation of prices paid for carcass beef and prices charged for meat by retailers, recently made by an official of the cattle association apparently justified a retail price scale ranging from 45 cents for T. bone steak to ten cents for cheaper cuts. The comparison was made on carcass beef at 12 to 14 cents. An advance of two cents was claimed in Los Angeles carcass meat price in last ten days of September. However, among certain shops a different price scale is shown for carcass beef, giving prices of ten cents for cows and 11 cents for steers charged on the 27th day of September. This would indicate that retail profits are still too large. Many Los Angeles retailers still charge 55 cents for short yearling lamb chops, and such a charge is gross profiteering.

It would appear that the rosy day for the retailer is coming to twilight. Few economic evils continue without breeding their own cure. With the abolition of food war restrictions and the laws against profiteering declared null and void, a bright dawn of a day of profiteering orgy opened for the retail trade in food. Producers were ground to a low price, far less than cost, and consumers received no benefit, as this middle margin was absorbed by retail sources.

Retail stores increased in numbers, volume of trade did not increase though labor, light, and rentals piled upon that volume. There is still a margin for great price advance to cattlemen and no advance to consumers, but the inevitable is due when the retailers are going to be squeezed between those same millstones that have ground down and mangled the cattle producers. Producers must have a just price and consumers will object to any considerable advance.

One small suburban town near Los Angeles of 5,000 people indicates present trends so plainly it is worthy of note. In the last six months the number of retail meat and grocery shops has doubled. None is making money as the overhead doubled and business volume was split in half. Price cutting for volume started and the end is that some of these stores will go under.

For the California farmer, rancher and livestock man, every indication is that better times are right around the turn. It is true that feeds are down, but many feeds and much forage were on an inflated base. We can grant it impossible for the alfalfa rancher to sell hay under $20 per ton from $400 an acre land and high priced aqueduct water, but that $20 per ton is over double the average U. S. alfalfa price

for 1915 and 1916. The remedy is plain enough when this same expensive land and water can produce 30 to 50 tons silage corn to the acre and 20 to 40 tons of stock beets. This land must change its crop as the money is in the land, but a different method must bring it out.

The thousands of idle men flocking to the gentle California winter climate insure sufficient labor.

The small ranchers and farmers are going back into livestock. Hundreds of them are today figuring the Milking Shorthorn versus Holstein or Hereford, and hundreds of new men are today in the market for a few cattle here and there. With present grain prices the hog trade is profitable.

Continued stability will cause a rush into livestock by small California farmers, and that stability will be insured when a small part of this billion War Finance Corporation money has been distributed.

ANOTHER CALIFORNIA JERSEY COW BREAKS A RECOD

Another California record for Jerseys has been broken, this time in the junior two year old class, by Golden Duke's Pet. Her test was begun at two years and five months of age, and she produced 9380 pounds milk, 573 pounds butter fat, Class AA, and she carried a live calf 215 days during test. The following history of the raising of this heifer and the varieties of feed she has consumed has been furnished by her owner, O. S. Siegler, of Pacific Grove:

"She was fed whole milk the first week, gradually worked on to calf meal entirely at the end of the second week. She was fed calf meal and warm water until she was old enough to readily eat grain and hay. I had a box about three feet long, two feet wide, six inches deep set about two feet off the floor. In the back I kept alfalfa meal, in the front a mixture of coarse ground oats, peas, bran, corn and linseed oil meal, mixed at about the rate of two pounds oats, two pounds bran, two pounds corn, two pounds peas, one pound linseed oil meal. This was before her at all times, as was good quality of peas and oat hay. When she was four months of age she was shipped to California from Washington and was out of my care for the next year, but was in a small corral without pasture and fed dry alfalfa hay, and a slight change was made in the grain mixture, eliminating peas and substituting barley. When about a year and a half old, I brought her to Pacific Grove. She continued to get this feed until about two weeks before she freshened, when she was cut to oats, bran and oil meal in equal proportions, receiving about four pounds a day. She has never had the run of a larger corral than a quarter of an acre."

CALIFORNIA AYRSHIRE BREEDERS TO ORGANIZE

Ayrshire breeders throughout California are manifesting quite an interest in the proposed California Ayrshire Club. Preliminary plans are now being made to hold a meeting for this purpose some afternoon or evening during the California National Livestock Show to be held in San Francisco, October 22 to 30. Every breeder of Ayrshires whether he owns one purebred bull or a large herd of registered animals is invited to be present. An effort will be made to secure several reels of moving pictures showing the national sale of last year.

WHAT WOOL MEN WANT

What does the wool producing industry need most? This question was asked of the wool marketing department of the American Farm Bureau Federation by congressional joint commission of agricultural inquiry. Director C. J. Fawcett answered:

"1. Adequate financing, loans to run for not less than 30 months. 2. A more favorable attitude by the federal reserve system toward financing agricultural commodities upon warehouse receipts as collateral. 3. A federal law permitting cooperative marketing of agricultural commodities, thereby putting in practice a more economical method of distribution to consumers. 4. A tariff just to both manufacturer and consumer. 5. A Truth-in-Fabric law, benefiting both producer and consumer. 6. The dissemination of knowledge to the public as to cost of raw commodities compared with finished products."

$7.50 After 30 Days Free Trial

A King Segis Pontiac Offering

102 REGISTERED HOLSTEINS 102

SYCAMORE ACRES, Owned by Robt. N. Clapp, Nuevo, Cal.

SELLING AT

Rhoades & Rhoades Sales Pavilion, Hynes, Cal.

Friday, October 21, at 9:30 a.m.

This is without question the greatest offering of the blood of King Segis Pontiac ever made in the west, including high record cows and daughters of such cows, and a wonderful lot of individuals.

20 DAUGHTERS OF KING SEGIS PONTIAC
All young, many out of high record dams of most attractive breeding, and including a number of high class show quality.

31 DAUGHTERS OF PEARL KING SEGIS PONTIAC
Who is by King Segis Pontiac and out of a 37.51 lb. daughter of Pontiac Korndyke that milked 753.9 lbs. in 7 days, second dam a 727.03 lb. yearly record 4 year old daughter of Pearl of the Dairy's Joe De Kol.

13 DAUGHTERS OF KING PONTIAC NETHERLAND SEGIS 3D
The famous young sire formerly at the head of the Rosamaines Rancho herd. He is sired by a grandson of King Segis Pontiac and out of the twice 34 lb. cow Gerben Abbekerk Maid. His daughters in this sale are a wonderful group of young females, with records up to over 30 lbs. butter in 7 days for a 4 year old.

3 DAUGHTERS OF KING SEGIS PONTIAC CHICAGO
Who sold for the then world's record price of $20,000.00 when a calf. He is by King Segis Pontiac and out of the 40 lb. cow Johanna De Kol Van Beers.

7 DAUGHTERS OF PAUL CALAMO KORNDYKE
The great show bull that has many Grand Championships to his credit in the best shows. His daughters in this sale include the famous National Dairy Show winner Nancy Calamo Korndyke.

FOUR 30 TO 34 POUND COWS
Including the great twice 34 lb. cow Gerben Abbekerk Maid, now making a splendid strictly official yearly record in her tenth year.

If you are looking for young cattle with splendid type and rich King Segis breeding, you will find in this offering one of the choicest lots ever sold in California.

WILL OFFER

51 REGISTERED GUERNSEYS 51

AT PUBLIC AUCTION

Rhoades & Rhoades Sale Pavilion

Hynes, California

Thursday, October 20, at 10 A.M.

THE FEMALES:

There will be 41 females in the sale, all heifers, and practically all are bred. A large number are bred to MASTERPIECE OF EDGEMOOR, one of the greatest young sires of the Guernsey breed, also some to the undefeated show bull DEANIE'S MAROSE OF APPLETREE POINT.

The offering includes granddaughters of Governor of the Chene, Spottswood Daisy Pearl, Rose of Lanwater and a considerable group sired by a double grandson of Governor of the Chene.

These choice heifers should meet with the approval of the many prospective buyers who wish a foundation of young registered Guernsey females of substantial breeding and bred to bulls of unusual merit.

THE BULLS:

The ten bulls in the sale list include a number ready for service, of desirable type and approved breeding, and should find favor with both breeders and dairymen.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO 60 DAY RETEST.

TERMS OF SALE: Cash unless arrangements for credit are made prior to sale with the sale managers, California Breeders Sales and Pedigree Co., who will extend terms of one-third cash, balance in three equal payments in 3, 6 and 9 months, to responsible parties, with approved note bearing eight per cent interest.

Jack Klein who has represented the livestock department of the Cultivator for the last year has taken over the management of the Maxwell Farms in the San Fernando Valley. This farm boasts one of the largest and best herds of Holstein cattle in California. Mr. Klein remains with the Cultivator in the capacity of an associate livestock editor and his services will be available to our readers in the future as in the past.

California breeders of Ayrshire cattle are planning to hold a meeting during the week of the California National Livestock Show for the purpose of organizing a state association. California now has a number of very high class herds of this popular Scotch dairy breed.

W. A. Clark, Petrolia, who has been in the East purchasing Shorthorn and Hereford bulls for Humboldt County ranchmen, secured five of the first named breed from Colorado breeders. It is rather strange that some California ranchers feel it still necessary to go East to purchase range bulls when they can usually find as good or better in California herds.

The Arizona Hereford Breeders Association is planning to hold a sale of grade Herefords at Kansas City, November 12. The plan is to offer from 1,500 to 2,000 head of calves, yearlings and cows in carload lots at public action.

C. N. Hawkins of the Pacheco Cattle Company, Hollister, reports the death of their senior herd bull, Pacheco Lad 58th. Pacheco Lad 58th was sired by Truedale and had distinguished himself by siring a number of prize winners. He was the sire of the winning two year old heifer, the second prize junior yearling heifer and the second prize group in the get of sire class at the last state fair.

Judge Peter J. Shields of Sacramento, president of the California Jersey Breeders Association, has purchased 11 young females and a bull from George V. Saffaram of Missouri. Judge Shields is one of the most ardent Jersey enthusiasts of California and it is his intention to develop one of the leading herds.

Geo. Knight of the Los Angeles County Cow Testing Association, gives the following summary of his year's work: Number cows tested nine months or more, 2,217; average pounds milk, 8,772; average pounds fat, 353.4; cows making over 700 pounds fat, 4; cows making between 600 and 700 pounds fat, 22; cows making between 500 and 600 pounds fat, 103; cows making between 400 and 500 pounds fat, 360; cows making between 300 and 400 pounds fat, 794; cows making between 200 and 300 pounds fat, 934.

C. V. Castle, who has been in charge of the cow testing association work in the western office of the dairy division, has been transferred to Delhi. Mr. Castle is dairy field agent on the Delhi project, where an effort will be made to demonstrate the value of a dairy specialist in developing a dairy community.
